It is with pleasure that I perceive the increasing interest in our forests which is appearing through the country, and especially in California. It is with pleasure that I can report a marked decrease in forest fires where we have been able to send our officers and fire notices. These forest fires are a desolation. Beautiful mountains covered with verdure, the home of the beeman and the settler, the crops of the farmer, the lumber of the woodman, all are ruthlessly swept away by them and a scarred and blackened landscape takes the place of beauty and plenty.

It gives me pleasure beside to say that there is a good prospect for the recovery to the schools of the value of timber taken from school lands. We shall introduce an Act in the next Legislature withdrawing these lands from sale and placing them in the control of the State Board of Forestry.

After Mr. Kinney's address the following resolutions, proposed by James Bettner of Riverside, were adopted:

Resolved, That it is the sense of this convention that all unsold school and other timber lands belonging to the State in the State of California should be withdrawn from entry and sale, and that all such timber lands should be placed by the Legislature under the control and management of the State Board of Forestry, and full powers granted to that board to control the sale, renewal and preservation of the timber upon them;

Provided, That all funds accruing from timber sales or otherwise shall be turned over to the State School fund by said board after the necessary expenses of sale and management shall have been deducted.

Resolved, That the secretary of this convention be, and hereby is, instructed to forward a copy of this resolution to the next Legislature as soon as convened.

A measure which won much favor was the effort to save a fine representative of our redwood forests which still stands in San Mateo county. The following resolutions by R. S. Smith of Redwood were adopted after favoring remarks by Dr. Kimball of Haywards and others:

Whereas, The rapid destruction of the redwood forests of this State will entail permanent loss to the beauty of our coast counties and al-

ready threatens the water supply, and consequently the fruitfulness and healthfulness of those counties; and

Whereas, The perpetuation of a large tract of coast redwood will be of continuous economic value and of continued and increasing interest to science;

Resolved, That the Eighth Convention of California Fruit-Growers hereby indorse the effort of the California State Board of Forestry in seeking to secure the reservation of such a tract of redwood forest, and recommend the project to the earnest consideration of our representatives in Congress.

Since the Santa Rosa convention the Forestry Commission have had a meeting in this city and have set in motion measures for the establishment of forestry stations where promising varieties of forest trees, native and foreign, will be propagated and their growth noted, and from these stations seedlings will be distributed for trial planting throughout the State. Land has been offered the board at Santa Monica and at Pasadena, and other offers of land in the upper part of the State are now under consideration. The Forestry Commission evidently intends to push its work, and we are quite sure that it will be sustained by public sentiment in its beneficent efforts.

BEREAVEMENT.—We announce with a deep feeling of sympathy the death of Mrs. Nellie Yale Vance, daughter of the late Gregory Yale and sister of our esteemed editorial associate, Charles G. Yale. Mrs. Vance has been suffering for many months with pulmonary disease, and though every known means was tried to avert the malady, it was without avail. She sank slowly from day to day, and it was only a few hours before her death that she became the wife of Mr. G. P. Vance, her faithful betrothed, who had hoped and waited until no chance remained for her recovery and then claimed his bride. The funeral was held on Wednesday afternoon at St. Stephen's church in this city, the rector, Rev. E. J. Lion, officiating. There was a large concourse of mourning friends present. We can but express our heartfelt sympathy for the bereaved ones, and this is all that can avail amid such scenes.

AN EARLY OLIVE.—Mr. A. Montpelier, manager of the Grangers' Bank, sends us a twig of an olive tree bearing fully ripened and dried fruit of an olive which ripened at his place in Solano county in September last. It is a good-sized olive, for the dried specimens are an inch to an inch and one-eighth long. It is an early bearing variety, for it is now but 2½ years since the trees were set out, and they were then small, having been imported from France in 1885. Each tree of this variety bore over 500 large olives this year. Its early ripening will also attract much attention. The variety is what Mr. Montpelier calls in English the "Weeping olive." Its name in the dialect of Provence, where the variety originated, is "Corniaon," and in French it is *Olivier Pleureur*. The variety is extensively grown in Provence. We hope to give fuller information about this variety later, as it bids fair to be famous.

THE DRIVEN-WELL PATENT INVALID.—A dispatch from Washington brings the welcome news that the "driven-well patent," which has been several times before the Supreme Court, and always been sustained heretofore, was on the 14th, declared invalid in an opinion by Judge Blatchford, based upon the record in case No. 16, Andrews, Green and others against Geo. Hovey, brought here on appeal from the U. S. Circuit Court for the Southern District of Iowa. The decree of the Court in favor of the alleged infringer, Hovey, is affirmed.

BET SUGAR.—It is reported that Claus Spreckels, in company with W. T. Garratt of San Francisco and George A. Smith of Courtland, two of the owners of the beet-sugar factory of Iseleton, recently visited and made a full examination of the factory, and it is to be hoped that Mr. Spreckels will take hold of the works and start them up during the coming year. The people of Iseleton are much pleased over the prospect of the factory being started up.

COMMISSIONER SPARKS of the General Land Office has resigned, on account of differences between himself and Secretary Lamar as to railroad land-grants, and the President has accepted his resignation.

ARIZONA STOCKMEN are making large sales of beef cattle. They claim that all the ranges are overcrowded, despite the fine pasturage.

Feeding for Fat or Lean.

During the last few years there has been considerable progress made in ascertaining the effect produced upon the animal body by different kinds of food. The Agricultural Experiment Stations of Europe and of this country have given much attention to this work in the interest of the stock-grower. We are glad to have opportunity of illustrating on this page the actual results obtained at the Wisconsin University Agricultural Experiment Station under direction of Professor W. A. Henry, in a set of experiments carefully made to determine the different results which followed a straight corn diet and one in wheat; other materials were also introduced. The following is a description of the experiments from Professor Henry's report recently issued:

Out of a litter of eight pigs, six were selected, which were even in size and form, for the trial, when they were 100 days old. Up to the beginning of the trial, the pigs were all fed alike, from the same trough, a mixture consisting of shorts, cornmeal, skim milk and buttermilk. The pigs were cross-bred Jersey Reds and Poland Chinas. At the beginning of the trial the six were divided into two lots of three each, and to Lot A was fed a ration consisting of one part of dried blood, six parts of shorts and 14 parts of skim milk by weight. To Lot B was fed all the fine-ground cornmeal they could properly consume. Water was freely provided for each lot, and each had the run of a small yard back of the feeding-pen in which exercise could be taken; all went on with remarkable uniformity from first to last, with no accident of any kind to either lot during the whole period of 136 days. The following shows in a condensed form the amount of food consumed by the two lots during the trial of 136 days:

LOT A, FED FOR LEAN.	
Pounds.	
Sweet skim milk consumed.....	3,402
Shorts consumed.....	1,415 1-7
Dried blood consumed.....	235 6-7
LOT B, FED FOR FAT.	
Amount of cornmeal consumed.....	1,690
The digestible matter in the food fed to the two lots was as follows:	
Protein.	Carbohydrates.
Pounds.	Pounds.
Total to Lot A.....	833
Total to Lot B.....	1,193

It will be seen that each lot received about the same number of pounds of actual food, but that the proportions of the protein to the carbohydrates varied greatly. Protein goes to make muscle, though it may be used for heat and fat in the body. The carbohydrates (starch, sugar, etc.,) cannot make muscle in the body of an animal, though they may save it from waste and decay, but are used for maintaining the bodily heat and for making fat. Our corn-fed hogs then were fed a very fattening food, while the other lot were given a large amount of muscle (or lean meat) making material. Here we have our facts so widely different in character that the effect should be very evident in the carcasses of the hogs, if the character of the food affects the composition of the body.

The hogs were slaughtered Nov. 8, 1886, a skilled butcher assisting, every operation being conducted with great care and precision. After taking the live weight of each animal, it was killed by slow bleeding and the blood caught and weighed. The viscera were taken out and each organ weighed and the dressed hogs hung up to cool and stiffen.

Upon being taken to the block, each dressed hog was laid on his back, and first the head was severed, next the body was cut square across between the fifth and sixth ribs, and again at the loin or small of the back. A painter was employed to sketch the appearance and disposition of the fat and lean meat as exposed by the cuts. Fearing the painter was not exact enough, a photographer was employed for the same purpose, and we were thus enabled to preserve for future reference and

study that which would have otherwise soon been lost. The engravings which are herewith presented show the proportion and disposition of the fat and lean in some of the cuts. We present six illustrations, three of each lot. The first two engravings show what we found on severing the heads of the first hog of each lot. The second two show in the same way the cuts made between the fifth and sixth ribs of the hogs, numbered "two" in each lot; while the last two engravings show the loin cut of the hogs

of Lot B. The most remarkable difference, though, is in the small of the back, where it will be noted that Lot A has about twice as much muscle as Lot B.

Accurate Accounts of Results.

Most accurate dissections were made of the different organs and parts of the body, and all were carefully weighed. The following table gives the most important facts in the case, the weights being of three hogs in each lot:

1. That there is an excessive development of fat not only on the outside of the muscles and beneath the skin, but also among the muscles.
2. That the muscles of the body fail to develop to their normal size, especially some of the most important ones, as those along the back.
3. That an abnormally small amount of hair and a thin skin result.
4. That while the brain, heart and lungs do not seem to change in weight, the spleen, liver and kidneys are unusually small.
5. The amount of blood in the body is greatly reduced from the normal.
6. The strength of the bones may be reduced one-half.

It would seem that we may conclude that a system of feeding which robs the hog of half his blood and half the natural strength of his bones, and produces other violent changes, is a most unnatural one, and must, if persisted in, tend in giving us a race of animals which will be unsatisfactory to all concerned. From parents thus weakened must come descendants that will fall easy victims to disease and disaster. Knowing the facts as here set forth, can we any longer wonder that our hogs are weak in constitution and easily break down when attacked by disease? Nor is this all; the meat from such animals can hardly be of flavor and composition satisfactory to the consumer.

How to Improve.

If even a part of what has been set forth is correct, is it not high time we turned our energies toward better methods? To do this calls for higher thought, better care, but I fully believe no extra outlay of money; rather, I believe, we can feed hogs more profitably by rational methods than by the unscientific and shiftless ways now only too common. First of all, we must see to it that breeding sows are fed a proper ration in which protein compounds form a liberal share. The young pigs must likewise have a goodly allowance of protein, while the mature hogs, when fattening, can be fed a large proportion of carbohydrates, especially if we wish to make a large proportion of lard. The food articles at our command which are rich in protein are skim milk, buttermilk, shorts, bran, peas, green clover and the like. No farmer can afford to manage his farm with a minimum of these muscle-making foods; they should be supplied abundantly and at a reasonable cost if we will only study to do so.

Shall we raise less corn, then? Not at all. The corn crop is the best of all we raise, and let the word be "more," rather than less. We need it all, but we must not forget that protein is somewhat lacking in the corn. We may compare our corn to the brick which go into a building, and the protein foods to the mortar which cements the brick together. He who would lay brick without mortar builds foolishly, and his house will tumble. Should he find out his mistake, such a man should not from that date neglect the brick and turn his whole attention to the mortar. Plenty of good strong mortar and an abundance of brick are what he needs. We do not want less corn, but we want more clover, more shorts, more bran, more peas, more skim-milk to bring the highest results.

Rational Rations.

Without attempting to give any exact rules for guidance, the following statements may not be out of place: During gestation, breeding sows should have only a small allowance of

corn, the feed being mainly that which will go to give her young good sound bodies. Such feed would be shorts (middlings or shipstuff), bran, skim-milk, butter-milk and clover. When suckling her young, of course milk is one of the best articles at our command. When weaned, the pigs may get say two parts of milk by weight, one part of shorts and one part of cornmeal.

A run on good clover would go far to make a good frame. When nearing maturity the ration can be changed more and more to the carbonaceous, and for the last two months, when fattening, the feed can be largely corn, if one desires fat pork, but if lean, juicy meat is desired, the muscle-making foods must be continued.

PLATE I.—Cross sections showing the proportional size of the muscles (lean meat) in the necks of hogs No. 1 of each lot. NOTE.—The lean meat is striped black and white; the fat is shown in clear white. The cuts are made from the dressed hogs lying on their backs.

PLATE II.—Cross sections showing the proportional size of the muscles (lean meat) over the heart of hogs No. 2 of each lot.

PLATE III.—Cross sections showing the proportional size of muscles (lean meat) of the hogs No. 3 of each lot cut through the small of the back.

numbered "three" of each lot. In each of the engravings the dark-shaded parts represent lean meat or muscle, while the fat is shown by the white parts. As in cutting across the body at the three places named, we cut square across most of the muscles, the reader can see the relative size of each muscle, in cross section in two hogs of each lot.

The reader is asked to give these illustrations more than a passing glance—to study each. It will be seen in each case the muscles (red or lean meat) of the protein-fed hogs are larger than the same muscles of those fed the ration rich in carbohydrates. Even the muscles of the neck are stronger, as shown in the first two cuts. On the back over the heart, the muscles of Lot A show far less fat between them than

	Lot A.	Lot B.
	Fed for lean.	Fed for fat.
Total live weight.....	669 1/2 lbs.	581 1/2 lbs.
Total dressed weight.....	541 1/2 "	451 "
Total external fat.....	150 "	158 "
Total lean meat.....	244 "	178 1/2 "
Total weight of kidneys.....	27 oz.	19 oz.
Total weight of spleens.....	16 "	12 "
Total weight of livers.....	146 1/2 "	109 1/2 "
Total weight of blood.....	296 "	188 "
Breaking strain 5 thigh bones.....	4,650 lbs.	2,855 lbs.

Thus it appears that the hogs fed for lean gained weight in every item except the one of fat, and gained also strength of bone.

Prof. Henry claims that the experiments show that when we feed to our hogs a ration rich in carbohydrates but lacking in protein, like cornmeal, we will find:

1. That there is an excessive development of fat not

The Fairs.

Watsonville-Pajaro Valley.

Among the many Californian fairs which have been pronounced "a grand success" this fall, few have been more successful (we judge from the chorus of gratulatory accounts) than that held at Watsonville, Oct. 20th to 22d. The Opera-house was packed with admirable exhibits—agricultural, horticultural, floral and industrial—and visitors came in throngs every day and evening. The Pajaro Valley Fair Association, and notably the Watsonville Grange, has reason to be well satisfied with this outcome of its enterprise.

The opening exercises included an original poem, by Mrs. E. O. Smith of San Jose, which was read by Miss Esther Malcome with fine effect, and a neat address by A. N. Judd, president of the Board of Directors.

One of the first objects to catch the eye, on entering the tastefully decorated hall, was a pile of pumpkins—six in number and weighing altogether over half a ton—with the hospitable placard: "Take one"—an invitation of which nobody availed himself! Two sample hills of potatoes were shown, the yield from one of which (Peachblow) was 28 pounds, and from the other, a small, red variety, 26 pounds, and there were sweet potatoes, onions, tomatoes, cabbages, turnips and other vegetables to match the spuds, beets 26 inches in length, eight inches in diameter and of 30 pounds' weight, grown from the seed since May without a drop of water, and a sunflower half a yard across its face.

The exhibit of grain, in sheaves and jars, which Besse & Sill had at the Mechanics' Fair in S. F., was here to be seen again. It included wheat from half a dozen fields in the valley which this season averaged respectively 68, 70, 73½, 78 and 85 bushels to the acre; oats from two which yielded 60 and 70 bushels, and barley from three fields claiming 105, 100 and 119 bushels to the acre. Second-crop oats and barley, headed out nicely, was a novelty to newcomers. They also showed a fine lot of beans, from seven or eight different parties, and pop and sweet corn of extra quality.

In the horticultural division the fruits were disposed on semi-circular shelves several tiers in height. In the large and varied display of apples the eye did not detect a single blemished specimen nor one that showed any sign of pests. They were rich in color, firm-meated, of large size and elegant in form. Among the many fine Bellefleurs, a box of 45, weighing 50 pounds, exhibited by Capelli & Dondoro, were especially admired. (They have since been sent to Massachusetts.)

The pears were free from scale, and the Winter Nellis and Beurre Gris d'Hiver shown were remarkably fine. (The latter is a good shipper, having been sent to Glasgow, Scotland, where it arrived in good condition and sold for \$3 per box.) Thirteen Vicar of Winkfield pears on exhibition weighed 26 pounds. Pajaro berries are so famous it almost goes without saying that the strawberries, raspberries and blackberries were the perfection of their kind; and there were also to be seen pomegranates, persimmons, plums, oranges, limes, olives, almonds, walnuts and peanuts growing on the vines.

The leading exhibit of dried fruits was that made by the Watsonville Drying and Packing Company. In the center of the hall stood a pyramid, entwined with the leafy vines and laden with luscious clusters of Malvoisie grapes. Over the stage was the inscription

"PAJARO VALLEY PRODUCTS"

In letters of apples, divided in halves and artistically arranged in regard to color.

The floral annex, a temporary structure roofed with cloth, was lavishly adorned with hops and held a beautiful array of evergreens, ferns and flowers. Miss Law, botanist, exhibited 125 varieties of roses, all grown in the valley.

In the machinery and implement department were plows and cultivators made by N. McLean, and L. P. Helmer's patent orchard cultivator, as well as a variety of wind-engines, washing-machines, etc.

The various mercantile displays, the samples of work done by pupils in the public schools, the drawings and paintings, the specimens of needlework, of bread, cake, etc., prepared by the ladies and little folks, were very interesting in their way, and won extended notice from local observers; but we must refrain from speaking of them further.

Then there was the stock parade Friday, the baby reception Saturday afternoon—at which no less than four score little cherubs were shown by fond mammae—and pleasing musical and literary entertainments every evening.

Pres. Judd, Mr. and Mrs. Roache, Mrs. Dr. Libby, Mr. and Mrs. Uren, Mrs. Card, and all their zealous and able assistants, were praised without stint and warmly congratulated. The total receipts were \$1700; expenses, about \$800; balance, \$900.

Awards—Live-Stock.

FIRST PREMIUM—J. K. Meyers, short-horn Durham bull. Geo. D. Rodgers, mare and a colts, one family; 2-yr-old stallion. F. Devitt, gelding, horse of all work. J. A. Linscott, span roadsters. S. Rianda, draft mare. L. Hushbeck, mare of all work; colt; also 2d premium mare of all work. J. Curn, colt of all work. A. W. Condit, horse of all work; special mention for colt. McEwen Bros., horse; special mention on span roadsters. D. M. Clough, Southdown buck; pair bronze turkeys; pair Toulouse geese; 2d premium for Southdown ewes

and lambs; special mention for a gelding. J. Wintzen, pair Buff Cochins China chickens. L. Lorenzen, pair Curly chickens. Ruth Radcliff, Game Bantam; trio Seabright Bantams. Anderson Bros., Jap. Game fowls. H. Seigman, pair Bremen geese; Silver Spangled Hamburgs; Cotswold buck; Southdown ewe and lamb. T. Cowles, Trio Wyandotte fowls. Mrs. C. Werner, pair Poland chickens.

SECOND PREMIUM—J. M. Rodgers, draft horse. J. E. Trafton, colt. H. Seigman, mare, roadster. J. Rodriguez, horse of all work. M. Phelan, span of horses. W. S. Neal, mare, 2 yrs old and over, special mention.

Agriculture.

FIRST PREMIUM—W. S. Hunt, Hubbard squash; special mention for Danvers onions and yellow field-corn. D. M. Clough, sweet potatoes and oats. C. D. Trafton, stock bees. J. M. Rodgers, self-bleaching celery. J. T. Porter, Bayo beans, red kidney beans, Lady Washington beans. Mrs. E. Anderson, melons. L. Hushbeck, Jr., barley. Adam Martin, wheat, sheaf wheat. L. Hushbeck, timothy. G. Q. Bush, beardless barley, black oats, N. Y. Marrowfat beans. M. E. Martinelli, okra. W. A. Sanborn, Banana melon. L. & C. Rodgers, dry hops, baled hops. A. F. Richardson, Peerless potatoes. H. F. Haver, carrots. N. A. Uren, Citron melon. W. J. McGowan, Mojave seedling potatoes. Thos. Allen, red potatoes. G. D. Rodgers, sheaf red oats and growth, squashes, Belgian Hubbard squash, Yankee pumpkins. F. Therwacher, sheaf wheat, black Spanish radish. S. Estrada, Spanish peppers. L. Hansen, cabbage, potatoes. H. C. Struve, onions, cucumbers. J. A. Blackburn, popcorn, sweet corn. N. A. J. Dorn, Allison wheat, pink beans, white beans, yellow Dent corn. D. Tuttle, Peerless potatoes. N. Struve, flaxseed. Chas. Porter, Red Rose beans. Antone Rianda, field-corn. L. Castro, Chili peppers. C. Kuhlitz, large yellow corn. E. S. Bockins, lot vegetables, mammoth pumpkins. Besse & Sill, collection of cereals. F. Devitt, Peachblow potatoes. J. Berta, sheaf green barley.

SECOND PREMIUM—N. A. Uren, beardless barley. G. Q. Bush, field-corn. J. A. Blackburn, field-corn. W. H. Rowe, barley. J. R. Kitchen, white Belgian carrots. G. W. Peckham, Hubbard squash. A. McNeely, pumpkins. D. Tuttle, hill of Peerless potatoes. F. Devitt, hill of red potatoes, box Jersey Blue potatoes, jar Bavo beans. N. Dye, Jersey Blue potatoes. H. C. Struve, beets, cabbage. Mrs. M. B. Ercanbrack, tomatoes. J. H. Thompson, water-melons. J. M. Rodgers, Lady Washington beans. J. T. Porter, small white beans. Mrs. N. E. Thompson, beets. A. W. Condit, onions. M. Quick, sweet potatoes. W. J. McGowan, Mojave potatoes. N. Mansfield, flint corn. J. C. Drew, sheaf oats.

SPECIAL MENTION—Chas. Foley, Mrs. Chas. Werner, J. Jensen, wheat sheaves. N. A. Uren, oats. A. F. Richardson, beans on stalk. R. T. Grant, cabbage, carrots and beets. Mrs. G. D. Rodgers, potatoes, tomatoes and beans. T. Pegan, yellow corn. M. Silva, sweet potatoes. Thos. Stratton, sugar beets. Wm. Byrd, table beets and Dutch cabbage. A. T. Swart, mammoth cucumbers. F. Devitt, Peerless potatoes. N. Mansfield, white and early corn. C. Gullett, stock beets. J. A. Blackburn, roasting ears corn. G. D. Rodgers, barley and black oats. E. Scrivani, cabbage and tomatoes. A. W. Condit, cabbage and carrots. A. P. Roache, wheat. W. J. McGowan, wheat. Mrs. N. E. Thompson, carrots. J. M. Rodgers, tomatoes.

Horticultural.

FIRST PREMIUM—S. B. Marcus, green olives, Newtown Pippins. Capelli & Dondoro, box Bellefleur apples. F. Devitt, Smith Cider apples. M. Phelan, Fall Pippins, White Winter Pearmain apples. Chas. Galletly, Bellefleur apples. Mrs. Thos. Leland, Newtown Pippins, R. I. Greenings, Gloria Mundi. T. D. Alexander, W. W. Pearmain apples, Duchesse d'Angouleme pears. Jas. Rich, Alexander apples. G. Q. Bush, R. W. Pearmain, Newtown Pippins, Bellefleurs, W. W. Pearmain, Vandevere, Flushing Spitzenberg, Smith Cider, King of Thompson, Skinner's Seedling, and two other lots of apples. A. P. Roache, Smith Cider apples. L. J. Beckett, R. W. Pearmain. Santa Cruz Exhibit, Jonathan apples. J. Wintzen, Oregon Red apples. W. V. Gaffey, Baldwin apples. J. Waters, Baltimore Red and Red Canada apples, Coe's Late Red Plums; Seckel, Passe Crassane, Beurre Easter, Beurre Diel and Vicar of Winkfield pears. Wm. Palmat, grapes. L. Hushbeck, English walnuts. J. M. Rodgers, American black walnuts. A. W. Condit, drawer raspberries, drawer blackberries. I. Thurber, basket strawberries. Mrs. E. F. Sanborn, quinces. Mrs. J. T. Porter, pomegranates. D. M. Clough, oranges, Beurre Gris d'Hiver pears. Mrs. Mary Gilkey, case sun-dried fruit, case conserves, case sugared fruits. Watsonville Fruit Packing Co., each of following evaporated fruits: Apricots, peaches, plums, apples, French prunes, German prunes, Silver prunes, nectarines. T. C. Pearson, plate dried figs.

SECOND PREMIUM—Santa Cruz Exhibit, Alexander, and Smith Cider apples. Mrs. M. B. Ercanbrack, Crook-neck pears. M. Herbert, English walnuts. J. A. Blackburn, box Smith Cider apples, box Bellefleur apples. L. J. Beckett, Yellow Newtown Pippins. W. S. Hunt, R. I. Greenings. D. Brown, box Pearmain. Mrs. Meyers, six varieties apples. F. King, Muscat grapes. Mrs. J. A. Blackburn, English walnuts. W. N. Wilson, White Muscat grapes. Chas. Craugh, lot pears. Jas. Waters, Gris d'Hiver pears. S. L. Steigleman, sun-dried apples. C. Galletly, raspberries. J. A. McCune, evaporated fruits as follows: French prunes, apricots, peeled peaches, peeled apples.

SPECIAL MENTION—W. V. Gaffey, Smith Cider apples; M. Herbert, almonds; N. Dye, quinces; M. Phelan, strawberries; J. A. McCune, grapes; J. A. Blackburn, Newtown Pippins; L. J. Beckett, yellow Bellefleurs.

Machinery and Agricultural Implements. Best cultivator, L. P. Helmer; sulky cultivator, land plow, riding plow and display farm machinery. N. McLean: washing machine, R. T. Grant; 2d, F. King; wagon jack and seeder, W. T. Easterday; windmill, P. Freimuth.

Miscellaneous.

Best dairy butter, Mrs. J. Meyers; best ranch butter, Mrs. Rodgers; 2d, Miss T. Maxwell; best cheese, C. Silliman; 2d, McGrath Cheese Co.

In the floral department the committee decided to give every exhibit a premium, as it was difficult to

make any distinction where excellence was so general. A curious vegetable bouquet, exhibited at the Grange Booth by Jos. Butcher, received a premium.

Chico—3d District.

The Third District A. A. held its eighth annual fair at Chico, Oct. 11th to 13th. There had been considerable question about holding one at all this year, and doubters feared and unbelievers predicted that without horse-races it would not be a success. But when it came to the final test, farmers, mechanics, and citizens generally went to work with a will, and the result was a display unsurpassed, and some claim unequaled, by any of its foregoers.

Senator Stanford's superb cattle from the Vina ranch were viewed with admiration, and the stock parades were accounted the finest for several years, and second only to those at the State Fair. The line of thoroughbreds, draft horses and roadsters, jacks, jennets, and mules, bulls, cows and heifers, stretched over half a mile. There was a good showing, likewise, of sheep, goats, swine and poultry.

What with the handiwork of the ladies, the works of art and the implements and machines, added to the products of the soil, Armory hall looked beautifully. Among the many notable exhibits, that from the Rancho Chico was pre-eminent. It embraced 70 specimens of grain in sheaf, mammoth pumpkins and squashes, and fruits and vegetables in vast variety, besides a huge pyramid of flour, the foundation of which was 100-pound sacks, and the cap sacks of five pounds only.

The opening address was given by Prof. Richard White, and after him Gen. Bidwell spoke of the exhibition as testifying the goodwill of the people, especially the ladies, who, by their untiring efforts, had made it what it was, a successful fair, without pool-selling, gambling, or racing. The next evening a speech from Rev. E. R. Dille of Oakland was much applauded; and the last day the pavilion was again crowded with people eager to welcome Gov. Waterman, who appeared much pleased with their cordial reception.

The condensed extracts from the

List of Awards

Which we append will aid our readers to form some better notion of the scope and excellence of the exhibition:

Awards—Horses.

THOROUGHBRED—Stallions—Best 3-yr-old, Joe Hamilton, L. L. McDaniel; 2-yr-old, San Luis Obispo, J. H. Stevenson.

GRADED—Stallions—Best 3-yr-old, 1st, Steinmeyer, D. M. Reavis; 2d, Brignolia, P. Garrett; best 1-yr-old, Director; 2d, Monroe Chief; stallion and 5 colts, Blackbird, D. M. Reavis. Mares—All premiums to D. M. Reavis.

HORSES OF ALL WORK—Stallions—Best 3-yr-old, King of the West, M. C. Sessions; 2d, Black Prince, J. Bidwell. Mares—All premiums to M. C. Sessions.

DRAUGHT HORSES—Stallions—Best 3-yr-old, Webster, D. M. Reavis; 2d, Butler, J. Bidwell; 2-yr-old, Blaine, Chas. Fortier; best span draught horses, Joe and Tuck, J. Bidwell. Mares—1-yr-old, Mollie, J. Crouch.

ROADSTERS—Stallions—Best 3-yr-old, Arthur Wilkes, L. H. McIntosh; 2d, Steinman, D. M. Reavis. Gelding and mares, all premiums to D. M. Reavis.

CARRIAGE HORSES—Best 3-yr-old, 1st, Rosa, N. B. Scott; 2d, Vixen, Mrs. S. A. Jones; best matched span, Bulwer and Andy, D. M. Reavis.

SADDLE HORSES—Louis, F. C. Lusk.

All premiums on colts and sweepstakes on stallion Blackbird and mare Ellen Swiger, D. M. Reavis.

JACKS AND JENNETS—All premiums to J. Crouch, except special, J. V. Flint.

Cattle.

HEREFORD—All premiums to D. M. Reavis.

ALDERNEYS, AYRSHIRES AND JERSEYS—Bulls—3-yr-old, Ben Leonard, Mrs. S. A. Jones. Cows—3-yr-old, 1st, Cricket, T. P. Hendricks; 2d, Diana, and 2-yr-old Jersey, Princess of Sacramento, C. V. Hobart.

DEVONS—Cows—3-yr-old Red Cherry, F. W. Miller.

DURHAMS—Bulls—3-yr-old Bob, J. H. Guill; 2-yr-old Kirk Livingston, and 1-yr-old Forest King, J. Bidwell.

HOLSTEIN—Bull—1-yr-old Joe, J. Bidwell; bull calf, Senator and heifer calf, Red Queen, J. H. Guill.

GRADED CATTLE—All premiums to J. H. Guill, SWEEPSTAKES—D. M. Reavis, bull and 4 cows.

Swine.

THOROUGHBRED—All premiums to B. F. Allen, except 2d Berkshire boar, no name, J. H. Guill and 2d Berkshire sow, no name, M. Schwein.

GRADED—Best hog, M. Schwein.

Poultry.

BUFF COCHINS, Black Spanish, Dominique, C. C. Goree; Brown Leghorn, and Bronze turkeys and turkey, J. H. Guill; Black game, game cock under 1 yr; Red game, Black game, J. H. McIntosh; game bantams, Willie Bay; breeding pen—cock and 4 hens—G. W. Turner.

Grain, Vegetables, Etc.

Bushel wheat, sk flour, cornmeal, sk oats, sugar beets, tomatoes, marrow squashes, Hubbard do, pumpkin, muskmelons, pickle peppers, ½ pk white beans, ½ pk kidney bush beans, ½ pk garden peas, ½ pk Lima beans, J. Bidwell; sk barley, ½ bu. red potatoes, ½ bu. any variety green-flesh muskmelon, ½ pk field peas, coll. plants, J. H. Guill; ½ bu. white potatoes, carrots, sweet corn, Jas. Hegon; ½ bushel sweet potatoes, B. F. Allen.

Fruits.

Twelve var. apples, disp. apples, 6 var. pears, display var. pears, gen. display fruit, var. peanuts, 12 var. grapes, display grapes, dried figs, dried apples, do apricots, do nectarines, J. Bidwell; 6 var. apples,

1 var. almonds, 6 var. apples, seedling peaches, 3 var. seedling fruit, S. L. Skillen; 1 var. pomegranates, 1 var. figs, 2 var. quinces, 5 var. tropical fruits, 1 var. English walnuts, cider and wine vinegars, W. V. Groves; 3 var. pears, dried peaches, fruit in jars (160) B. F. Allen; special display and fruit display, Wm. Bonners; 12 var. orange trees, 12 var. tea plants, 1 var. Spanish sweet pepper, W. L. Bradley; peaches, Mrs. J. A. Watson; black walnuts, Mrs. Salmon; blackberry jam and do jelly, Mrs. J. N. E. Bachelor; currant jelly, preserved fruits and canned fruits, Mrs. N. S. Rose; honey, Mrs. J. F. Entler; dried Hungarian prunes and raisins, M. Schwein.

Miscellaneous.

BUTTER, D. Reid; cage animals, J. A. Hall; display flour and canned fruit, J. Bidwell; cut flowers, W. J. N. Page; bouquets, May Benner.

Oceanside.

A fruit, vegetable and flower show was held at Oceanside, San Diego county, October 27th. The Union says that, although the notice was short and the time rather late in the season, the variety and quality of the exhibits were remarkable. The following awards were made: First prize, best general collection of fruits and vegetables, T. Wackerman; second prize, best display of fruits only, Agua Tibia Ranch, F. H. Cunningham; third prize, third-best general collection, Gould & Rainbow.

Diplomas and honorable mention were accorded to numerous displays of single articles, among which we note bananas, date palms and fruit, and pineapples. It is purposed to have a fair on a larger scale another season.

Measure of Land Values.

The Oroville Register, discoursing of land values, maintains that land is worth just what it will pay a fair interest upon, not a cent more, and the amount it will pay depends upon what the land is adapted to. If the rich, deep, black adobe will produce nothing but grain, then it is not worth over \$50 an acre. If river-bottom land won't grow grain on account of the rank growth of weeds, but will produce \$30 net each year in alfalfa hay, then it is worth \$300 an acre, though it may be no richer soil than the black adobe. If the red gravelly loam of the foothills were planted to alfalfa without water, the product would be represented by a cipher, and the value of the land no higher. If planted to wheat the returns would be so slight that the land would not sell for more than \$10 or \$15 an acre. Set to peaches, plums, prunes or grapes, the returns would send the value of the land vastly higher than the wheat-lands of the valley. Set to the olive, orange or fig, the value would be double the \$300 alfalfa land. Hence it is that production and not richness of soil determines the true value of all land.

HOW BEN BUTLER GOT RICH.

Young Men of To-day May do Likewise if They Follow Advice Given.

General B. F. Butler being asked for some suggestions on gaining success, stated that when he was a young lawyer, practicing in Lowell, Mass., a bank president advised him to take his little deposit and buy real estate, from which he could be deriving some revenue. The General said that he had but little money and was uncertain as to his future.

"Never mind," said the bank president; "go to the next public auction of real estate, bid off a lot with a building of some kind on it, pay down what money you have and give your promissory notes for the balance. You will come out all right."

General Butler says this advice was good. When a man has obligated himself, by his notes, to pay money at a certain time, it inclines him to economy. He followed the advice, and in time became the owner of several parcels of valuable real estate in Lowell.

Two classes will not be likely to heed such advice—the improvident and the over-cautious. The latter will be apt to say: "It would be all right but for those dreadful promissory notes. They are always running on, and if a man falls sick they do not wait for him to get well."

There is this danger, of course, but one can make no business venture without some risk, and with the knowledge acquired by recent investigation of the cause of most ordinary ailments, and the means of cure, one runs little risk from that source. It is now known that most of the common ailments have their origin in deranged kidneys. They are the chief blood purifiers of the system and when disordered a breaking down somewhere is soon inevitable, because the poison, which in their healthy condition is eliminated, is carried through the entire system. Put them in order and health returns.

C. D. Dewey, a successful man, president of the Johnston Harvester Co., Batavia, N. Y., gives his experience as follows:

In 1882 my health was failing, my head pained me constantly, my appetite was uncertain, I could not sleep soundly. I attribute this to the extreme pressure of business cares, but I grew worse, and finally was confined to my bed for two months. It seemed as though I would "never recover" my former health. Under the aid of stimulants I gradually gained strength, so that in a few months I was able to attend to business, but I could walk only with the assistance of a cane, and then in a slow and unsteady manner. I continued somewhat in the same condition until February last, when I used Warner's safe cure. It has cured me. I consider it a valuable remedy and can highly recommend it.

Young men have but to use ordinary prudence, and when any derangement occurs if they use the same means as did this successful business man, they may feel a constant assurance of their ability to carry to successful conclusion all ordinary business projects, including the care of their promissory notes when due.

BACK FILES of the PACIFIC RURAL PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

MARKET STREET,
SAN FRANCISCO.

FRANK BROTHERS,

319 and 321
MARKET STREET,
SAN FRANCISCO.

General Agents for the New Model Gang.

A Plow fully up to the demands of the times, and SURPASSING ANYTHING in the Plow line EVER BROUGHT OUT, in simplicity and neatness of construction, ease of management, lightness of draft, and adaptability to all kinds and conditions of soil.

It is NEW IN DESIGN, neatly and substantially put together, and operated with a single lever, which raises and lowers the Plow and levels it at all depths. The operator walks beside the Plow, on the unplowed land, or behind in the furrow, as preferred, in easy reach and control of both the Plow and the team.

ITS ADVANTAGES are very apparent to every practical farmer; more and better quality of work can be done, a more uniform depth and width of furrow made, with lightness of draft and ease of management under all conditions of soil. Especially when the ground is hard and dry does it show its superiority to the greatest advantage—sticking to its work and turning a 16-inch furrow as deep as may be desired, and with as light, or lighter, draft than any 14-inch hand plow. The harder the ground, the greater difference in its favor.

It is VERY NEAT and substantial in its construction. The beams and wheels are of steel, and all castings of malleable iron, giving at once lightness with great strength and durability.

The shares are so made that they will cut full width until completely worn out. The team is hitched directly to the beams, close to the work, and, having no tongue, it will plow as close to the fence at the end of the furrow as an ordinary Plow, and is turned as easily as a sulky; in fact, it is so easily operated and controlled that a boy can handle it readily.

The McSHERRY GRAIN DRILL,

THE BEST, MOST RELIABLE AND LEADING DRILL.

WITH ITS UNRIVALED FORCE FEED

It sows all kinds of Grain and Grass Seed, Oats and Barley as well as Wheat, and SOWS MORE REGULARLY than any other Drill, whether the grain be large or small-sized. It DOES NOT BUNCH, break or crack the grain.

It CAN BE REGULATED in a moment to sow any desired quantity per acre, with CERTAINTY of getting that quantity in the ground.

It NEVER CHOKES UP in the feeding arrangement, as is the case with Drills regulated by rendering the discharge openings larger or smaller. It sows EQUALLY WELL ON ALL KINDS OF LAND, hilly or level, and it is immaterial whether the horses are driven fast or slow. This Drill must and does sow the same quantity of seed with each revolution of the feed wheels.

It SOWS ALL THE GRAIN OUT OF THE HOPPER, and with the same evenness and regularity when the last grains are going out as when the hopper is full.

It has High Wheels with Wide Tires, giving great bearing surface on the soil, and enabling the Drill to pass over the loosely pulverized earth lightly.

It has Long Hoes of improved style and shape, with strong, wide, and polished steel points, working well in any soil.

AGRICULTURAL IMPLEMENTS,

BUGGIES, CARTS,

HARNESS, Etc., Etc.

SAN FRANCISCO:

J Street.

MANUFACTORY: Benicia Agricultural Works, Benicia, Cal.

EASTERN OFFICE: 88 Wall Street, New York.

IMPORTERS, MANUFACTURERS, AND DEALERS IN

HARDWARE and AGRICULTURAL IMPLEMENTS.

GEM SEED SOWERS.

No. 1, Weight, 130 lbs. \$20.

This Machine is run with a Chain and Bevel Gear. It is the one we have sold for years, and has given the best satisfaction of any broadcast seeder yet invented.

We have manufactured the GEM SEEDERS for a number of years, and they have given better satisfaction than any Broadcast Seeder in the market. They throw the seed horizontally instead of vertically, and thus save a large portion of the grain. Where sold they have never failed to give satisfaction. ARMSTRONG'S PATENT FORCE FEED is attached again this year, and is considered by those who have used it, a great improvement.

THE GENUINE GEM SEEDERS are manufactured exclusively for us at Benicia. SEE THAT OUR NAME IS ON THEM.

No. 2, Weight, 154 lbs. \$22.50.

Runs with Chain and Belt Gear. The advantages gained on the bevel gear are smoothness of movement, noiseless while running, durability of the fast-running parts, and the evenness with which it sows the grain.

No. 3, Weight, 164 lbs. \$25.

Runs with all Gears. This machine is preferred by many to the others which run by Chain. The feed valves and distributor are the same as in the others.

THE LITTLE GIANT SINGLE, DOUBLE, TRIPLE & QUADRUPLE PLOW

Has some points of Superiority over other Plows of its class which should commend it to the intelligent farmer and enterprising dealer.

IT SAVES LABOR.

The shape of the share and the turn of the mold-board are such that the ground is turned with the least possible expenditure of power. No such perfect shaped plow was ever put in the hands of the farmer before. The wheels hold it to its work, thus giving it that quiet, steady draft which does not worry the team, and permits the plowman to do more and better work.

IT SAVES TIME.

It can be adjusted while in motion. If in use on uneven ground, it can be leveled by simply moving the front lever as desired. If plowing on hillside, by the use of the landing lever the cross clevis can be moved so as to bring the plow to its work and cut a full-sized furrow. All these adjustments can be made while the plow is in motion. These are important points, and can be found only on this plow.

IT SAVES MONEY.

Most all the valuable points in a Sulky Plow are combined in this implement, and at a much less cost to the farmer. It is simple, compact and durable. Every part is of steel, and easily duplicated.

The Little Giant Single, Double, Triple and Quadruple Plows have Steel Frames, Steel Beams, Steel Wheels, and the best of hardened Plow Steel Bottoms.

THE LITTLE GIANT QUADRUPLE GANG PLOW, with four 10-inch Bottoms.

**BE SURE AND TRY THE LITTLE GIANT BEFORE YOU BUY,
BECAUSE IT PAYS TO BUY THE BEST!**

SERICULTURE.

Board of Silk Culture.

At the annual meeting of the State Board of Silk Culture, held Saturday, November 5th, the following officers were elected for the ensuing year, viz.: President, G. W. T. Carter; vice-president, W. Z. Price; treasurer, R. H. McDonald, Jr.; sec'y, S. A. Sellers.

The Treasurer's report showed that \$4985.96 had been drawn from the State appropriation of \$5000 for the past fiscal year.

The Filature Committee submitted their annual report as follows:

In January, 1887, the four new reeling machines with automatic batteuse were put in motion and have been working daily ever since. The machines have given great satisfaction, as a better quality of silk can be reeled on these machines, owing to the fact that the automatic batteuse brushes up the ends of the thread from the cocoon in a shorter space of time, and therefore the cocoons are not exposed to the extreme high temperature of water only for a very short time, thereby giving more nerve to the silk fiber.

These machines are so arranged that a competent reeler can reel four skeins of silk simultaneously.

Since January, 1887, 13 pupils have been instructed in the art of silk reeling; of this number, Clelia Hudson, Belle McLoud, Annie Kimball, and Martha Aspdon have been examined as to their proficiency as silk reelers, and were awarded second and third grade certificates, according to the tests made from the silk they reeled at their examination.

There are now five pupils working in the filature. The committee would recommend that more pupils be given instruction in the art of reeling silk, as the reeling machine recently imported and used at the Mechanics' Fair will soon be fitted up and ready to give instructions on.

On recommendation of the Filature Committee samples of the silk reeled in the filature have been sent to several silk manufacturers in New Jersey, Philadelphia and New York, and these manufacturers have written that they were surprised that such a fine quality of raw silk could be raised in the United States. A quantity of raw silk of California production and reeled at the filature of the California State Board of Silk Culture was shipped to the leading silk manufacturers in New Jersey to be manufactured and woven into American flags. It was the object of this board to have these flags woven in time to present them to the houses of the last Legislature, but owing to the strike among the silk-workers the flags were not manufactured and forwarded to this board until the month of July, 1887. A flattering letter accompanied the flags, an abstract from which is as follows: "For the California silk, the material out of which your flags are made, we have this much to say: That nothing better in raw silk exists to our knowledge. In strength, luster and touch it compares favorably with the best products of Europe and Asia. If you have silk of the same quality as that used for the flags to sell, we are open for a contract. As a basis of price we would take that of extra Piedmont and Cevennes."

This letter proves that California can produce as good a quality of raw silk as that raised in European districts where the rearing of worms and reeling of the cocoons has been carried on for many centuries. As the development of the silk industry on the Pacific Coast is only of a few years' growth, and in so short a space of time the silk product has been acknowledged to compare with the best classical raw silk produced in countries where the industry is of many hundred years' growth, what may we expect of the quality of California silk production when it is further advanced and cultivated and the manufacturers become acquainted with its superior qualities? The committee think that the people of the State of California ought to feel proud that among the many States in the Union California can produce raw silk that can stand the test, and it is declared to be equal to any produced in the world. The flags this board had manufactured are very large ones, measuring 12x14 feet, the stripes of red and white silk are 12 inches across, and the white stars in the blue square are sewed in and are nine inches across. A border of three inches of the red material surrounds the whole flag. These flags have been on exhibition at the late Mechanics' Fair held in this city, and were admired by many. This board had quite an interesting display of the silk industry at the Mechanics' Fair held in this city during the month of September, 1887, which attracted much attention. Reeling machines were in operation afternoon and evening, and the pupils of the filature were reeling the cocoons into skeins of raw silk, and practically demonstrating to the many thousands that gathered around the silk booth the method of reeling silk cocoons into marketable raw silk. There were also exhibited samples of cocoons raised in the different counties of California, showing what had been done in Contra Costa, Napa, Fresno, Los Angeles, San Luis Obispo, Sacramento, Amador, Marin, Alameda, San Joaquin, Nevada, Sonoma, Santa Clara, Santa Cruz and other counties; also silkworm eggs, and a case containing specimens of the evolution of the silkworm from the tiny egg to the formation of the silk cocoon. There were

large show-cases containing different shades and specimens of the reeled silk, black-silk stockings, California production of sewing silk and skeins of thrown silk with broad silk of red, white and blue, this being some of the material left from that of which the flags were made. Four thousand pamphlets on general instruction for rearing silkworms were distributed to parties interested in advancing the silk industry on this coast. Exhibits of the silk industry, by request, were forwarded to the Massachusetts Charitable Mechanics' Association, Boston, Mass., and to World's Bazaar to be held at Portland, Oregon, under the auspices of the Young Men's Christian Association. During the months of April, May and June practical demonstration of the method of rearing silkworms was had in the rooms of this board, and information concerning the rearing of the silkworms was disseminated throughout the State. As many as 465 visitors came to see the wonderful workings of and development of the silkworm and the spinning and forming of the cocoon. A good quality of cocoons has been received at the filature of the board this season, showing that the person or families who are rearing silkworms are rearing them with more care and better results, although some of the cocoons received were subjected to too high a temperature when stifling the chrysalis, thereby scorching the silk fiber, making it very difficult to reel the silk, as the thread of the cocoon breaks very often. The Filature Committee has already ordered several qualities of superior silkworm eggs of imported varieties, as, per sample, these eggs will be distributed free to persons wishing to rear them, and having a sufficient quantity of mulberry leaves to feed the silkworms with. Applications for these silkworms will be received from this day, and will be filed in the order received, when the eggs will be distributed at the proper season for rearing them. Respectfully submitted,

LOUISE RIENZI, Ch'n,
R. H. McDONALD, JR.,
G. W. T. CARTER,
Filature Committee.

The board is now well supplied with mulberry trees and cuttings, which will be distributed free (applicants paying their own expressage) to such as purpose engaging in sericulture. The distribution will commence immediately after the rains begin; and those who apply soonest are likely to be soonest served.

Japanese Orange Growing.

EDITORS PRESS:—I have been endeavoring to write you a long letter, but constant traveling has prevented me till now. I have spent the past two months looking up new and old varieties of fruits, etc., suitable for your climate and soil, and have lately returned from a very delightful part of the country, viz., Kishiu (pronounced Keshio), which, with Satsuma province in the Southwest, is where the oranges of Japan grow to perfection. The scenery is not wild, but there are beautiful valleys, and on the slopes of the hills, on terraces cut in the soil, and looking from the distance like steps, grow the "Oonshiu" (pronounced like "oo" in moon, and not like "u" in sun) and other orange trees. They are planted about 10 to 12 feet apart, in fact so close together that frequently the branches intertwine.

They are manured (with liquid) but not irrigated, and are not in large groves, but in small plots owned by farmers of very small means who know no more about cultivating than their grandfathers before them—not making a study of horticulture as we do.

Japanese oranges, as often stated before, mostly grow on large bushes, not over 12 and generally about 10 feet high, but they cover a large space, and I measured one that was 70 feet round. They were full of fruit, and the lower branches, not being strong, were weighted down, lying on the ground and hiding the trunk from sight. The tops are trimmed in the spring to keep them low; and I think that with our soil, which is so much superior to theirs, the advanced cultivation we bestow on our trees, and by pruning away the lower branches which they never touch, we can make a taller tree and give it the shape we prefer. We could, I feel sure, also increase the size of the fruit, which does not often exceed three inches and is flattened at the poles.

By the middle of November or sooner they will be ripe, but already they are picking the green fruit, cutting them in halves and drying in the sun for shipment to China, where the rind is highly esteemed for medicinal purposes.

I have seldom seen anything like the astonishment shown by the country people on looking for the first time in their lives through a microscope. They would not believe the scale to be an insect, but when convinced, they crowded round me, and, in their usual polite way, begged me to "let them see," and delayed me at least two hours, until I had to tear myself away. This scale does not come on any part of the tree except the young shoots and leaves, and on the fruit on which it causes excrescences, which the growers did not know was caused by an insect, and had no idea how to prevent. They know nothing about washing or sprinkling, and I may add I do not think they will ever take the trouble to do it.

The "Oonshiu" is the only seedless orange, but others of the "Mandarin" type (that is, the loose skinned) are also sweet and juicy and worth introducing (especially the *Kino-Kuni* and the *Kawachi*) after the Oonshiu, which every one I ever met in the East, natives as well

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature. Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall.

as foreigners (i. e., English and Americans), without exception, consider the best. I have been 26 years in China and Japan and agree with them.

The close-skinned orange called in China the "Coolie," which grows to perfection in the south of China, is the finest of its kind; but the so-called Canton Hybrid, which was introduced into Japan years and years ago, has deteriorated on account of the inferiority of the climate to China and is not sweet.

The principal advantages of the Japanese sour-orange stock for grafting is its non-susceptibility to cold of 24 degrees or lower, and its standing dry weather well. It is a dwarf stock, however.

I forgot to say that I have sent the photographs I took and samples of the green fruit to the office of the Japanese Tree-Importing Co., 120 Sutter street, S. F.

H. E. AMOORE.

Dues Needed.

Thanksgiving is at hand and we want to be very thankful to all of our subscribers for having renewed and remitted their subscriptions. The long winter evenings are upon us all, and as we are finishing up our evening's work on the paper by writing this item (while the clock strikes ten), we hope every good subscriber who owes us a renewal has just ended a pleasant reading of our last issue, and is saying to his mother or his wife's father (to whom he never dares tell a lie) or to his wife (to whom he never ought to tell a lie) that he is going to remit his subscription to-morrow, and better enjoy the reading of this paper ever afterward.

Christmas, taxes, New Year's and annual settlements are coming right along, and old subscribers and new subscribers are wanted to help us hold up our heads before creditors, and strengthen our hands to do our best work for you in 1888. Please double up things by making yourselves and ourselves happy by early remittances.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

HALL'S SARSAPARILLA

Cures all Diseases originating from a disordered state of the BLOOD or LIVER. Rheumatism, Neuralgia, Boils, Blotches, Pimples, Scrofula, Tumors, Salt Rheum and Mercurial Pains readily yield to its purifying properties. A NEW INDUSTRY FOR FRESNO COUNTY.—There is quite a new industry on the point of being developed in Fresno county. A fine ledge of limestone has recently been uncovered, some 18 feet in width, near Dunlap postoffice, Squaw valley, which promises to be practically inexhaustible. Experts have pronounced it fully equal in every particular to the Santa Cruz deposit. There is also a large body of timber in the immediate vicinity peculiarly suited to the manufacture of barrels for the shipment of lime. Fresno City now receives annually about 8000 barrels of lime for consumption in that vicinity, and the demand is rapidly increasing. By the local production all this product, representing an annual total value of about \$17,000, can be kept at home, and a much larger sum be secured by the supply for the contiguous country. It is confidently expected that the volume of this business will soon reach \$100,000 or more. Possibly San Francisco may in the near future be supplied with lime from this point. —*Modesto Herald.*

Good granite has been found near Raymond, on the Yosemite railroad, and some is being quarried for use in building the steps of the Fresno courthouse.

S. H. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Nov. 16, 1887.

The past week trading in farm products, as a rule, was quite free, with prices generally strengthening. The dry weather contributed no little to the better feeling, but the leading cause, particularly in cereals, is the strong advancing market elsewhere. Throughout the week wheat advanced at the East, and also in Europe. To-day's cable from England is as follows:

LIVERPOOL, Nov. 16.—Wheat, stiff. California spot lots, 6s 6d to 6s 9d; off coast, 3s 9d; just shipped, 3s 4d; nearly due, 3s 6d; cargoes off coast, stronger; on passage, active at full prices and large business doing; wheat on passage to Continent, 19s, 000 qrs.; wheat and flour on passage to U. K., 1,506,000 qrs.; French country markets, stiff; wheat in Paris, firmer; flour, firm; weather in England, frosty.

Foreign Review.

LONDON, Nov. 14.—The *Mark Lane Express*, in its weekly review of the British grain trade, says: There have been larger deliveries of native wheat and increased sales. Quotations are steady. Seedling progresses and the acreage already sown promises an increase in area over 1887. Sales of English wheat during the week were 57,904 quarters at 30s 6d, against 49,771 quarters at 31s during the corresponding period last year. Flour is easy, foreign wheat is dull, and foreign flour is weaker. Corn is steady. The deficiency in the American crop is balanced by ample supplies from the Black Sea and the Argentine Republic. Oats are weak. Linseed has advanced 6d. Six wheat cargoes arrived; three were sold, five were withdrawn and one remains. At to-day's market, although both English and foreign wheat were in small supply, there was no demand. Buyers' offers were low, and sellers would not accept the reduction. Flour and oats are steady. Corn and linseed are firm.

Eastern Grain Markets.

S. S. Floyd & Co.'s private telegraph of the 16th, from their Chicago house, is as follows: Wheat market strong, excited and higher. The local talent think there is only one side to the market and keep selling freely on every bulge. Corn market continues strong and advancing. The "lamb" are catching the old operators in good shape in this cereal. Wheat, Dec., opened, 74½; highest, 75½; lowest, 74½; closed, 75½; May, opened, 80½; highest, 81½; lowest, 80½; closed, 81½. Corn, Dec., opened, 44½; highest, 45½; lowest, 44½; closed, 45½; May, opened, 48½; highest, 49½; lowest, 48½; closed, 49½.

NEW YORK, Nov. 16—12 M.—Wheat, 87½¢ for cash, 85½¢ for Nov., 86½¢ for Dec., 87½¢ for Jan., 88½¢ for Feb., and 92½¢ for May.

California Fruit at the East.

CHICAGO, Nov. 12.—Receipts of California fruit are dropping off, as it is near the end of the season. There is some good fruit on the market, for which pretty good prices are to be had. The market is steady, with no noticeable change in prices. The following are ruling prices for fruit in condition: Pears, \$1.75@2.75 per box; Tokay grapes in double crates, \$3.75@4; Muscat grapes, \$2.75@3.25; quinces, \$1.50@1.75; late red plums, \$1.75@2.20.

Dried Fruits.

CHICAGO, Nov. 12.—The California dried fruit trade in raisins continues good, but for other lines the market is quiet and slow. All descriptions hold steadily at former quotations. Peaches, sun-dried in sacks per lb. 12½@13½¢; do, evaporated, unpeeled, in sacks, per lb. 15½@16½¢; do, do peeled, in sacks, per lb. 25½@27½¢; apricots, sun-dried in sacks, per lb. 13½¢; do, evaporated, in sacks, per lb. 15½@17¢; plums, pitted in sacks, per lb. 13@14¢; nectarines, according to quality, sacks, per lb. 14½@16¢; raisins, loose Muscats, per box, \$1.85@1.95; do, London layers, \$2.20.

Hops.

CHICAGO, Nov. 12.—For lower grades of hops the market is ruling weak and prices are somewhat easier. They are in fair supply and in but limited request. Choice qualities, however, continue steady. For these there is a good export trade, larger than has been looked for, and the home consumptive demand for choice qualities is also very fair. Quotations are: Pacific choice new crop, 20¢@22¢; do, do, medium, 16¢@20¢.

Eastern Wool Markets.

NEW YORK, Nov. 12.—A majority of operators retain about the former views of the situation, and there is really very little to suggest at the moment. Among the sales were: 25,000 lbs. Eastern Oregon at 20¢@24¢; 50,000 lbs. Territory at 18¢@23¢; 32,000 lbs. do, at 20¢; 40,000 lbs. spring California at 22¢; 9,000 lbs. scoured and 4,000 lbs. Territory on private terms.

PHILADELPHIA, Nov. 12.—The market has continued very quiet. Buyers are operating only for actual wants and show no disposition to anticipate requirements, although on desirable wool there is a growing feeling that no further decline is to be expected. Among sales were 10,000 lbs. fine Territory at 14¢; 100,000 lbs. Territory, fine, medium and coarse, at 16¢@22¢; 16,000 lbs. Montana medium at 21½¢.

BOSTON, Nov. 12.—The market has developed a little better tone, owing to the presence of an increased number of buyers, and sales foot up more than last week, but no improvement in prices can be reported. Among sales were 604,000 lbs. Territory at 15¢@23¢; 100,000 lbs. Oregon at 16¢@17¢; 139,000 lbs. California spring at 14¢; 18,000 lbs. California fall at 12½¢.

Mustard Seed.

NEW YORK, Nov. 12.—Mustard seed is in demand, with sales of 300 bags of California at 4½¢.

Miscellaneous.

CHICAGO, Nov. 12.—California beans, according to cleanliness, \$1.50@2.75.
California strained honey, 7¢@8¢.
NEW YORK, Nov. 12.—The market continues

active. California consignors are endeavoring to establish a 10-cent market for strained; Pacifics sell in a moderate way for 14¢@17¢, as to quality.

Local Markets.

BAGS—Futures are steady, at from 7 to 7½¢ for Calcutta June-July delivery.

BARLEY—On Call there have been free transactions, at strengthening prices. The upward movement is due to stocks being better concentrated, dry weather and the crops at the West being light, with the grades not as good as last year. At to-day's Call the sales reported made were as follows:

Morning Session: Buyer season—100 tons, 96¢; 400, 96½¢; 2200, 96½¢. Seller 1887—100 tons, 85¢ @ ctd. Afternoon Session: Buyer season—600 tons, 96¢; 1300, 95½¢; 600, 95¢; 600, 95½¢. Buyer 1887—100 tons, 86½¢ @ ctd.

BUTTER—The market is poorly stocked with pickled. The stock on Nov. 12 was about 1400 barrels, against about 4500 barrels last year at like date. Choice fresh butter is also scarce and readily commands from 42½ to 45¢.

CHEESE—The market is strong, but quiet.

EGGS—The market is weak and lower, under more liberal supplies from the East. Consumers buy sparingly under the impression that prices will go still lower.

FLOUR—The market has a steadier, stronger tone.

WHEAT—There has been more activity the past week in futures on Call, and at gradual advancing prices in sympathy with a higher range of values abroad and also at the East. It is claimed that there is quite a line of shorts on the market, but of this no definite information can be obtained. It looks as if the trading has been of scalping character, and if so there are no shorts of any moment. On to-day's Call, the sales made were as follows:

Morning Session: Buyer season—1000 tons, \$1.47; 1400, \$1.46½; 200, \$1.47½; 700, \$1.46½; 500, \$1.46½. December—100 tons, \$1.33½; 100, \$1.34. Buyer 1887—100 tons, \$1.36½; 100, \$1.36½ @ ctd. Afternoon Session: Buyer season—1000 tons, \$1.47½; 2500, \$1.47½; 700, \$1.47. December—200 tons, \$1.34½. Buyer 1887—400 tons, \$1.36½ @ ctd.

[COMMUNICATED.]

Market Information.

Cereals.

Quantity of wheat on passage to France, Oct. 28, reported at 400,000 bushels, against 1,780,000 bushels same date last year.

Exports of wheat from St. Petersburg from opening of navigation to October 15, 1887, 2,625,792 bushels, against 7,915,696 bushels the corresponding time in 1885, and 9,838,396 bushels the corresponding period in 1885.

Stocks of wheat at Odessa, October 1, were 6,024,000 bushels, against 3,330,000 bushels Oct. 1, 1886. The stock of other cereals there is small. The Azov sea may be expected to close early.

Exports from Russia for seven months ended July 31, as officially reported, have been 24,621,120 bushels of wheat; 25,520,000 bushels of rye; 17,936,000 bushels of barley; 13,920,000 bushels of oats; 13,024,000 bushels Indian corn, and 1,056,000 bushels peas.

The average price of home (British) wheat for the week ending October 29 was 30s. per 480 pounds, against 29s. 9d. the previous week, and 30s. 3d. the corresponding week a year ago, and 31s. 4d. two years ago. The aggregate supply for the nine weeks ending October 29, 1887, was 39,014,999 bushels, equal to a weekly average of 4,334,999 bushels or 334,999 bushels more per week than the average estimated weekly consumption, which in nine weeks would approximately give 3,014,991 bushels to add to the reserves.

Referring to the large deliveries by farmers, the Minneapolis *Market Report* says: "From a completed investigation of the wheat movement in the Northwest it is found that approximately 46 per cent of the marketable crop of this year has already gone from the farm to the railroad elevators. The estimates were obtained from every railroad station in Minnesota and Dakota that ships wheat to any extent, and was figured for November 1. The method followed has been to get the estimate from each station separately for the movement in that vicinity and average the whole. The different elevator companies operating lines of houses were called upon for such information as they were able to furnish in making the estimates as complete as possible. Three of the wheat-carrying roads were asked for their estimates of the per cent out of the hands of farmers. The result was that 42 per cent of the crop, above bread and seed, had then left the farm. To bring the estimate down to date, 4 per cent has been added for the seven days in November, making it now approximately 46 per cent of the whole, moved in the first two months of the crop year. The estimates on the wheat taken to railroad stations, and now in store to the account of farmers, is about 10 per cent, or 90 per cent of the whole moved has been sold, which would still leave farmers the owners of 58 per cent of the marketable crop."

A private circular issued at Chicago says: "At Minneapolis receipts of wheat have been unprecedented, though the elevators do not fill up appreciably, as the great bulk of receipts have been seized upon by millers for grinding. This is not only true of the local millers but obtains also in the country, from which section the demand for grinding has been more than ordinarily heavy."

In this city the market for actual wheat is exceedingly strong, with as high as \$1.32½ paid for standard No. 1 white favorably situated. The urgency of the demand appears to be for stiffening and also topping off. Stiffening is wheat say from 100 to 200 tons put in the vessel when empty, to keep her steady and not roll over. Topping off is say from 50 to 150 tons to put in the vessel after she is loaded and in the bay. The wheat for such purposes must be afloat so it can be delivered alongside of the vessel. Sales of No. 1 wheat can readily be made at \$1.30@1.31½, but holders are not disposed to let go at present, but ask much more money. The dry weather also favorably affects the market. At the East the market has been steadily advancing, as it has abroad.

Oregon mail advices to Nov. 12 report as follows: Wheat receipts for the week were 11,650 tons, of which all but 774 were Eastern Oregon. This is

296 tons better than last week, and 2206 tons more than the corresponding week of last year. The light Valley movement is partly owing to the fact that millers are paying a little better than shippers can afford. Local quotations for shipments remain as last week, \$1.25 being the extreme obtainable for choice Valley, and \$1.10 for Eastern Oregon.

Eastern mail advices report a gradual advancing market for choice grades of barley, under liberal buying and a lighter supply than for several years past. The crop at the West this year was below an average, with the quality generally poor. In the local market there is an increasing speculative movement, due to the large consumption, strong holding and continued dry weather. At the close there is a better inquiry for the better grades, both feed and brewing.

Oats have continued strong throughout the week. Holders are not pressing their stock on the market, which counteracts buyers only purchasing for immediate wants. Receipts are only moderate. Oregon advices report a larger consumption there than obtained last year.

Corn ruled fairly strong the past week for the better grades, which are in slight supply, but ordinary grades being in liberal supply are difficult to place except at concessions. At the close the market was stronger, owing to an advancing market at the West.

In both rye and buckwheat the movements are slow, but as the offerings are light the market has a firm tone.

Dried Fruits.

The most noticeable fact in dried fruit is the gradual hardening tone in peeled peaches, which, it is rumored, have been concentrated. The supplies are very light. They are principally in the hands of one large house that has taken up a dozen lots which have been kicking around the market, and prices have assumed a firmer tone. Dried apricots are in light supply.

Raisins.

Telegraphic advices from New York, just at hand, show a weaker Malaga market. Offerings of loose Muscats in the local market are quite free. There is a great scarcity in the market for London Layers, which are bringing high prices for the local trade. Demand from the Eastern States for London Layers remains very spirited, and the lower prices for loose Muscats have not affected the market value of London Layers.

Feedstuff.

The consumption of bran, middlings and ground barley continues very large, owing to poor pasturage, more milk cows coming in, and also the fattening of cattle for market. The market for ground feed is steady, with a firm tone.

Hay continues to come in sparingly, particularly the better grades. The consumption is large, with the supplies in the interior to draw from quite light. It is very generally conceded that if we should have a hard winter commencing with next month, prices will be advanced to much higher figures.

Vegetables.

Onions have fluctuated some the past week, closing fairly strong, under a good demand for choice and only moderate receipts.

Potatoes, the past week, ruled quite steady. Heavy receipts and good stocks caused a weak tone. The consumption is quite large.

Cabbages are strong, with a good demand ruling for both home and shipping. Tomatoes are a drug, with sales made extremely low. The low prices ruling for canned tomatoes have caused canners to cease packing.

In other summer vegetables the market shows few changes.

Fruits.

Choice apples are in better request to meet the holiday demand. The call is both locally and shipping. Fair to ordinary are also firm. Defective apples are hard to place.

Choice pears are wanted at an advance, causing other qualities to rule firmer.

Quinces are firm, with a strong tone at the close. Table grapes have a stronger tone for the more choice sound and good keepers. Poor and ordinary are slow. Wine grapes are doing better, with a better demand ruling for both Mission and Zinfandel.

Strawberries are in good supply, but keep strong.

Live-Stock.

The market for choice bullocks is stiff, but they must be stall-fed. Choice grass-fed are in lighter supply, but as they are received chiefly from distant points by rail, good prices have to be obtained to net a profit. Ordinary cattle are easy under liberal offers. Mutton sheep are in good supply, but choice, not too fat, are readily placed at top quotations. Veal and small calves are in fair supply. Hogs are offering quite freely, but sellers are not disposed to accept lower prices. Packers are running to full capacity, that is, putting up all the meats they can. In horses, last week's report covers this week's market.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7½¢@7¾¢; first grade, grass fed, 6½¢@6¾¢; second grade, 5½¢@6¼¢; third grade, 5¢@5½¢.

MUTTON—Ewes, 5½¢@6¢; wethers, 6¢@6½¢.

LAMB—Spring, 7¢@8¢.

VEAL—Large, 6¢@7¢; small, 6¢@8¢.

PORK—Live hogs, 4½¢@4¾¢ for heavy and medium; hard dressed, 6½¢@7¼¢ per lb; light, 4¢@4¾¢; dressed, 6¢@7¼¢; soft hogs, live, 3½¢@4¢. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	331,301	252,780
In port, disengaged.....	85,000	73,000
In port, engaged.....	30,331	66,018
Totals.....	446,632	420,798

To get the carrying capacity, add 60 per cent to the registered tonnage as given above.

Beans are very stiff, under moderate receipts and a good demand from the East. Choice grades are scarce.

In poultry, turkeys are steady, with a strong tone as Thanksgiving approaches. In hens, roosters,

broilers, geese and ducks, the market has ruled steady and strong.

Flaxseed is strong, in sympathy with a strong market at the East.

Wool rules firm for the choice grades, in sympathy with a strong market at the East.

Choice hops are in request, but ordinary grades are slow. The stocks carried by brewers are reported to be light.

San Francisco, Nov. 16, 1887.

Domestic Produce

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING NOVEMBER 8, 1887.

372,652.—SECTIONAL HORSESHOE—E. W. Bingham, Portland, Ogn.

372,956.—EXCAVATOR—A. B. Bowers, S. F.

372,893.—CAR-COUPLING—Samuel Byrne, Brown's Valley, Cal.

372,842.—BALING PRESS—W. F. Denlis, Cottonwood, Cal.

372,789.—SAFETY-LOCK FOR GAS BURNERS—Drinkhouse & Ziesche, S. F.

372,922.—AUTOMATIC STEM-PESSARY—Alice O. McCord, Colfax, W. T.

373,026.—CONCENTRATOR—F. E. Monteverde, S. F.

372,707.—EMBROIDERY FRAME—John Sanders, S. F.

372,708.—LUBRICATOR—J. C. Schellenbaum, Portland, Ogn.

372,825.—LINIMENT—J. W. Still, S. F.

372,946.—HEATING PIPE CONNECTION BETWEEN CARS—W. L. Harlingen, Sr. & Jr., S. F.

372,947.—HEATING PIPE CONNECTION BETWEEN CARS—W. L. Harlingen, Sr. & Jr., S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARED C. HOAG—California.
G. W. INGLIS—Arizona.
Geo. McDowell—Santa Clara Co.
WILLIAM POOL—Fresno Co.
R. G. HUSTON—Butte, Montana.
E. P. SMITH—Washington Ter.
A. F. JEWETT—Tulare Co.
F. B. LOGAN—San Mateo Co.
E. H. SCHAEFFLE—Calaveras Co.

RANCHO CHICO NURSERY.—We have received a copy of the catalogue for 1887-8 of the Rancho Chico Nursery, owned by Gen. John Bidwell. Gen. Bidwell, as is generally known, has been growing trees in orchard and nursery for over 36 years. The past year, owing to demand for his trees, the nursery department of Rancho Chico has been increased over one-half. The catalogue shows a full assortment of tested varieties of fruits, shade trees and shrubs in large variety and a fine collection of roses.

Jackson Centrifugal Pumps.

JACKSON

Automatic Expansion SELF-OILING ENGINES.

Made in ten sizes, from two to sixty-horse power, and carried in stock for prompt delivery

"ECONOMY" PORTABLE BOILERS.

MOUNTED ON SKIDS. 2½ to 20 H. P.

BYRON JACKSON,

625 Sixth St., San Francisco, Cal.

For quantities of water not less than 100 gallons per minute, and for lifts not exceeding 100 feet, there is no better pump than that illustrated in the annexed engraving. It is very simple, durable, and economical. I make them in sizes from 2-inch, 100 gallons per minute, to 24-inch, with a capacity of 14,000 gallons per minute, and am prepared to build larger sizes to order. They must be set within 20 feet of the water; will draw it that far and force it up 90 feet. They are very satisfactory in wells not over 100 feet deep.

COMPLETE Power and Pumping PLANTS

A SPECIALTY.

BYRON JACKSON, 625 SIXTH ST. San Francisco, Cal.

A. T. DEWEY. } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED
W. B. EWER. } 1860
GEO. H. STRONG. }

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

EVERY FARMER HIS OWN MILLER

THE BEST is the CHEAPEST

WE HAVE HAD 32 years Experience. Use the Halladay Standard Geared Wind Mill, I-X-L Corn Sheller and I-X-L Iron Feed Mill and do your shelling and grinding at home, thus saving toll and teaming to and from the Grist Mill. This work can be done rainy, windy days, when out-door work is suspended on the Farm. The same Mill will cut corn stalks, saw wood, run a churn and grind stone, pump water, etc.

We manufacture the Halladay Standard Geared and Pumping Wind Mills, I-X-L Corn Shellers, I-X-L Iron Feed Mills, I-X-L Stalk Cutters, Horse Powers, Jacks, Saw Tables, Standard Haying Tools, consisting of Anti-Friction, Reversible, Swivel and Rod Hay Carriers, Harpoon and Grapple Horse Hay Forks, Pulleys and Floor Hooks. Also a full line of Tanks, Tank Fixtures and Pumps for Farm, Ornamental, Village and Railway purposes. Send for catalogue and prices. Reliable Agents wanted in all unassigned territory. U. S. WIND ENGINE & PUMP CO., Batavia, Ill.

Fruit Engravings, The finest, best and cheap
PHOTOGRAPHS, ETC. est Photographs and En-
gravings of Fruits, Vegetables, Houses, Farms, Landscapes, etc., made by S. F. PHOTOGRAPHING CO., 659 Clay St., S. F.

ORANGES!

The "Cyclone" Windmill, say a 20 or 24-foot wheel, will raise enough water to irrigate from 20 to 100 acres of Orange Trees.

This is CHEAPER than BUYING WATER from a Ditch Company.

ARCTIC COLD.—A person who has never been in the polar regions can probably have no idea of what cold really is; but by reading the terrible experiences of arctic travelers in that icy region, some notion can be formed of the extreme cold that prevails there. When we have the temperature down to zero out of doors, we think it bitterly cold; and if our houses were not so warm as at least 60 degrees above zero, we should begin to talk of freezing to death. Think, then, of living where the thermometer goes down to 35 degrees below zero in the house in spite of the stove. Of course in such a case the fur garments are piled on until a man looks like a great bundle of skins. Dr. Moss of the English polar expedition of 1875 and 1876, among other odd things, tells of the effect of cold on a wax candle which burned there. The temperature was 35 degrees below zero, and the doctor must have been considerably discouraged when, upon looking at his candle, he discovered that the flame had all it could do to keep warm. It was so cold that the flame could not melt all the wax of the candle, but was forced to eat its way down the candle, leaving a sort of skeleton of the candle standing. There was heat enough, however, to melt oddly shaped holes in the thin walls of wax, and the result was a beautiful lace-like cylinder of white, with a tongue of yellow flame burning inside of it and sending out into the darkness many streaks of light. This is not only a curious effect of extreme cold, but it shows how difficult it must be to find anything like warmth in a place where even fire itself almost gets cold. The wonder is, that any man can have the courage to willingly return to such a bitter region after having once got safely away from it, and yet the truth is, that the spirit of adventure is so strong in some men that it is the very hardship and danger which attract them.

Over-Worked Women.
For "worn-out," "run-down," debilitated school teachers, milliners, seamstresses, housekeepers and over-worked women generally, Dr. Pierce's Favorite Prescription is the best of all restorative tonics. It is not a "cure-all," but admirably fulfills a singleness of purpose, being a most potent specific for all those Chronic Weaknesses and Diseases peculiar to women. It is a powerful, general as well as uterine, tonic and nerve, and imparts vigor and strength to the whole system. It promptly cures weakness of stomach, indigestion, bloating, weak back, nervous prostration, debility and sleeplessness, in either sex. Favorite Prescription is sold by druggists under our positive guarantee. See wrapper around bottle. Price \$1.00 a bottle, or six bottles for \$5.00.
A large treatise on Diseases of Women, profusely illustrated with colored plates and numerous wood-cuts, sent for ten cents in stamps.
Address, WORLD'S DISPENSARY MEDICAL ASSOCIATION, 663 Main Street, Buffalo, N. Y.

Dr. Pierce's "Favorite Prescription" is not extolled as a "cure-all," but admirably fulfills a singleness of purpose, being a most potent specific in those chronic weaknesses peculiar to women.

No trouble to swallow Dr. Pierce's Pellets.
USEFUL PLANTS AND ANIMALS.—Dr. Hock, a German naturalist, finds that the Eastern hemisphere affords 269 species of plants and 58 of animals useful to man, while the Western world contributes only 52 of plants and 13 of animals.

Farmers and Viticulturists, Attention!
FERTILIZE! FERTILIZE!
NITROGENOUS SUPERPHOSPHATE.
UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.
Dr. J. KOEBIG—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:
Soluble Phosphoric Acid.....12.90 per cent
Reverted Phosphoric Acid......95 "
Insoluble Phosphoric Acid......2.83 "
Potash......2.23 "
Ammonia......1.87 "
Nitric Acid......2.95 "
The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.
This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally in California. Yours truly,
DR. E. A. SCHNEIDER.
University of California, College of Agriculture.
BERKELEY, Nov. 20, 1886.
Dr. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.
The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.
In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.
FOR SALE IN LOTS TO SUIT,

NITROGENOUS SUPERPHOSPHATES

—OF THE—

MEXICAN PHOSPHATE & SULPHUR CO.,

The Best Fertilizer in the World!

IN USE IN ALL PARTS OF THE OLD WORLD AND ACKNOWLEDGED TO BE
 THE BEST KNOWN.

We have been shipping this material for years to our Agents, Messrs. SCHRODER & MICHAELSON, HAMBURG, and under date of January 4, 1887, they wrote:

"The demand for your phosphates continues very good, as you will see from our having sold so far ahead as September and October arrival, at full prices, and we could to-day place a much larger quantity if we only had them to offer."

Under date of January 26, 1887, Messrs. SCHRODER & MICHAELSON, alluding to letters acknowledged, write as follows to H. M. NEWHALL & CO.:

"They referred partly to the quantity of Mexican Guano which we may expect to receive in the course of the present year, in regard to which our repeated inquiries addressed to the Company had so far brought no reply. We are glad to note from your telegram that Mr. Halsey has now written us on the subject, but we are, on the other hand, somewhat disappointed at the SMALLNESS of the figure you name (8000 to 10,000 tons) which we hope is exclusive of the 'Tranmere' and 'Saigon' cargoes. We have, in fact, in consequence of the numerous inquiries for this guano, been placed in an awkward position, through not being able to give any reliable information to our buyers in regard to the quantity of Mexican Guano forthcoming during the present year."

Its Introduction into California has been marked with the most gratifying results.

IT IS THE CHEAPEST, BECAUSE THE MOST EFFICACIOUS! THE SAFEST, BECAUSE DIVESTED OF ALL ORGANIC MATTER!
 AND IS TOTALLY INOFFENSIVE TO TOUCH OR SMELL!

We invite correspondence with Farmers, Viticulturists and others interested, and are prepared to give the minutest details in regard to this most valuable Fertilizer. For particulars of Analysis see certificate of Dr. Schneider and testimonial of Professor Hilgard in another column.

A Rodent Roundup.

In the matter of dealing with the devouring jackrabbits, last week witnessed a new departure.

On the plains of Tulare county, near the town of Pixley, a V-shaped fence had been built with a corral at the apex. Monday morning, November 14th, several hundred people, mostly farmers and their families, assembled to engage in the rabbit-drive. No fire-arms nor dogs were permitted in this hunt; but men, women and children, in vehicles and on horseback, marshaled by J. R. Priest, with Mr. Doran and M. F. Pixley as his aids, formed a semi-circular procession about three miles in length, and then began closing in toward the opening of the V.

As the line of drivers neared the outer ends of the fence, it became apparent that they were herding the hares not by hundreds but by thousands, and those who saw the bounding drove of *leporas*, as it swept over the stubble and short alfalfa where there was no dust, say it was indeed a memorable sight. Great excitement prevailed, and as a rabbit would now and then turn about, bolt through the ranks of yelling enemies and gallop off upon the plain, the wisdom of having barred out guns and pistols began to be evident. As the terrified animals ran down the inside of the fence on the south side, they encountered a little inclosure made for a garden. This obstacle occasioned a stampede. "Away went hundreds of them back through the cordon of drivers, and though many were killed, it is estimated that 500 or 600 escaped. The main body, however, ran around the projecting fence and kept on down the side of the V to the corral at the apex."

When the doomed creatures had been forced into the corral and the gate closed, the hunters entered with clubs and about 2000 of the pests were knocked in the head. Enough rabbits were taken alive for shipment, however, to pay all expenses incurred.

The drive was so successful that the managers are already planning another, and such organized campaigns may become quite popular in the most afflicted sections. While they would not wholly exterminate the mischievous gnawers, they might be made the means of thinning them prodigiously; and as one of the

Visalia papers remarks, "two miles of portable fence for wings and a few rods for corrals would be all that is required; the cost would be slight when divided among those who would be directly benefited; and it could be sold when no longer needed for at least half what it cost."

SUIT OVER A FRUIT DRIER.—Our fruit interest bids fair to furnish its share of business for

HOP AS A FIBER-PLANT.—A Sacramento gentleman, said to be perfectly conversant with fiber-plants, is the *Record-Union's* authority for stating that hopvines, which have been considered of no value, are worth far more for textile fabrics than the jute imported from India. He claims that burlaps made from hopvines would be of great strength and durability, and for grain-bags would almost be indestructi-

The Newcastle Apricot.

We give herewith a dish of the Newcastle apricot, a California seedling which originated in the orchard of C. M. Silva & Son of Newcastle, Placer county. It was first noticed in 1881 on account of its combining extra earliness with size and quality, which do not exist in our extra early varieties now. In their catalogue of 1883-4, Silva & Son speak of this variety as follows: "We believe it to be the earliest of all apricots; ripens here with Wood's Early, and is every way superior in size and quality; size, full medium, round; rich, golden yellow, with brilliant red cheek in the sun; freestone; flavor, sweet and rich; tree a heavy bearer and healthy; has fruited with us three seasons, and this past season we had fruit on fully 20 trees in the nursery." No trees were then offered for sale, but the originators have kept the variety under trial until the present year, when fully convinced of its value, they offer it to the public. They assure us that since their first announcement of it four years ago, it has fruited regularly every season and has fully sustained their original judgment of it. The tree has proved a regular and good bearer and very vigorous—more so than any of the large

THE NEWCASTLE APRICOT—A CALIFORNIA SEEDLING.

the lawyers. We have in mind a number of suits which have arisen under contracts by different parties in the fruit interest. The latest is in the form of a suit for damages by D. O. Vestal of San Jose against Fink & Evarts, proprietors of the Pneumatic Drier. The contract was that the drier should be set up and do satisfactory work before August 1st, the test to be made before any money was to be paid by Mr. Vestal.

Mr. Vestal now alleges that the test was made, preparatory to which he expended \$800 in construction and fitting up the machine; that defendants were present, and that the drier proved an utter and complete failure, and not only would not dry fruit in quality and quantity, as provided in said contract, but also that it burnt, destroyed, and ruined the fruit; that having 30 acres of orchard, wholly dependent upon said drier, the breach of contract has resulted to his damage in the sum of \$10,000. Judgment for that sum and costs is asked. We do not hear what answer is made to Mr. Vestal's claim.

The hopyards of Sacramento county alone can furnish material enough to supply the entire demand of the State for grain-bags, and as each acre will turn off at least three tons, which could be readily sold, say at half a cent per pound, it would be a source of profit to the grower, while at present it costs considerable to get rid of them.

NAPA WINES.—A gentleman from St. Helena was speaking to us on Tuesday with regard to the wine interests of Napa county this season. The combination on the part of city wine merchants last year had so injurious an effect in lowering the price of wine that the makers generally were very cautious this season as to buying and beginning to press. So the grapes hung upon the vines too long, and the extremely hot weather, which came just as they were ripe, caused them to sugar excessively; consequently, instead of making 150 or 160 gallons per ton, they yielded but 110 or 120, which of itself would make the crop short. The wine is now through in good shape.

number of varieties which they have in their collection. This year it ripened before the Pringle in the same orchard. It ships well, and has been sent this year to Chicago and other distant points in good condition. In quantity it has shown itself to be better than other varieties, and seems likely to prove a popular sort both for home use and market.

We saw the Newcastle apricot for the first time on June 1st of the present year, when a box of ripe fruit was sent us by the growers. The engraving is made from a photograph of a dish of the fruit from that box. What especially impressed us in the fruit, aside from its size and color, was its exquisite richness of flavor. We are always glad to bring to notice a promising California seedling fruit, and the Newcastle certainly belongs to that class. We hope it will be widely distributed this year, so that its behavior in all regions may be soon made known.

MOST of the Humboldt county sawmills have logs enough to run them all winter.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Through San Mateo County.

EDITORS PRESS:—On the morning of the 11th instant we found ourselves, with horse hitched to a light buggy, starting out for a jaunt through San Mateo county. A dense fog hung over San Francisco, and a chill pervaded the air. To one but little acquainted with our peculiar climate, a heavy rain seemed imminent, but we gave ourselves no uneasiness on that score, as we know that "all signs fail in dry time," especially in California. Following the Mission-street road for two hours of gentle driving amid an undulating landscape diversified with gardens and orchards, whose verdure contrasted vividly with the brown hills that lay to right and left, we reached the imaginary line that divides San Francisco county from her sister, San Mateo. The fog had by this time vanished and the sun shone forth if not with tropical splendor, at least in happy contrast with the gloomy appearance of the horizon that had preceded. A short distance beyond, we ascended a slight eminence and a magnificent view burst upon our vision. Prior to this time our mind had been engaged contemplating the quiet scenes incident to the rural and suburban homes we passed, little thinking that just at our feet, so to speak, rolled the foaming billows of the grand Pacific ocean. We halted for a moment to gaze, then drove on. Our thoughts turned to the great discoverer of these waters, and we saw there was some excuse for the seemingly inordinate pride he felt, and the cruel sacrifices he made to behold it for the first time in the history of our race.

A few miles further on we reached Colma, formerly called School-house Station, and still known to most people by the latter name. It is a mere village of perhaps 100 inhabitants, but important as containing some public-spirited men, among whom we heard mentioned R. S. Thornton, the first settler of the place. We were particularly indebted to Mr. Andrew Passalacqua, manager of the general store of M. Belli & Co., for information and other favors.

A mile and a half further south we halted at the public house of Mr. O. McMahon, a resident since 1852, from whom we gained a number of ideas regarding the country and its early history. This place is also a railway station, and directly opposite, looking north, lies Holy Cross Cemetery, comprising over 200 acres, established this year and now being beautified, about 25 men being constantly employed in making improvements. It is the intention ultimately to run daily trains especially for funeral accommodations. Ten burials a day were noted in the past week, which makes it seem probable that the space set apart for the purpose will be occupied before the lapse of the present century. Mr. Brady, the contractor for the \$410,000 courthouse at Los Angeles, is about to establish marble works in this locality in behalf of his sons. A good quality of blue granite is said to exist here, from which the Starr King church in San Francisco is to be constructed. The rock took a premium at the last Mechanics' Fair.

The principal industry of the people hereabout is gardening and dairying, for which, on account of its close proximity to San Francisco, the district appears specially adapted. But aside from the local market, the gardening business does not seem to be dependent upon San Francisco or any other market of this coast. Last year about 40 carloads of cabbages alone were shipped to Omaha and Kansas City, while this year the crop is represented as greater than ever before.

We spent the night with Robert Ashburner, Baden, who, as most readers of the RURAL PRESS are well aware, is engaged in the breeding and rearing of fine stock. His present herd of cattle consists of about 200 head, many being exceptionally fine specimens of the Short-horn family. Here we had an opportunity of sampling milk from this stock, and candor compels us to say that either we had not tasted any genuine milk for a year or two, or else our condition for making the test has been out of order during the time. There may not be so much difference in the quality of the lacteal fluid that flows from the udder of a Short-horn and that which is extracted from common stock as we are led to believe, yet we are convinced that the percentage in favor of the former is considerable and quite justifies an exchange of the latter for the former, even at considerable cost. Mr. Ashburner also keeps some good horses.

After taking leave of our host and his excellent wife, whom we shall gratefully remember for their hospitable courtesies, we again started southward.

A more inviting retreat can hardly be imagined than Milbrae, the country-seat of D. O. Mills, the millionaire banker. What nature has omitted to make the place attractive has been lavishly supplied by art. The environments are picturesque, the sparkling waters of San Francisco bay lying on one side, and slopes sparsely wooded with live-oak and other timber on the other, and lanes stretching out in all directions lined with various evergreens and shade trees.

Four miles further brings us to San Mateo, where we intend remaining over Sunday. Of this place we may have something to say in our next.

T. B. L.

Notes from Contra Costa County.

EDITORS PRESS:—Perhaps there is no other county in the central portion of the State so little understood by the outside world as Contra Costa. Encircled as it is on all sides by railroads, nevertheless the interior of the great county of Contra Costa is a veritable *terra incognita* to a large majority of the people of California.

During the past month I made a 20-days' canvass in the interests of the RURAL among the mountain fastnesses of this part of the State, and every day's journey brought new surprises and pleasing disappointments at the vast amount of level land and the wonderful fertility of this remarkable hill region.

Instead of a barren, mountainous tract, as Contra Costa appears from the border, her territory consists of an almost unbroken chain of beautiful valleys, penetrating the county in every direction, and amounting in the aggregate to a great many thousand acres of the very richest grain and fruit land in the State, while the hills are also well suited to the cultivation of the grape and other fruits.

Among these valleys San Ramon is the most extensive, running completely through the county from Martinez on the north to Livermore on the south. For rich soil, thorough cultivation and fine farm buildings this beautiful valley compares very favorably with any agricultural section on the coast.

Among the more prominent ranches in this section may be mentioned those of August Hemme, Cook's, or the "Railroad Ranch," Capt. Harrison's, Glass, several of the Stone family, and many others, on all of which the barns, dwelling-houses and other farming appurtenances are of the very highest order, either for stock or grain-raising.

The yield of grain is frequently immense, and the herds of fine horses and cattle to be seen in this valley are well worth the cost of the trip. We stopped one night at the pleasant home of Mrs. M. J. Harlan, near San Ramon village. She is quite extensively engaged in stock-raising, and from all appearances is making it pay. On the ranch of E. P. Smith of Alamo we were shown a barley-field from which Mr. S. harvested 100 bushels of barley per acre, and this is not an uncommon yield on this land, either.

Ignacio valley is another fine tract of level land, dotted with several thriving villages. Passing these, we next went over to Antioch, by way of the "used to be" noted coal mines of the Mount Diablo district. Here we found the most desolate-looking region that my gaze ever rested upon. The mines are almost deserted now, and I hurried away as soon as possible, down into the San Joaquin valley, in the eastern portion of the county—a section quite familiar to the traveling public, as it is directly on the line of the S. P. R. R. and also bordering on the San Joaquin river.

I next went to Brentwood, and from there to that somewhat notable resort for invalids, called Byron Springs. There are in this place about a baker's dozen of the springs, each warranted to cure some particular disease, and the water of each separate spring tasting, if possible, more villainous than the others. However, the hotel here seems to be well patronized, and the managers are very pleasant gentlemen who have built up a very beautiful and convenient resort for all who wish to try the virtues of the water.

On my return trip to Oakland, I stopped awhile at the splendid mansion and grounds of Judge Robinson, situated on the river, a little below Antioch. If there is another spot in California that can surpass this, as a work of art, we have yet to see it. "A perfect paradise!" was my first and last exclamation at this lovely homestead. This is a portion of the great Robinson grant, containing over 30,000 acres.

From here I went through Willow pass via Concord and Pacheco, to Martinez, the county-seat, a large and thriving town situated on the Straits of Carquinez, and also on the S. P. R. R. This is a beautiful place and contains many fine residences, and as it is the main shipping point for a large farming country in the rear, the trade of the town is increasing very rapidly. In the immediate vicinity of Martinez are some of the best small vineyards in the State, among which we notice those of Dr. Strentzel, J. Muir, John Swelt, E. B. Smith, H. Raap, L. Eddy and many others, all of which produce the very finest varieties of both table and wine-grapes—the former growing on the flats, and the latter on the hill-land.

From this point we took the road again for Oakland, but lingered a short time in Alhambra valley, to inspect the vineyard of John Swelt. Here is a good illustration of what pluck and perseverance, aided by a little capital and a good deal of common sense, can do in creating a little garden of Eden out of what was but a few years ago nothing but a waste. Standing at the head of the valley near the school-house above Mr. Swelt's place, I recalled some of Irving's magnificent descriptions of Andalusian scenery, and came to the conclusion that this valley was happily named the Alhambra.

Hurrying on, I next reach the more than half Portuguese village of San Pablo, noted for being the home of the ancient Castros, "one of the early Spanish families," who still claim a very extensive tract of land in this valley.

Here we turn back to take in the Selby Smelting Works, and from thence down the bay shore, halting at all the powder-mills and

other factories which line the coast from Port Costa to West Berkeley. Night overtook me at the ranch of one of the old subscribers to the RURAL, Benj. Boorman, near Stege's station, Contra Costa county. I gladly accepted his kind invitation to stay over night with him, and while there had the pleasure of inspecting some of the finest specimens of horseflesh to be found on the coast. Mr. B. is very enthusiastic on the subject of thoroughbred stock, and has on the ranch at the present time three very handsome gray stallions of the noted Percheron-Norman breed, one four, one six and the other seven years of age, ranging in weight from 1400 to 1800 pounds. These animals are high-spirited, holding their heads well up, clean-limbed, with good action, and all lovers of fine draft horses would do well to examine Mr. Boorman's stock. Mr. B.'s ranch is also well stocked with a fine lot of colts and mares of the same or similar breeds, and taken altogether, shows very plainly that Contra Costa can hold her own in the way of raising fine horses with any county in the State.

From this place we drove into Oakland by the way of the University grounds and arrived at home travel-stained and weary but well pleased on the whole with our trip, and feeling that we had acquired some new ideas about Contra Costa county.

W. W.

From Modoc County.

EDITORS PRESS:—Your papers come to me regularly, and I assure you I particularly enjoy the RURAL. Occasionally I see some little mention made of this county, but not nearly as much as she should have or would have were her resources known. Modoc county has been to a large extent controlled by stockmen, who have in every way discouraged settlers coming in; but as the central and southern parts of the State have filled up, home-seekers have turned northward, and while this portion of the county is the extreme northeastern corner, many immigrants have arrived within the past two years, settled upon government land, and are now making themselves homes. The county has a different aspect now from what it had when I came here two years and a half ago. The time is not far distant when there will be a railroad through these valleys, and then you will see a rush to the North equaling what there has been the past year or so to the South.

This (Goose Lake valley) and a number of others—Fall River, Big Round, Hot Spring and Surprise valleys—are of considerable extent, and have a soil as productive as is to be found in any part of California. Goose lake is a fine body of water, 45 miles long with an average width of 12 miles. On the eastern shore, the whole length, are to be found many fine farms.

This has been a poor grain season; but notwithstanding that, many of the farmers have produced from 30 to 45 bushels of wheat, 50 to 70 bushels of oats and about 40 bushels of barley per acre. Prices have been good; wheat from 1½ to 1¾; oats, 1¼, and barley, 1¼ per pound. There was over an average crop of hay, and as fine Timothy and Red Top as ever grew.

Many of the farmers have put out small orchards, which they did as experiments, for many thought fruit would not do well here. A few of the trees have come into bearing, and proved that the climate is particularly adapted to apples, of which I think I have seen as fine grown in my immediate neighborhood as I have ever seen in any part of California. Knowing you to be a better judge of such things than I am, I have sent you per to-day's express, via Reno, a small box containing samples of 11 varieties of apples grown here.

Our altitude is 4679 feet above sea-level; nevertheless, we raise as good vegetables as the San Francisco market affords. Owing to the fact that they grow very rapidly, they are tender, juicy and of fine flavor. I put in the box two of our "Modoc lemons," alias spuds, alias potatoes, than which no county in the State raises better, as I think you will say when you come to eat them.

I wish you could take a trip up here. You would enjoy it very much, I am sure—good hunting and fishing, fine climate, best of water, and plenty of it. All we lack is a boat on the lake to give us an opportunity for any kind of enjoyment. Hoping this may find you and family in good health, and that the box will reach you in due time and the contents be acceptable, I remain truly yours,

GRANT I. TAGGART.

Willow Ranch, Modoc Co., Nov. 5, 1887.

[The box came safely, and the contents proved excellent. We thank our correspondent and should be pleased to have him write again.—EDS. PRESS.]

AMERICAN FOR THE BEST.—In the new yacht which won the race on the occasion of Queen Victoria's jubilee, and now supposed to be the fastest in the world, the masts are of Oregon fir. The fine woods from Australia, Norway, and all other countries where mast timber is secured, were tested thoroughly and rejected as not equal to our fir.

PRINTED MATTER may be copied on any paper of an absorbent nature by dampening the surface with a wet solution of acetate of iron and pressing it in an ordinary copying press. Old writing may also be copied on unsized paper, if wet with solution of sulphate of iron mixed with a simple solution of sugar syrup.

THE VINEYARD.

Difficult Fermentations.

University Experiment Station Bulletin, No. 75.

Complaints of difficult fermentations have been very general during the vintage just past, and a great deal of red wine especially has refused to "go dry" within the usual or any reasonable limit of time. It has long been my conviction that in the vast majority of cases the difficulties complained of arise from excessive heat during and particularly at the beginning of fermentation. At the end of last year's vintage, a number of comparative fermentations were made at the University Viticultural Laboratory, partly with a view to testing this question; but it being late in the season, the only grapes available for the purpose, viz., second-crop Zinfandel, were not of a character to test the point, having high acid (.65) and low sugar (21.6); and the high temperature attained seemed to accelerate, rather than retard, the fermenting process. This season, 16 fermentation experiments, parallel with those of last year, have been made, and the results of some of these throw so much light upon the causes of "difficult fermentations" that it seems proper to give publicity to them in advance of any detailed report on the whole series.

Equal charges of 200 pounds each were fermented in 50-gallon tanks, save that in the hot fermentations 25 pounds more were used, in order that the rise of temperature might be favored by greater mass. In the hot chamber a temperature of between 85 and 90 degrees was maintained; while in the fermenting-room in which the other charges were being treated, the temperature was kept as nearly as possible at 75 degrees. The grape employed was a fine lot of Carignane, courteously donated for the purpose by A. J. Salazar Jr., of Mission San Jose. The must showed 25.75 per cent by spindle, and .53 per cent, or a little over five *pro mille*, of acid.

Of the tanks in the fermenting-room, filled with mash at 63 degrees, three, treated by usual methods, went practically dry and were sent to press on the seventh day; the first to finish being the one with "floating cover and twice-daily stirring," the method adopted in the laboratory for general purposes. The highest temperature reached by any of these was 95 degrees.

On that day (7th) the two tanks in the hot chamber, which had in setting been warmed up to 86 degrees and at first fermented most violently, and in 43 hours attained a maximum temperature of 106 degrees, had come down to very slow movement; the actual solid contents were found to be a little over 12 per cent. It being obvious that they would not "go through" under existing conditions, the two charges were divided into four parts, of which one was left in the hot chamber and treated as before, in order to observe the outcome. The others served for experiments to test the best mode of reviving the fermentation in the lower temperature of the fermenting-room.

One portion received 1½ per cent of pomace, freshly pressed from one of the other tanks, and well stirred in; floating cover put on and well stirred three times daily. Fermentation soon revived, and went on slowly, but steadily, until the seventh day, when the charge was sent to press, practically dry.

One, a double portion of 19½ gallons, was mixed with 2½ gallons of condensed Zinfandel must set at 21 per cent with distilled water, and having been allowed to pass into active fermentation before mixing with the "stuck" mash. Fermentation soon set in, and slowly but steadily carried it to dryness on the 17th day, being eight days from the time the fresh must was added.

The fourth portion was left without any addition, but was from the time it left the hot chamber vigorously aerated, by means of an air pump, three times a day. Fermentation soon revived, and the charge went dry and was sent to press at the end of the sixth day from the time it was removed from the hot chamber, being nearly two days in advance of the other tanks treated with pomace and must respectively, but aerated only by ordinary "foulage" with a cross-per stirrer.

It thus appears that simple aeration, without the addition of any new yeast, was at that stage of the mash that had "stuck" in consequence of overheating, the most effectual mode of reviving and completing the fermentation. The pressed wine had the same acid-percentage as the original must, and is free from acetic taint.

As for the portion that remained in the hot chamber, it continued a feeble action for some time, but on the 14th day from the setting of the mash it had practically stopped. It was then removed to the fermenting-room, and after cooling down to 75 degrees and aerating by the pump, a faint revival of fermentation took place for 36 hours. Then the cap sank and the tank was "dead." The day after, the odor and taste of milk-sourness became so patent that the mess was sent to press with over nine per cent of solids, as a dead failure, on the 17th day; a woful, but in practice but too familiar example of the results of hot fermentations.

I reserve for the future a detailed discussion of the subject, in connection with other experi-

ments, but the main points illustrated may be briefly thus stated:

1. While musts of low sugar contents and high acid may be successfully rushed through to dryness at a high temperature and make a sound wine, the same is not true of those having high sugar and low acid; the margin of difference between the two cases is a very narrow one, both as to temperature, acid and sugar, and hence a few days of hot "norther" may easily turn the scale.

2. When the temperature has not been excessively high, and not maintained too long, simple aeration by means of a pump or blower may revive it at a lower temperature. Sound pomace, or fresh fermenting must, are additions to be used when available or necessary.

While these facts and principles are not new to experts, I have thought it worth while to re-establish them by facts and figures, and to offer them as a substitute for the supposed mysteries of "difficult fermentations" that have so vexed our winemakers. The vatting of hot and overripe grapes and the omission of proper aeration of the mass, while allowing the surface to acetify, are responsible for nine-tenths of all unsoundness in California wines.

E. W. HILGARD.

Berkeley, Nov. 17, 1887.

The Condensed Must Establishment.

So many allusions have been made to the Springmuhl condensed must establishment which has been put in operation this year at Geyserville, Sonoma county, that no doubt many readers will be interested in the following description which we find in the Healdsburg Enterprise:

It is of general interest to the State at large to learn of the complete success of Dr. Springmuhl Von Weissenfeld's condensing machinery now in operation at Geyserville, Sonoma county. Its first use is in condensing grape must to one-third its original density, thus preventing any fermentation, and preparing it for shipment to London to be made into wine.

The capacity of the condensing machinery is four tons of grapes per hour, though it is only being run to half its capacity this year. Thirty men are employed in the works, some engaged in making barrels, while others are handling the grapes in their different manipulations. The machinery is kept in operation day and night. A. S. Howard is superintendent, C. A. Morrill, foreman, and Walter Lawson, chief engineer.

On an elevation are two large chambers which are called the condensing pans. In the bottom of the pans are pipes running crosswise similar to the tubes in a steam boiler, through which steam passes. The steam is generated in an immense boiler, heated from a furnace of four sections. Pumps are used to exhaust the air from these condensing pans, making a complete vacuum. The grapes are received from the wagons into an elevator and carried to a crusher which is on an elevation of about 30 feet. The stems are removed, while the grapes are crushed and thrown aside as refuse. The juice or must is separated from the pomace and run into a large tank which is below the ground floor. The pomace is carried to a hydraulic press, where it is given the heaviest pressure possible. Herein is the greatest obstacle of the process. The power of the press is insufficient to expel the entire quantity of juice and leave the pomace entirely dry, which is absolutely necessary and an essential part, for no juice should remain in the pomace.

To overcome this difficulty the pomace is pressed for the second time in a screw press, worked with a lever and by hand-power, making it a very slow process. To this part of the operation the inventor gave the least consideration, having confidence in the presses now in use, and consequently the must-condensing machinery has been delayed in its operation on account of its being impossible to have the pomace pressed with the same speed as the condenser does its work. When the condensing pan is made a complete vacuum the must is received into it by opening a valve, which is connected by a pipe with the tank of must, and according to hydraulic principles, the pan is filled to the desired depth. The steam is then introduced into the pipes at the bottom of the pan, and in a very few minutes the must is boiling at a furious rate. The temperature of the must during boiling in vacuum varies from 104° to 112° F. It is by the low temperature in boiling that the aroma, commonly called bouquet, and natural flavor is retained in the must, as well as preventing it from burning. The evaporation that takes place is entirely of water, the sugar remaining in the must. Large quantities of cold water are used to condense this steam, and pumps are used to remove it without allowing air in the vacuum. For four hours this boiling continues until the must is reduced to one-third its former bulk; that is, the must, composed of 23 to 28 per cent sugar before entering the condensing pans, is reduced until the sugar is increased to 75 per cent, when it is finished. A valve is now opened and the boiling at once ceases, the steam is shut off and the condensed must is ready to be drawn off. The dry skins and seeds, or the pomace proper, is saved, and as the condensed must is run into a trough the skins and seeds are thoroughly mixed with it, after which it passes into the 50-gallon barrels for shipment.

Thus it will be seen that no property of the grape has been removed that is essential in

making wine. All the sugar is retained with the bouquet and natural flavor, and the seeds and skins contain the desired tannin. The must thus condensed will keep from fermenting for years, and will improve with age as well as wine, so that after two years wine can be made from the condensed must of as good a quality as wine that was aged to that time. The converting of the must into wine is a simple process. Distilled water is added to the must until the proportion of sugar has been reduced to its former state—that is, to 23 to 28 per cent—and having the temperature favorable, fermentation will commence just the same as though it were fresh from the grape.

Fifty gallons of condensed must will make 150 gallons of wine. Thus it is seen that 50 gallons of must is equivalent to one ton of grapes.

Dr. Weissenfeld's invention is of more importance than is at first supposed. In the first place, the must is shipped to London free of duty, for it is not a spirit, but merely a fruit juice, and is not liable to any duty. A new market is also opened, which, comparatively speaking, is so large that it is impossible to supply the demand. The wine made from this must can be sold at a figure far below the present price of wine in that country and still allow a per cent for dividends.

The same plant can be used in making an extract of tanbark, and 10,000 cords, which can be readily had in Mendocino county, will be wanted in all probability as soon as the grape season is over. The plant can also be used to condense milk, and an effort will be made to induce the ranchers of the vicinity to keep more cows and supply milk, which, when condensed, will be taken to the San Francisco market. Only water would be extracted from the milk, which can then be kept for 30 days, and when the same quantity of water is added, it is as pure as the fresh milk and more healthy than the milk commonly used in cities.

A new town has been laid out, and a railroad station called Springmuhl has just been erected. Mr. Shorb and Dr. Von Weissenfeld have bought a tract of land around Springmuhl station, and a number of houses and cottages will be built for the employees of the firm. The whole land bought, except the part reserved for the town, will be planted with vines and will be cultivated by employees of the must company.

ENTOMOLOGICAL.

Spray and Band Treatments for the Codlin Moth.

University Experiment Station Bulletin, No. 75.

During the summer of 1887 careful observations have been made of the efficacy of spraying with arsenical compounds and of the band treatment for the reduction of the codlin moth, *Carpocapsa pomonella*. This insect appeared in the University orchard a few years ago, and during last year was quite abundant. The success reported by Prof. S. A. Forbes, State Entomologist of Illinois, in spraying with Paris green for the destruction of the larvæ as soon as it begins to feed in the calyx of the apple, and similarly good results reported by several California apple-growers, suggested that a set of experiments with arsenic and its compounds should be made in the University orchard, where more time could be given to an accurate account of results than a busy fruit grower could devote to such work. As it was known that W. G. Klee, State Inspector of Fruit Pests, was conducting similar experiments on his own farm and was keeping accounts of experiments by others, it was thought best that the University experiment should be given a direction similar to his, that the results of all experiments could finally be brought together and serve for purposes of a wide generalization. For this purpose Mr. Klee was invited to prescribe the applications to be made. He did so, and assisted personally in the preparation and application of the poisons—a service for which we make due acknowledgment.

Application was made of three substances, white arsenic, Paris green and London purple, and each in different strengths, as will be specified in the tables which will be given below. The white arsenic was dissolved in hot water; the Paris green and London purple were kept as thoroughly stirred as possible while being drawn up by the pump. The drenching of the trees was quite complete, the spray being especially directed upon the clusters of fruit which in most cases were still upright, so that the drops of the liquid were caught and held in the calyx end. There was, of course, much difference in the size of the fruit, as the orchard comprises a large collection of summer, fall and winter fruit. Trees were selected, however, as carefully as possible, which had the fruit of the best stage of growth, say from the size of a pea to that of a small marble, at the time of the first spraying.

The tables will show that in most cases three applications were given, all within 30 days from May 3d. During that period the records of the University meteorological observatory show that rain was measured but once, and then but one-twentieth of an inch, and in the month of June there was but a sprinkle, even less in

amount, so that the weather was perfect for the retention of the poison on the fruit.

The University orchard is planted with two trees of each variety, and in these experiments one was sprayed and the other reserved without treatment, so that a comparison, each tree with one of its own variety and age, could be made. The orchard was guarded in such a way that no outside interference could be had with the fruit. Twice a week all the fruit which fell from the sprayed trees and from the check trees, unsprayed, was examined and careful entry made in a book prepared for the purpose, of all worms found in the fruit, of all fruit from which the worms had escaped, and the number of worms found under the bands of sack-cloth, which were placed upon all the trees. This plan of procedure was faithfully carried out until November 1st, when all the fruit remaining at that time was removed from the trees, examined for worms and the experiment closed.

The following tables show a summary of results. The full report, with details of procedure and deductions therefrom, is reserved for our next annual report.

was secured by a string tied around near the center so as to furnish crevices at both the upper and lower edges, to accommodate worms coming from either direction. All these bands were removed on a certain day each week, the larvæ counted and killed and the bands replaced. At the same time all the fallen fruit was gathered, examined for worms, or to see if worms had escaped, and records of these facts kept separately. The full statement of this investigation is not yet ready, but a brief summary of leading results may be given as follows:

Row No.	Larvæ under bands.	Larvæ in fruit.	Other damaged fruit.	No. trees in row.
Pears 9.....	31	27	71	22

These applications were all made to effect the first brood of the moth. The figures of infested fruit are all small, for in Berkeley, as in most places along the coast, at least, the first brood of the moth was unusually small this year. This fact would not necessarily interfere with the percentage of gain by the treatment.

In the case of the white arsenic the record of worms is so small and the result so contradictory in that the stronger wash gave a percentage of loss while the weaker gave a percentage of gain, the inference is that the worms were not on hand to be killed. Undoubtedly allowance must be made for chances of this kind in all experiments including only a tree or two. One codlin moth is said to deposit anywhere from 50 to 200 eggs, and so a single moth by presence or absence might produce a great difference in an experiment. When the pest is abundant there is of course less danger of such results.

The experiments with Paris green and London purple are more satisfactory, as more trees are included, and worms are found on all, which shows that the moth visited the trees more freely. The percentages of gain must be considered very satisfactory, and the stronger applications, barring injury to foliage, produce the best results. In the case of Paris green, the application of a wash with one pound of Paris green to 160 gallons of water must be regarded as very satisfactory, giving a gain of over 70 per cent of good apples and pears and not doing any injury to foliage or fruit. The susceptibility of trees to injury seems to vary with the kind of fruit and the variety as well, and may be affected by other conditions. This is a matter which needs full investigation.

Examination of the Band Treatment.

In order to determine some points about the efficacy of banding apple and pear trees for the destruction of the larvæ of the codlin moth, an accurate record has been kept in the University orchard during the past season. The bands were put on early and consisted of strips of old sacks. The strips were five or six inches wide; the ends were allowed to lap well and the band

20.....	163	61	320	26
21.....	83	40	153	25
22.....	32	22	81	21
23.....	74	31	191	16
24.....	3	0	8	9
Totals.....				1188 608 2704 457

This summary shows that while 2704 apples and pears were found from which worms had escaped, there were found under the bands but 1188, or 44 per cent, the remaining 56 per cent includes worms which found nesting-places elsewhere or perished. The assistant, who kept the record of this experiment, assures me that he believes many of these were eaten by birds which were always working over the ground while he was in the orchard. The others must have concealed themselves under cloths to spin their cocoons, for there is no loose bark on the trees, and no rubbish or fences in which they could hide. It would seem from this experiment that the bands catch less than half of the worms which gain access to the fruit, and yet the destruction of this proportion of fully fed and healthy larvæ must be considered very satisfactory. As all the losses by birds or other enemies of the worm by accident and by other agencies which destroy insect life must be taken from the percentage of worms not found under the bands, it will be seen that the old method of treatment is still one of the most effective that can be employed.

E. J. WICKSON.

Berkeley, Nov. 19, 1887.

A DANGEROUS INVENTION.—A Russian lieutenant of engineers has perfected an apparatus for intercepting telegraph and telephone messages in time of war. The apparatus is contained in a small oblong box and weighs rather less than three pounds. The telegraphic receiver is of the recording type, and a battery for returning false messages to the enemy forms part of the equipment. An invention of the nature above described cannot fail to be dangerous in the hands of unscrupulous persons.

PATRONS OF HUSBANDRY

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

The Grange and the Signal Service.

At a meeting of the San Jose Board of Trade last Tuesday week, Bros. Pettit and Sanders were introduced as representatives of the Grange, and the latter proceeded to speak of the U. S. Signal Service. As reported by the *Mercury*, he said that the prognostications are made with great care, and the bulletins issued are reasonably reliable. These bulletins would be sent to any one desiring them from the signal station at S. F. free of charge. Leading papers give them regularly and the results in many instances are valuable. The farmers, however, could not always send for bulletins, nor could they always get their daily papers. The Grange Committee has considered this matter and come to the conclusion that a regular code of signals, exhibited from some salient point, would be of great value to them, as they could see it without coming to the city. They had thought of the courthouse flagstaff and the electric-light tower, and were even on the point of waiting upon the manager of the *Daily Mercury* to ascertain if some arrangements could not be made for the displaying of certain signal ensigns from his building. He thought the Grange would be willing to furnish the flags, etc., if the board could suggest or devise some means of securing the assistance of some one who would pay attention to the matter, and raise or lower flags in accordance with the changes in the bulletin.

President Moody thought perhaps the papers would be loth to assist in an enterprise of this kind, as it would deprive them of a good item and might possibly cut some figure in their subscriptions.

Mr. Sanders thought it would cut no figure at all. He said he was a regular subscriber of the *Mercury*, although he received his mail but two or three times a week. They would all want the papers.

Mr. James moved to appoint a committee of three to investigate the matter and see what could be achieved. Carried. Messrs. James, Oadwallader and Potts were appointed.

State Grange Mention.

The State Grange was organized at Napa City, July 15, 1873, there being 36 Granges then eligible to representation: No. 1, Pilot Hill, El Dorado Co., first organized, several years previously, then being dormant. Of the representatives present at the organization at Napa, there were five charter members in attendance at the recent session in Santa Rosa, viz: G. W. Davis of Santa Rosa Grange, Nelson and Hannah Carr of Bennett Valley, A. T. and S. H. Dewey of Oakland; Past Master S. T. Coulter, also attended that part of the organizing session, held in the fourth degree only. Interested ever in the farmers' cause, he was one of the few good Patrons present outside of the State Grange representatives. Ever since that session, nearly all transactions of the State Grange have been in the fourth or subordinate degree. Some time we hope all the State charter members will hold a reunion, inviting all veteran Patrons to join in a recital of the pleasures and incidents of "long ago."

EXCOMMUNION ON BRO. WEBSTER.—A Creton correspondent of the San Luis Obispo *Tribune* is warm in his admiration of Bro. Webster's achievements. He says: The successful exhibit of the Hon. J. V. Webster at the fair of the various products of this section of country seems to have been a big surprise to croakers on the other side of the mountain. They had proclaimed it to the world, in a manner, that there could be nothing grown over here; the land was no good, climate too hot and dry; all this country was good for was for a stock range. . . . I understand that on his exhibit of grapes he had to compete with the best the vineyardist could raise on the coast side, and in other articles he stood out grandly alone. It is conceded that you can raise on the coast side many of the common and coarser products of the farm, such as squashes, pumpkins, beets and the like, but when it comes to the finer articles, extra grapes and other choice fruits, with sugar-cane added, we are away ahead. The products of our soil on this side of the mountain grace the tables of those who wear purple and fine linen. Such men as Hon. J. V. Webster are going to accomplish all that is claimed for this section. A few such men are of more worth to the development of the country and the actual increase of wealth and population than all the big cattlemen and grain-ranchers combined, for they utilize their land to the best advantage in paying crops, giving employment to many, while the others grasp for a large scope of country, shutting out an increase of population.

PAST MASTER COULTER will speak at Oakland, December 31. Other P. M.'s and State officers are expected to take leading parts.

STOCKTON GRANGE, Secretary Root writes, will celebrate on December 3d. All other San Joaquin Granges are invited to co-operate.

Pomona of State Grange.

Our engraving represents with photographic accuracy Mrs. E. Z. Roache, as she appeared dressed for the Pomona Feast at the late session of the California State Grange, at Santa Rosa. The beautiful form and brilliant, variegated hues of the natural grapes and other fruits, composing the sash, bouquet and head-dress, with her commanding figure and queenly bearing, won the admiration of all beholders.

She was born in 1853 at Aurora, Ill., where in girlhood she attended the public school. At the age of 13 years, she organized and taught a private school, and by teaching from time to time earned money enough to obtain a musical education. Entering the State Normal school at Bloomington, she took the full course of that institution and graduated well up toward the head of a large class.

After nine years' successful teaching in El-

voice she has richly entertained and highly edified them.

Her original recitals and selections have always been such as to stir deeply our love for poor humanity, and animate our hearts with nobler purposes, and nerve our hands to better deeds. Those who have listened to her eloquent appeals for equal rights for her own sex—and all humanity—will never forget Sister Roache, or cease to admire her for her devoted and able efforts.

Brother A. P. Roache, her worthy husband, as a member of the literary and other committees, during the past four sessions of the State Grange, as well as by his original contributions and recitals, has fairly earned the favor of his fellow-Patrons, and was well entitled by his fidelity to the cause and well-trained abilities to the office of Steward to which he was chosen. Laboring unitedly on their farm, near Watsonville, Brother and Sister Roache are happily climbing together the hill of hard-earned success. In favor of woman suffrage and equal

Photo by Piggott, Santa Rosa.

MRS. E. Z. ROACHE, AS POMONA OF STATE GRANGE.

gin, Chicago and other cities, she began to feel an urgent need of rest. Having by this time laid by considerable money, she indulged herself in the tour of some of the principal Eastern cities, visiting the Centennial Exposition at Philadelphia, and going thence to New York, Boston, Niagara Falls, Toledo, Washington and other places.

But California, it appears, was the Mecca of her desires, for which she presently set forth with the courage so characteristic of all her actions, and February, 1877, found her in San Jose, alone and an utter stranger. By the 24th of that month she had secured a school and commenced teaching at Watsonville. A year later she received a life diploma, and on Feb. 22, 1878, married A. P. Roache of Watsonville, where she now resides.

Soon joining the Grange, she was repeatedly chosen Lecturer and is now Overseer. About two years ago she was elected to the Board of the Grangers' Union Co-operative store, and has this year been made Vice-president of the Pajaro Valley Fair Association.

All Patrons may well be proud of their Pomona for the past two years, for by pen and

rights, they practice as they preach, keeping but one purse held in common possession between them. They certainly well deserve a noble success whether accorded them in this selfish era or not.

Both have kindly and intelligently supported the Grange and Agricultural Press, and ardently labored for the establishment of the Agricultural Fair recently held with success at Watsonville.

In common with Patrons of California best acquainted with the sensible, modest and faithful services of Sister Roache, we are proud to bear our testimony to her rare abilities and virtues.

Grange Day Celebrations.

The twentieth anniversary of the Order of Patrons of Husbandry will be duly commemorated at Oakland on Saturday of next week by Eden and Temescal Granges, who invite all Patrons in good standing to join with them on the glad occasion.

Enterprise Grange, Sacramento Co., has decided to commemorate the birth of the Order of

Patrons of Husbandry by calling the Grange together at 10 A. M. December 3d. Will confer the fourth degree on a class, have a Harvest Feast and a general good time.

Rev. Dr. C. C. Stratton, the able and eloquent president of Mills seminary, will address Tulare Grange Dec. 3d, appropriately to P. of H. birthday. We presume all farmers are invited.

Sacramento Grange has invited the other Granges of that county to join in a hearty celebration of Grange birthday. Further particulars next week.

The National Grange at Work.

Telegraphic reports to the S. F. dailies show that the National Grange got down to its work promptly.

LANSING, (Mich.), Nov. 16.—The twenty-fifth annual session of the National Grange was called to order in Representative hall this morning by Worthy Master Put. Darden of Mississippi. The Committee on Credentials reported representatives from 31 States present.

The Worthy Master's annual address shows the Order to be in a very prosperous condition, 174 new Granges having been established since last report and many dormant ones revived. The State Grange of Nebraska has been re-established. With Rhode Island, which has recently fallen into line, the circle of States is now complete. The address commends the Interstate Commerce bill, and recommends having agriculture represented in the Cabinet.

After him short addresses were made by E. A. Giller of Illinois and others, and in the afternoon a public reception was given the National Grange by the local Grange of Lansing and citizens. The address of welcome was given by Michigan's Granger Governor. The prettiest feature of the reception was the exercises of 36 young ladies of the city, who personated Columbia and the sisterhood of States in costume.

William L. Overhiser, Master of the State Grange of California, has brought here a carload of the products of Northern and Central California, which will be placed on exhibition tomorrow. When this meeting is over, Mr. Overhiser says, it is his intention to present this exhibit to Chicago with a promise to enlarge it and keep it replenished.

Nov. 17.—The Grange held a closed session this morning, when the Secretary and Treasurer made their reports. The former showed the satisfactory progress of the Order. Resolutions were introduced and referred favoring the establishment of a postal telegraph system, changing Section 4 in the interstate railroad law, asking for a law prohibiting the adulteration of food and dealing in futures, and asking for representation in the Cabinet.

Reduced Postal Rates for Seeds and Plants.

Nov. 19.—At to-day's session of the National Grange of Patrons, nearly 1000 people were present. It was decided to make the United States Commissioner of Agriculture a member of the National Grange whenever he is a Patron. The Secretary of the National Postage Improvement Company sent a communication. He proposes a plan to reduce the postage on seeds, the use of fractional currency in the mails, the abolition of postal notes, and the issuing of money orders of \$5 or less for a fee of three cents. Lecturer Whitehead reported that he had visited 23 States, delivered 263 lectures, and circulated 6000 tracts and circulars. The afternoon and evening sessions were occupied in conferring the fifth and sixth degrees.

The California Exhibit a Great Center of Attraction.

The California exhibit continues to be the center of attraction. The California grapes probably excel those of any other State, and they are here at their best. A large display of silk, silkworms and cocoons is a very interesting feature. At the close of the meeting these will go to Washington, while the fruit, wines and the balance go to Chicago on permanent exhibition.

Modifications in the Patent Laws.

Nov. 21.—At to-day's session of the National Grange constitutional matters were discussed. It was concluded to allow the sixth degree to be conferred by subordinate Granges. A resolution recommending a reduction of the postage on seeds, the abolition of the system of postal notes and reissuing of fractional currency was adopted.

The Executive Committee recommended the establishment of a permanent bureau in Washington where the secretary can have an office and keep his records. Amendments were also recommended to the patent laws, the Grange believing they were working an injury to the agricultural classes.

Friendly Words From Tulare.

DEAR FRIEND AND BROTHER:—Tulare should feel honored in the choice made for the meeting of the next State Grange, and I have not the least doubt but that she will do her best to prove, and will prove, the wisdom of the Grange in their selection.

We have not many side-shows here, but nevertheless they are all here potentially; and the men and women who will come representing the good sense of the Grange will see be-

neath the surface of things, will perceive, beyond the much that has been done in creating a new country, the greater that can and will be done, when men, muscle, money and mental activity will, as they must, take hold of this long-neglected part of California and develop its reserve resources.

Then it is possible—some say probable—that railroads will be here, before the State Grange, that will convey visitors to the foothills, perhaps into the mountains, where are the largest trees and finest scenery outside of the Yosemite valley, as I am told.

Perhaps a visit to the Kaweah colony would be interesting to the curious and to those who are studying the social problems of the day. This colony, I believe, holds possession of the Giant forest, a fine deposit of marble and other mineral wealth. Then there are the Fresno colonies, all worth seeing. I know how busy you must be. I congratulate the readers of the *Patron* on the great improvement in appearance and matter.

Busy plowing and getting ready for next harvest. Yours sincerely and fraternally,
J. W. MACKIE.

[We hope to hear often from Brother M. and other Tulare Patrons.—EDS.]

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

CITRUS FAIR.—*Mercury*: Let the world take notice that on Tuesday, the 20th day of December, 1887, the first annual citrus fair will commence in Oroville, the county seat of Butte county, and continue until Saturday night, the 24th. Everybody cordially and respectfully invited. About \$2300 have been raised to defray the expenses, and as nearly all the fruit will be donated, there will be funds enough to conduct the fair in grand style. The pavilion is to be 50x150 feet, about 40 feet high, the floor will be of matched lumber, high and dry, and electricity will probably be used for lighting.

RIPE ORANGES.—*Chico Enterprise*: This morning W. L. Bradley brought to this office two fine ripe oranges, and this is only the 12th day of November, so that we are only one week behind Oroville in ripe citrus fruit, and two months ahead of Los Angeles. Mr. Bradley has some 300 or 400 young orange trees now growing.

Contra Costa.

SAN PABLO NOTES.—*Item*, Nov. 16: Spud-digging is progressing in the valley. The farmers have baled all their spare straw and are hauling it to Berkeley, where they get 50 cents a bale for it, about 30 cents of which is clear profit. This means for a man, wagon, and team, \$7.50 per day as long as the straw lasts. Winter apples and pears are exceptionally good this year, the damage done by the codlin moth not being so extensive as in previous years, though no means have been employed for their eradication.

A NATURAL FLAG-POLE.—One of the attractions of our town, and one which probably few other towns can boast of, is a natural growing flag-pole. In the lot of County Clerk Wittenmyer, near the Congregational church, is a eucalyptus tree that in the last few days has been trimmed up straight as a spar a distance of 112 feet from the ground, with a head of foliage left on top. James Stewart furnished the flag and halliards, and Mr. De Pue, one of our 200-pound solid citizens, volunteered to place the national colors at this dizzy height on the swaying, slender mast—which he successfully accomplished. Hereafter the "stars and stripes" will float from the lofty top of a tree of our own growth. Another instance of Martinez home production.

El Dorado.

IRRIGATION ENTERPRISE.—*Placerville Observer*, Nov. 15: It is pretty well understood that the Walker brothers of Salt Lake City have offered the Cal. Water Co. \$400,000 for its ditch property, and have already purchased the Fairchild ditches and water right. This secures to them something over 5000 inches of water. They are already constructing a ditch which will be about 60 miles long, and will supply water to those points not at present reached by the Cal. Water Co.'s system. There is also talk of conducting this water into Placer county for irrigating purposes, but this will probably not be done, since all the water will be required within this county after the next three or four years, if the present rate of increase in acreage of fruit continues.

FRENCH PRUNES.—C. Lent of the El Dorado Fruit Ranch has our thanks for a box of the finest dried French prunes we have ever seen. The ranch, of which Mr. Lent is supt., has demonstrated beyond a doubt that the El Dorado foothill-lands will produce this fruit equal to the best imported from foreign lands, and that it is one of the most profitable crops we can handle.

Fresno.

ALMONDS BY THE CARLOAD.—*Fresno Expositor*, Nov. 15: The Grangers' Business Association shipped a carload of soft-shelled almonds to San Francisco this morning. This is the first shipment of the season, and we believe the first carload ever shipped from the county.

Humboldt.

CHEESE-MAKING.—*Ferndale Enterprise*, Nov. 11: We took occasion last week to visit the

Vedder cheese factory, and were surprised to see the thoroughness with which it has been fitted up. The factory is run on the community principle, the milk being furnished by 22 of the neighboring dairymen. Mr. Vedder receives two cents a pound for manufacturing the cheese. Eleven hundred 50-pound cheeses have been made this year, and Mr. Vedder says he has every reason to feel encouraged in his undertaking. This year's business far exceeds that of the previous year, and he intends building a large addition to his already spacious factory. His curing-room now contains about all the cheeses it will hold, and he has found it inadequate for his use. As to the profit to dairymen in this institution, the milk, which, in the shape of butter, would bring them 20 cents, would return 30 cents if made into cheese. Mr. Vedder says the climate could not be better for cheese-making. No better evidence of this fact can be given than the cheese itself. It is as good as the best in the market, and in S. F. commands the highest price.

BRINGING IN MERINOS.—*Standard*: J. S. Cummings, the enterprising wool-grower whose ranch is on Mad river, brought up on the Chester yesterday a number of thoroughbred Spanish merino bucks. They are a fine-looking lot of sheep, and will be taken at once to his Three Cabin ranch.

Inyo.

STORAGE DAM.—*Independent*, Nov. 12: The project so often mentioned of damming the lakes west of Bishop creek is now in a fair way to be realized. The lakes are about 20 miles from the town. Men are now at work clearing the ground for the foundation for the dam. The money for the work is provided by parties in S. F. Water enough can easily be stored to irrigate at least 8000 acres of land. One mile below the dam the canal will enter the land to be irrigated. When the project was first proposed it met with a good deal of opposition from settlers along Bishop creek. More thorough study of the subject has convinced these parties that the work when completed will benefit them in many ways, and all opposition has ceased.

Lake.

POTATO PROFITS.—*Avalanche*: R. P. Eachus this year on 1½ acres dug 12 tons of potatoes, a profit of about \$250 per acre over all expenses. Who says it doesn't pay to raise potatoes in Lake county?

Los Angeles.

CASTOR PLANT.—A *Pomona Times Courier* reporter has lately seen a 2½-year-old castor plant which is without an equal in the neighborhood. It was planted two years ago last July on the place of Richard Mason on Holt avenue, and now measures 30 inches in circumference at the ground, 34 inches at the first crotch. Its height is about 12 feet, and its branches extend over a circle 30 feet in diameter.

BARN AND HORSES GONE.—*Compton Cor. L. A. Times*, Nov. 11: John Gries' large barn was burned last night. It contained 30 or 40 tons of hay and 15 horses, some of them very valuable blooded stock, among which were two valued at \$1000 each. Entire loss, \$10,000 to \$12,000. Small insurance only on the barn.

WALNUTS.—The walnut crop is being shipped and wagon-loads are passing through Anaheim every day on the way to the depot. Walnuts are priced at from 10 to 12 cents per pound to the producers. R. H. Gilman has sold his to Alison, Gray & Co. for 8½ cents. His crop will bring \$3500. Mr. Gilman shipped a ton of Japanese persimmons to S. F. yesterday.

Marin.

RECLAIMED MARSHES.—*San Rafael Journal*, Nov. 17: Owners of Salt Marsh will be interested in a dredging machine now working on the tract of land lying alongside the Novato creek. She is deepening an old China-cut ditch that was originally two feet deep and 22 feet wide. The ditch is made six feet deep its entire width, and the material placed upon the levee alongside; and the dredger is doing this work at the rate of about 350 feet a day. The ranch on which this work is being done is the "Novato Meadows," owned by John W. Ferris. It has been reclaimed eight or nine years, and gives ample proof of the value of our salt marshes. One of the rented farms upon the property, which has altogether 2200 acres in the reclaimed portion, produced last season an average of 40 bushels of barley and 1½ tons of hay to the acre. The ditch is being cut to promote thorough drainage, rather than to increase the levee.

Merced.

A CANAL PROJECTED.—*Stockton Independent*: A corps of surveyors are now running a line for a canal on the east side of the San Joaquin river, taking water from the San Joaquin river at Firebaugh's, in Fresno county. When completed, it will irrigate about 20,000 acres of the finest land in this valley, passing by Atwater and Livingston, Merced county, and emptying into the Merced river at or near Snelling. The head movers in this enterprise are J. J. Stevenson and J. W. Mitchell of the East Side Canal & Irrigation Co., with J. Boggs as chief engineer, and it will be known as the Grand Central Canal Co.

Napa.

LATE PEACHES.—*Napa Register*, Nov. 15: G. J. Turton places upon our table peaches of the late Baldwin variety, grown on his place near Trabody station. He has 70 or 80 boxes of them to put on the market between this and Thanksgiving.

CHERRY BLOSSOMS.—Cherry trees (Black Tar-

tarian) in blossom November 15th in Mrs. Begelsbacher's dooryard at Napa. What think ye of that, residents of the east country?

Placer.

'SIMMONS.—*Auburn Republican*: In the uncultivated lot owned by Mrs. Dunlap, next to the Putnam house, is a little Japanese persimmon bush not over four feet high which has borne an astonishing quantity of fruit this season. There must be nearly a bushel of persimmons on the bush, or was until the donkey got at it the other morning and ate about half of them.

San Joaquin.

ALMONDS.—*Lodi Sentinel*: O. J. Hemphill brought to this office Nov. 12th a sample of four different varieties of almonds, which were raised this year on his property in this city. Every almond was plump and the flavor was excellent. He said the trees, of which he has about 20, had not been cultivated for two years, neither had they been pruned. Notwithstanding, the trees had produced the last two years a crop averaging over 12 pounds to the tree. "One tree," said Mr. Hemphill, "grows at the corner of the house, and the ground around it is packed as hard as the street; but in the past two years we have picked over 100 pounds of almonds (soft shell) from it."... Sen. Langford tells us he has sold another quarter-section of land in the Langford colony to A. T. Hatch. This makes 640 acres which the Solano fruit-grower has bought on the Langford tract. Mr. Hatch says he will put the entire section into almond trees. He has an orchard in Solano county, from which he sold this year over \$90,000 worth of almonds, and consequently knows what he is doing when he invests in San Joaquin county property.

Santa Barbara.

HORTICULTURAL SOCIETY.—*Independent*: The regular monthly meeting of the Santa Barbara County Horticultural Society was held at Burton Mound the 2d inst. Mr. Cadwell, from the committee on fruits, reported the yield this year very abundant, especially apples and pears, although some varieties of the latter will yield rather a poor crop. He also reported that from his observations fruit in general is free from disease. The walnut and almond crop is abundant and of good quality. Mr. E. Cooper will ship 35 tons this season, and Mr. E. Knapp about 25 tons.

Sonoma.

POTATO DIGGERS.—*Petaluma Argus*, Nov. 19: We saw Louis Vestal going out of town Thursday with a four-horse wagon-load of Chinamen and gunny-sacks. We asked him if white labor was scarce and he replied: "I have been trying my best to get along with white men, but they don't stick, and I have been compelled to come in after these fellows and give them 13½ cents a sack for digging—which is more than I ever paid before. It was either that or let the potatoes rot in the ground! Don't talk to me about being 'ruined with Chinese cheap labor.'" He drove on toward the potato mines apparently happy to think that he would get his crop out at any price. Only a short time ago there were plenty of men around here hunting for work, but they seem to have suddenly disappeared.

Tehama.

ORANGES RIPENING.—*Red Bluff Sentinel*, Nov. 17: There are four orange trees in Chas. R. Mayhew's yard filled with delicious fruit, which is already turning to a bright yellow color. There is also a tree in Mrs. Hearn's yard containing oranges well ripened.

Tulare.

LEMONS AND ORANGES.—*Tulare Register*: Congdon & Spence have some samples of oranges and lemons hanging in their windows, which, although not yet ripe, serve to show what can be done in that line. The tree from which the lemons were taken is 12 years old and 13 inches through the trunk. It will produce this season more than 500 lemons. The orange tree is the same age and heavily laden. A fig tree in the same orchard, 14 years old, is six feet six inches in circumference. These trees grow on John Tuohy's place, east of Tulare, in dry bog soil at the edge of the foothills, and have never had care or irrigation.

TULE RIVER.—The farmers in the Tule river region are busy already. Not a great area of alfalfa will be planted this season, but considerable grain will be sown and quite an addition to the present number of fruit trees will be set out. Among others, R. O. Bailey, who owns the Cramer farm, is putting in 100 acres to wheat and 30 acres to barley. Mrs. E. A. Cramer, who recently purchased the Ford ranch, is putting 160 acres to grain. Roy Bailey is preparing to plant a large olive orchard.

MOUNTAIN APPLES.—*Delta*: H. C. Arnold brought to this office last Monday some splendid samples of the Ben Davis apple grown on his place in the mountains, 15 miles beyond Three Rivers. They are large, highly-colored, and in every way superior to those of the same variety grown in the valley. At the time Mr. Arnold bought his young trees from the nursery, others were secured from the same lot. Some of these were planted in the valley, some in the foothills and the remainder in the mountains. Fruit on all of these is ripe, but the appearance is enough unlike to make them look like different kinds of fruit. Those grown in the valley are pale, those in the foothills better colored, and those produced in the mountains are dark and clean, with thin skin and firm flesh. Apples of this variety grown in the valley will

keep until about the first of April, but the grown by Mr. Arnold last year kept until the last of May. The orchard is within the pine belt.

Ventura.

FLAX.—*Republican*, Nov. 12: The flax crop of Ventura county is yearly increasing, the seed bringing the highest prices. A curious anomaly is the fact that fiber, which is of the very finest quality, is allowed to go to waste.

HONEY.—Amid the rush and bustle of the boom we are apt to overlook the importance of our honey industry. The wild shrubs and flowers with which the mountain and hillsides are covered give a never-failing source of supply for the bees. So far as can be ascertained, there are about 19,500 hives in the county which yield annually 3,200,000 pounds of honey, or enough to load 160 cars.

Siskiyou.

A SCOTT-VALLEY RANCH.—*Red Bluff Cause*: M. J. Frank, who is at present sojourning at Etna, Scott valley, sends this office some mountain potatoes of the Peerless, Late Rose and Utah varieties. A number weigh over four pounds each and measure 16 inches in circumference. He writes as follows concerning them: They were raised in Scott valley, near Etna, on the ranch of the Hon. J. W. McBride, who has shown me a single beet which weighs 27 pounds, carrots weighing seven pounds each and squashes of 150 pounds. He has some superior cattle and horses, and also runs a dairy, making excellent butter. He recently had the misfortune to lose a barn containing 125 tons of hay by fire, but he had the barn replaced by a new one of much larger dimensions.

NEVADA.

AGRICULTURE IN LINCOLN.—From the assessor's report, published in the *Pioche Record*, we make extracts respecting matters in Lincoln county as follows: The agricultural interest is in a fair way of progress, considering the small population. The northern part of the county has a mild climate and the southern part a semi-tropical. There are choice fruits and grapes in this county, inferior to none. Farming at present is unprofitable, as there is no regular home market and no cheap transportation. In some of the valleys, the farmers raise eight tons of potatoes, 20 tons of carrots, 40 to 45 bushels of corn to the acre. Alfalfa hay is cut twice to three times a year in the northern part of the county, and in the southern part five and six times, with an average of one to 1½ tons per cut. Stock-raising is carried on successfully—cattle, horses, sheep and hogs; but then it comes back to the same point, there is no regular home market, and to try to drive them long distances to find a market would be too expensive and chances of heavy loss. There are thousands of acres of land that could be made useful for agricultural and grazing purposes, if the Government would assist in sinking artesian wells or by artificial work extending running creeks on to valleys or sandy flats called deserts. Land inclosed, 10,511 acres; cultivated, 3612 acres; wheat, 398 acres, 9962 bushels; barley, 1040½ acres, 26,012 bushels; oats, 209 acres, 8315 bushels; corn, 302 acres, 7550 bushels; hay, 3342 acres, 6684 tons; cotton, 49 acres, 19,600 pounds; butter, 9800 pounds; cheese, 6000 pounds; wool, 46,800 pounds. Apple trees, 2023; peach trees, 5452; pear trees, 314; plum trees, 1472; cherry trees, 227; apricot trees, 430; fig trees, 245; mulberry trees, 730; almond trees, 3371; grapevines, 32,287.

OREGON.

SPECIMENS.—*Rogue River Courier*: Mr. Geo. Lewis of Applegate brought into our office on Tuesday last a Blood-turnip beet weighing 13 pounds. This is the largest specimen of the kind we have seen.... Mr. T. Murray recently brought into town a sack of potatoes weighing 50 pounds. When counted it was found to be made up of 25 potatoes, the largest weighing five pounds.... Mr. Hyde brought us this week several apples of the Winesap variety which exhibited peculiarities worthy of mention. One had a bunch of well-developed leaves protruding from its blossom end, and the others had two or three blossoms each.

Dues Needed.

[From our last issue.]

Thanksgiving is at hand and we want to be very thankful to all of our subscribers for having renewed and remitted their subscriptions. The long winter evenings are upon us all, and as we are finishing up our evening's work on the paper by writing this item (while the clock strikes ten), we hope every good subscriber who owes us a renewal has just ended a pleasant reading of our last issue, and is saying to his mother or his wife's father (to whom he never dares tell a lie) or to his wife (to whom he never ought to tell a lie) that he is going to remit his subscription to-morrow, and better enjoy the reading of this paper ever afterward.

Christmas, taxes, New Year's and annual settlements are coming right along, and old subscribers and new subscribers are wanted to help us hold up our heads before creditors, and strengthen our hands to do our best work for you in 1888. Please double up things by making yourselves and ourselves happy by early remittances.

(Original)

That Gentle Man From Boston Town.

An Idyl of Oregon.

BY JOAQUIN MILLER.

Two webfoot brothers loved a fair
Young lady, rich and good to see;
And oh, her black abundant hair!
And oh, her wondrous witchery!
Her father kept a cattle-farm,
These brothers kept her safe from harm:

From harm of cattle on the hill;
From thick-necked bulls loud bellowing
The livelong morning, loud and shrill,
And lashing sides like anything!
From roaring bulls that tossed the sand
And pawed the lilies from the land.

There came a third young man. He came
From far and famous Boston town.
He was not handsome, was not "game,"
But he could "cook a goose" as brown
As any man that set foot on
The sunlit shores of Oregon.

This Boston man he taught the school,
Taught gentleness and love away,
Said love and kindness, as a rule,
Would ultimately "make it pay."
He was so gentle, kind, that he
Could make a noun and verb agree.

So when one day the brothers grew
All jealous and did strip to fight,
He gently stood between the two
And meekly told them 'twas not right.

"I have a higher, better plan,"
Outspoke this gentle Boston man.

"My plan is this: Forget this fray
About that lily hand of hers;
Go take your guns and hunt all day
High up yon lofty hill of firs,
And while you hunt, my loving doves,
Why, I will learn which one she loves."

The brothers sat the windy hill,
Their hair shone yellow, like spun gold,
Their rifles crossed their laps, but still
They sat and sighed and shook with cold.
Their hearts lay bleeding far below;
Above them gleamed white peaks of snow.

Their hounds lay couching, slim and neat;
A spotted circle in the grass.
Their valley lay beneath their feet;
They heard the wide-winged eagles pass.
The eagle cleft the clouds above;
Yet what could they but sigh and love?

"If I could die," the elder sighed,
"My dear young brother here might wed."
"Oh, would to heaven I had died!"
The younger sighed with bended head.
Then each looked each full in the face
And each sprang up and stood in place.

"If I could die"—the elder spake,
"Die by your hand, the world would say
'Twas accident—; and for her sake,
Dear brother, be it so, I pray."
"Not that!" the younger nobly said;
Then tossed his gun and turned his head.

And fifty paces back he paced!
And as he paced he drew the ball;
Then sudden stopped and wheeled and faced
His brother to the death and fall!
Two shots rang wild upon the air!
But lo! the two stood harmless there!

The eagle poised high in the air;
Far, far below the bellowing
Of bullocks ceased, and everywhere
Vast silence sat all questioning.
The spotted hounds ran circling round,
Their red, wet noses to the ground.

And now each brother came to know
That each had drawn the deadly ball;
And for that fair girl far below
Had sought in vain to silent fall.
And then the two did gladly "shake"
And thus the elder bravely spake:

"Now let us run right hastily
And tell the kind schoolmaster all!
Yea! yea! and if she choose not me,
But all on you her favors fall,
This valiant scene, till all life ends,
Dear brother, binds us best of friends."

The hounds sped down, a spotted line,
The bulls in tall abundant grass
Shook back their horns from bloom and vine
And trumpeted to see them pass—
They loved so good, they loved so true,
These brothers scarce knew what to do.

They sought the kind schoolmaster out
As swift as sweeps the light of morn—
They could but love, they could not doubt
This man so gentle, "in a horn."
They cried: "Now whose the lily hand—
That lady's of this webfoot land?"

They bowed before that big-nosed man,
That long-nosed man from Boston town;
They talked as only lovers can,
They talked, but he could only frown;
And still they talked and still they plead;
It was as pleading with the dead.

At last this Boston man did speak—
"Her father has a thousand cows,
An hundred bulls, all fat and sleek;
He also had this ample house."
The brothers' eyes stuck out thereat
So far you might have hung your hat.

"I liked the looks of this big house—
My lovely boys, won't you come in?
Her father has a thousand cows,
He also has a heap of tin.
The guirl? Oh yes, the guirl, you see—
The guirl, just neow she married me."

• A B C of Astronomy—No. 4.

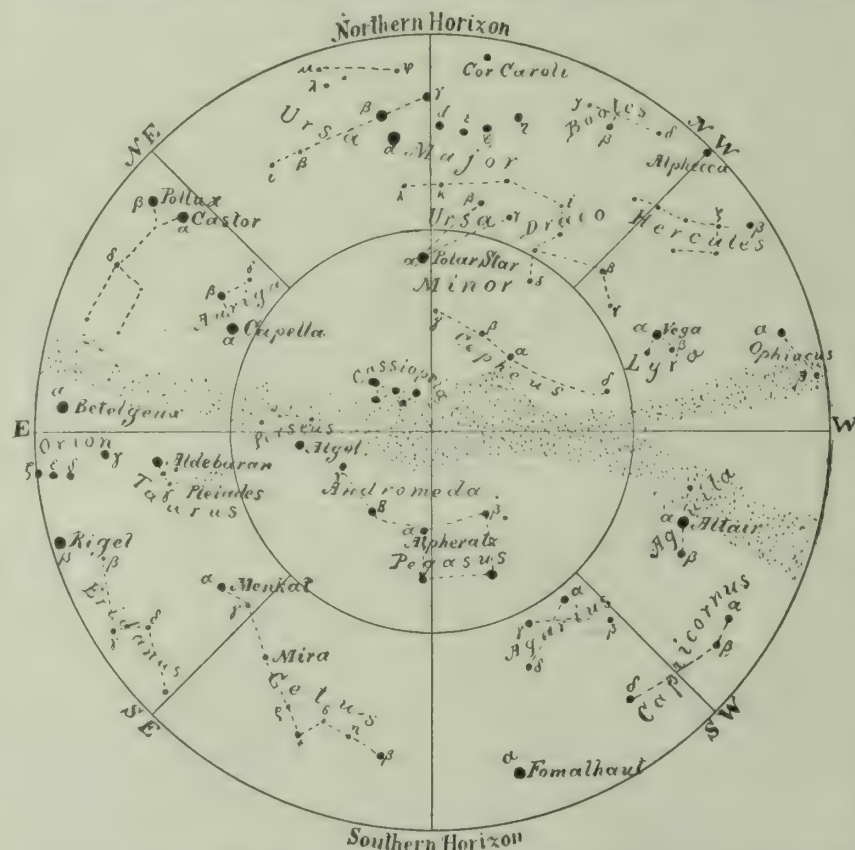

[Written for the RURAL PRESS by ASTRON.]

When Humphrey Davy visited the great astronomer La Place in Paris, and ventured to express the hope that his favorite science, chemistry, would in the near future be brought un-

nearly in contact with the Milky Way or Galaxy—that belt of stars stretching across the sky, which it seems as if nature, in the infinite plentitude of her power, had sifted out and left for humanity to gaze at with wonder and adoration.

Before proceeding further it may be well to make clear a little matter that may have puzzled some of our readers. You are doubtless aware that any given constellation will be seen in the same position in the heavens in one year's time from the date of the observation; or that it will make its appearance say, to-night, four minutes earlier than it did last night. Multiply this four minutes by 365, the number of days in a year, divide this product by 60, and you get the 24 hours, which brings the constellation round again to the same place in the heavens. This is not astronomically exact, but it is near enough for our purpose.

By the assistance of the diagram you have doubtless found The Twins. If you line off from them to a little more than midway between the eastern horizon and the zenith (the point on the sky immediately overhead), you will notice about midway between the two the constellation Auriga with its beautiful star Capella. In our early craze for astronomy it was called the "Twinkler," and we hailed its annual return in the evening as the visit of an old and

[To use the diagram understandingly, consider it to represent the vault of the sky, not a flat surface; and look up at it, instead of down upon it. (The center of the circle represents the zenith, or point directly overhead.) You may, however, find it more convenient, when looking southward, to hold the diagram upright before you; in looking for stars westward, hold it with the "W" downward; looking northward, hold it upside down; looking eastward, hold it with the "E" down.]

der the dominion of those mathematical laws which he (La Place) so ably expounded, he was surprised at the entrance of Lady La Place, demanding of her lord the key of the tea-caddy. Now, if such a master-mind as Napoleon's favorite philosopher could descend to sub-lunary matters so minute as keeping guard of the tea-caddy, it must not surprise the readers of the RURAL PRESS if their humble "Astron" has been diverted from conversing about the stars of heaven to admire the stars of earth at the Mechanics' Fair here, with its luscious fruits, more tempting than were the apples in Eden's garden to our common mother, and its music more enchanting than the strains evoked by Apollo in his palmy days from his flute or lyre, when he gathered so heterogeneous an audience around him; but we will call a halt and resume our work.

It will be our endeavor to give the prominent constellations visible in November at seasonable hours for observation. Beginning with Ursa Major, the Great Bear or Dipper (see RURAL PRESS of May 28th, page 466, and June 25th, page 563), take a small book, or a shingle, or, better than either, a small triangular piece of board or card, and, holding it by one of its corners, look over one of its edges and line off from the two stars in the bottom of the Dipper as per diagram below.

The line, you will see, strikes very near to the two principal stars in the constellation Gemini or The Twins, Castor and Pollux.

These are said to have been named from C. and P., sons of Leda and Tyndareus, king of Lacedæmon, and were brothers to the fair and frail Helen of Troy. Zeus placed them among the stars on account of their love for each other. Castor is generally rated as a star of the first magnitude and Pollux second. Some few astronomers have reversed that, but we leave that to the reader's own judgment.

The Twins or Gemini is the third constellation in the Zodiac, which we will explain further on. The reader will also notice that the two last stars of this constellation southward, come

valued friend. This constellation is sometimes called the Wagoner or Charioteer.

With your triangular card in hand, line off from ε, the lower end of Cassiopeia,

to Capella; thence southward so as to form an isosceles triangle (that is, a triangle having two equal sides), with Capella at the apex,

and you will strike a beautiful reddish star, Aldebaran, in the head of Taurus, or the Bull, the second constellation in the Zodiac.

Then look around and a little toward the zenith and you cannot miss that beautiful cluster the Pleiades. With a small telescope or good opera-glass the six or seven stars visible to the naked eye become very interesting with their almost innumerable companions. This group figures in classical and biblical literature. The Pleiades have been considered by Maedler as the center of the Sidereal system. In Greek mythology the Pleiades were the seven daughters of Atlas and Pleione. Their history varies with different mythologists, and as we are writing on the A B C of astronomy, not Greek mythology, we had better not go further into it.

The constellation Aquila, or the Eagle, we have next to engage our attention, as it con-

tains a star of the first magnitude, Altair. It is easily found by lining off from Vega across the milky way toward the southwest, and being a conspicuous object, the observer is not likely to be mistaken.

There is another star of the first magnitude—Fomalhaut—to be seen this month quite near to the southern horizon. It is in line with the two stars which form the western side of the square in the constellation Pegasus. This completes the prominent stars of the first magnitude, with their belonging constellations which are visible in our latitude in November, during the early hours of the night.

We shall soon have a rich treat in the appearance of the most noticeable and brilliant constellation of the heavens—Orion, with its wonderful nebula, and dragging after it the Big Dog, with its gem of the sky, Sirius.

A word or two here on refraction, which plays an important part in the science of astronomy.

You may have noticed that the portion of an oar under clear and smooth water appears bent; also, that in a pond or pool the bottom appears shallower than it really is. If you wish to try an experiment, take the basin from your wash-stand and gum to its inner sides and bottom several bits of colored paper. Get your friends to look on from certain positions and count the number of bits visible; then pour clear water into the basin, when some of the bits of paper unseen before will rise to view. This is due to a law of physics that a beam of light travels in a straight line in a uniform medium, but varies according to any alteration in its density or rarity, chemical composition, etc.

In closing this fourth lesson, we are authorized by the editor to invite any reader of these simple attempts to ask "Astron" any question where he has failed to make himself understood.

And now we recommend again the study of this ennobling science. It lifts man above the petty cares of life, and millionaire and poor man can here meet on neutral ground, and both enjoy the beauties and infinities of nature.

Letter-Writing.

[Written for the RURAL PRESS by "NETTIE."]

Among the few good things in which our forefathers excelled us is to be placed the art of letter-writing. When communication between friends was less frequent, and when more attention was devoted to living, people wrote not so much to keep up friendly feelings or for selfish reasons as to receive mutual benefit and learn others' opinions.

Letter-writing is now said to be a lost art, and that this is almost true there is no doubt. To be a good writer takes more practice and time than many persons feel able to spend, but is not more lost than gained by this selfish feeling? Selfish because if we thought we ourselves would derive as much benefit and pleasure from our painstaking as we give, we would not pay so little attention to it.

All like to receive letters, but few take pleasure in writing them. It comes, of course, more natural to some than to others, but all can cultivate the art, and if real desire for improvement be present, experience will make letter-writing almost a pleasure. By corresponding we have more influence than we have by personal contact. The fact of our having cared enough to write certain sentences in itself insures attention, and the words are rendered still more important, and more thought is bestowed on them from their very appearance on paper.

It will not do to commit to paper all we would say in conversation, as many things convey stronger or at least different impressions when read than when heard. The reverse is also true, that many things can be said in correspondence which would hardly do to say in ordinary conversation, and some other things can be more diplomatically expressed by written than by spoken words. Yet, remember, what is written may not be destroyed at once and may some time be construed to mean otherwise than the writer intended.

One thing I notice in my correspondents is that it is hard for most of them to elaborate on any fact or statement, yet in this elaborating or enlarging lies the interest of not only letter-writing, but all forms of writing. It is the life, the all. This is so evident it would seem hardly necessary to speak of, but, nevertheless, not enough is thought about it. I have received letters from regular correspondents which contained material enough to fill a score of octavo pages, but which was dashed up in a careless want-to-get-through-soon-as-I-can style that was positively nauseating. Then after four or five pages of such heavy food the last ounce will be added by asking to be excused for writing such a poor letter, "as you know I am an uninteresting writer, anyway."

I have no patience with you. Drop acting like a reporter of daily news and make your letters more interesting by conversing on subjects which stimulate inquiry and draw out opinions. When relating an incident, be careful not to generalize freely; branch out into details, explain what may not be perfectly understood, and do not be afraid of becoming tedious, as almost no one ever is in this line. One of the most interesting letters I have lately received was from a friend in San Francisco who took a sea voyage last summer up the coast a few miles on a sailing vessel. He had a very uneventful voyage, nothing occurring to specially notice except a long delay and the necessity of finally

being put ashore in a row-boat, but he so expanded it by particularizing, by commenting, by joking, that it made enjoyable reading. A letter received last January was a model in clearness of language, in topics treated, and in length. It would fill about 2½ columns in the RURAL PRESS, and is treasured not only for the worth of it, but also for the beauty of its penmanship. Coming from a minister and professor well known as a writer and teacher, it is, perhaps, exceptional in its worth, but what that gentleman did—and that letter was but one of many, and I was but one of his correspondents—can be done in a great measure by seven out of ten who write.

Never fail to read over your letters just before closing. Neglect of this precaution, unless you find from experience that you never have to correct anything, is invariably plain, and to permit a mistake to exist is almost an insult. It betrays inexcusable carelessness. Of course I am speaking of letters between friends, who are supposed to have time enough to avoid making such blunders as a business man may in the rush of business sometimes do, although business letters are supposed to be read before being sent.

A word about handwriting. No doubt the systems used by professionals and taught in business colleges are, in their way, pleasing to the eye, but for myself I much prefer to see the small quirks and turns that we naturally fall into the habit of making when not "taking pains." Each person who does not use the copy-book as a model finds himself giving peculiar turns to the pen and adopting in various ways original trifling fashions of shaping letters, crossing t's, etc., that to my mind make a letter interesting in themselves. But oh! never, as you hope to have your letters read, never allow your hand to write such caricatures of letters that your friends have difficulty in deciphering them. Be original. If you do not like things and can find good reasons for changing, then change, but be sure not to be so strongly individual that only yourself can read your writing!

Haywards, Cal.

YOUNG FOLKS' COLUMN.

Babes in the Wood.

[Written for the RURAL PRESS by AUNT SUSIE.]

"Please, mamma, may we go in the woods and have some lunch in the little basket? Oh! do say yes, mamma; it is such a nice day to be out in the woods."

This was eagerly asked by one of three little boys, who were spending their summer vacation in the country on a fruit farm, where there are also lovely woods, with great tall redwood trees, towering up a hundred feet, and even more, toward the blue sky and God who made them, and here and there a madrona tree grows, with its bark peeling off in its own peculiar way, leaving the tree bright red and as smooth as satin; now and then the bark clings in flakes of pale yellow. Close by we find the beautiful bay tree, with its long, pointed, fragrant leaves, and all about such lovely ferns. Beyond the woods is a mountain very steep and rugged.

These woods were a great temptation to the boys. Stuart was so anxious to go, and Herbert and Romney came running in and added their pleading to his.

Their mamma decided that they could go, but said: "It is too warm for you to walk all the way, so you had better take Old John." He was a steady old horse who had done his share of work, and the children were allowed to ride him about the ranch.

At this the boys clapped their hands and shouted, "Oh! that's fine! We can have Old John and take turns riding."

So their mamma put up some lunch for them. She knew boys have a way of getting hungry, whether walking or riding. They kissed her good-by and started off in merry glee.

Old John looked at them with his gentle eyes, as much as to say, "Do you really think this is fun, boys? I had much rather lie down under a big oak tree in the pasture and take a nap until dinner-time." But nevertheless, he went along in his careful way, and as their mamma watched them go down the hill, she caught a glimpse of a hat waved in the air, heard the sound of their last "Good-by, mamma," shouted with the full force of sound lungs, and the echo across the hills caught it, and back it came to her, as she turned away with a glad heart to see her dear boys so happy, and went about her morning duties.

The hours passed without her realizing how long they had been gone, and they did not know how long it was, either. They went to the woods, and, after running about awhile, decided to eat their lunch, and then went up to a spring to get a drink of the clear, cold, sparkling water. They caught it in their tin cup as it trickled down over the rocks and passed through a bed of green ferns that left it clear and cold.

Just as they finished drinking, Stuart said: "Say, boys, let's climb the mountain. I don't think it looks so very steep. We can take turns on Old John."

"All right," answered the others; "but what if Old John can't climb?"

"Oh, I guess he can," said Stuart. So the others got on the horse, and he trudged along beside them.

Old John picked his way very carefully over

the stones and through the brush. After awhile Stuart was so tired the boys got down and he took his turn on Old John, and so they pushed on and up.

At last they reached the top of the mountain. It was very nice to be so high up. They could see the broad Pacific sparkling in the sun. They were tired, but didn't mind, and thought it was fun. Somehow little boys can do so much for fun and play, but get tired very quick when it comes to working. I wonder why it is.

Well, by this time it was after 12, and their mamma began to feel uneasy because they didn't come home; but grandpa said:

"I expect they have found a nice, cool place under a tree, and, being tired, have fallen asleep. They will be home in a little while."

But alas! they were anything but asleep. They now became tired looking about, and watching Old John eat grass and leaves, and all at once found they were very hungry, and tried to find the path they had gone up by, but couldn't find it. They hunted and hunted, and as they looked down the mountain, it seemed so much steeper than when they went up in the fresh morning air, with light hearts. It seemed to them so steep that if they tried to go they would just fall over and roll down and down over the stones, and they didn't like the thought of that. In a little while more they lost all their courage and sat down and cried; then, as they became more and more lonesome and afraid, their cries became screams. At last they were worn out, and so were forced to be quiet for a time.

Old John kept eating in a most contented way. It did not matter to him now whether he was on the mountain or in the pasture, for he found plenty to eat. After a time the sun went down, and it began to grow dark; then the boys broke out crying again. Old John looked at them as if to say: "What is the matter? I'm going to lie down under this big tree. There are lots of dry leaves, and I shall have a nice bed." So he lay down, and stretched out his legs, and made himself very comfortable.

The boys came to the conclusion they would have to stay in the woods all night, so when they had exhausted themselves a second time with crying and shouting, were so sleepy they couldn't keep their eyes open; so they lay down between Old John's legs, and put their aching heads against his body, and pushed their feet down in the warm leaves.

All at once Herbert called out, "Boys, we must say our prayers;" so they got down on their knees, folded their dirty little hands, and with trembling lips said, "Now I lay me." It seemed to comfort them, and telling Romney to lie in the middle because he was the smallest, they nestled up close together and were soon sound asleep, worn out with their long tramp and crying.

Old John, too, fell asleep, unheeding the weight of their heads, which by degrees slipped down to the ground, they were so tired. They tossed about, and each turn made a few more leaves fly up and fall down over them; so they were well covered from the night air.

Well, all this time their mamma had been very sad. Grandpa went away right after dinner, never doubting the boys would be home in a little while.

Just as the big moon came up from behind the very mountain where the boys lay asleep, grandpa and the men drove in the yard. When they found the boys had not come home, they all started out to hunt for them. The moon was so bright they did not need any lanterns. They hunted all through the woods, and then grandpa said, "They must have tried to climb the mountain, and lost their way;" so they all started up, following the trail, but no boys could be found.

At last they reached the top and began to hunt about. All at once they found Old John, lying under the tree fast asleep, but the boys were so covered with leaves they didn't see them. Grandpa was very tired, and said he must rest; while the other men looked about still more; so he sat down by Old John's feet. In a moment something moved under him; he felt about and found a little foot. He started up and called the men. They pushed the leaves away, and much to their delight found the three boys, but they were so sound asleep it was hard to wake them.

At last they opened their eyes and were very glad to see grandpa's kind face. The men each took a tired, sleepy boy in their arms and were soon down the mountain—Old John following, as they had roused him up after finding the boys. At the edge of the woods they found the horses where they had tied them and were soon home.

Mamma took her boys upstairs and put them to bed without a word of reproach; her heart was too full for words other than of thankfulness.

In the morning the boys came to her and Stuart said: "Mamma, we boys have been talking over getting lost yesterday. It was awful, mamma, and we were so tired and scared; but we think now it was very naughty of us to go up the mountain alone, and we know we made you feel bad, 'cause you cried when we came home, and we feel very sorry. Will you forgive us, mamma?"

"Yes, my dear boys," she replied; and then they told her all about it, and promised not to wander away again, and they kept their promise. They still had nice rides on Old John, but did not go far away.

One day, after Romney had been riding a good deal, he came to his mamma and said: "I think there is something the matter with

my spine." She was quite startled, and undressed him to see what could be the matter. She had to laugh when she found two big blisters, not exactly on his spine.

He said: "Now, mamma, if you had them you would not laugh, for they hurt awful bad!" She put salve on them and in a day or two they were all well.

One night Old John did not come home from the pasture. The next day the boys went to look for him, and much to their sorrow, found him under a tree cold and dead.

They ran crying to the house. Grandpa comforted them by saying: "Well, boys, I am sorry about Old John because you loved him, and enjoyed riding on him, but he has done good service, and is very old, and I really think we ought to be glad, for he might have been real sick, as he was once, and you wouldn't want him to suffer."

"Oh, no!" said the boys, "but we wish he could have lived and been well. We shan't forget that he helped you to find us when we were lost in the woods on the mountain, and covered with leaves, real 'Babes in the Wood.'"

GOOD HEALTH.

Diphtheria.

EDITORS PRESS:—In answer to "Constant Reader," San Jose, as to a cure for diphtheria, I remember reading an article on the subject in the German *Zeitung* some years ago. The writer, a physician, stated that after long years of practice he found nothing equal to the flour of sulphur for this dread disease.

Get a quill or any small tube and fill with sulphur. Let the patient open his mouth and the attendant blow the contents of the quill into the throat; repeat every two or three hours. It was stated that the sulphur destroyed all the germs of the disease, and prevented the formation of the fatal false membrane. N. J. CLARK.

Butte City, Nov. 14, 1887.

[Mr. Charles Reimers also writes us that the inventor of the mode of treating diphtheria which our correspondent asked about in the RURAL of the 12th inst. is Dr. Weber of San Jose, who lives at Second and Santa Clara streets.—EDS. PRESS.]

Canned Goods.

The *Grocer's Chronicle* insists that the fact that canned goods are cooked goods cannot be too widely known or carefully remembered by users. They are not put up in vessels from which they are to be eaten when convenient to consumers, but are only packed in tins in order to preserve them. No canned goods are guaranteed to keep fresh and remain sound for any number of days after being opened. When opened the contents of the tin should be immediately turned out and eaten as soon as possible. If the food must be kept at all, cover it up and keep in a cool place—always, however, turn out of the original tin. The liquor round lobsters, salmon and all vegetables, excepting tomatoes, it is desirable to strain off and throw away. Lobsters and prawns are improved by being turned out into a sieve and rinsed with clean, cold water. Never on any account add vinegar, sauce or any kind of condiment to tinned foods while they are in the tins, and never leave such mixtures to remain an hour or two, if from forgetfulness it is done.

All tinned goods are put up as fresh as it is possible to be, but unless corned or salted will not keep turned out as freshly cooked goods will, and certainly not longer, as many thoughtlessly suppose or expect they will. Sardines, if preserved in good oil, and if of good quality, will be an exception; as long as the oil is good the fish can be kept in the tins, but seven days is long enough to trust these before eating. Consumers should not buy larger packages of canned goods than they can consume quickly; if they should, most of the fish and meats can be potted after re-cooking, sauces and seasoning being used. If the nose and eyes are properly used, it is as impossible to partake of an unsound tin of canned food of any kind as to partake of bad meat, fish or vegetables from a shop.

LEAD MECHANICALLY MIXED WITH WATER. It has been proven beyond all doubt that waters which circulate or stand in leaden pipes or vessels not only take up particles of lead through mechanical action due to friction, but attack the metal, the result being generally lead carbonate. Minute quantities of lead introduced into, and accumulating in, the system must rank among the causes of anæmia and defective nutrition in large towns.

SUPERFLUOUS HAIR.—The removal of superfluous hair from the skin is possible both by means of depilatories and by electricity. The former are mostly preparations of sulphide of barium or sulphide of calcium, and the process by electricity is very slow, each hair root having to be killed separately.

HEALTHFULNESS OF OYSTERS.—A wealthy New York physician declares it as his belief that "the oyster is the most healthful article of food known to man."

DOMESTIC ECONOMY.

Curing Hams and Bacon.

EDITORS PRESS:—In answer to a request from one of your readers, I will describe an English method of curing hams and bacon. The hog is cut as is shown in the diagram.

The shoulder No. 1 is cut as shown. The ham No. 2 is cut through the bone a short distance from hip joint, and this piece of bone is left in the meat. The small piece No. 3 is kept for boiling and is salted; so is No. 7. Nos. 4, 5 and 6 are roasting pieces, eaten fresh, or the ribs are taken out and the whole, including No. 8, may be cured for bacon. Nos. 4, 5 and 6, if you like, may be salted for frying wet out of the pickle; then No. 8 makes the best of breakfast bacon.

Split the head down the face and save for salting and smoking. Boil the rest of the head with the ears and feet and trimmings of the hams and make head cheese.

The next process is the salting. Use an oblong box of 1½-inch pine, of suitable size, or a pork barrel; but the hams and bacon require a tray or box. Rub the hams and bacon with the following salt mixture well before putting it in pickle: Half a pound saltpeter pulverized very fine divided equally—half for two hams and half for two sides. The saltpeter is to be well rubbed into the meat on the flesh sides. The meat is then laid on a bench, skin down, for 12 hours.

Take seven pounds salt and 1½ pounds brown sugar, well mixed, and heated in a frypan, and rubbed while hot upon the two sides of the meat. The meat is then put in the tray and the brine begins to form. Rub and baste the meat every other day (putting the bottom pieces on top) for four weeks, when the meat is hung up to dry, and then smoked.

For the hams, use four pounds salt, 1½ pounds sugar and treat in the same way. The hams should be in the pickle five weeks. This curing is quite important. The meat is not smoked until quite dry, and the salt crystallized upon the surface.

Use for smoking damp wheat straw, corn-cobs or small brush. Smoke a little every day until completely dry, and produce no heat in smoking. Some smoke for two and three months; but when perfectly dry, less time is sufficient.

Procure from your druggist one pint of pyroligneous acid (the acid from an oak tree) and paint your meat with a shaving brush thoroughly with this acid, and hang your meat in as cool a place as you have in this climate, and it will keep sound and be as good as any meat cured in Old England as long as you live—if you are an old man.

The Westphalia hams are made as follows: Well rubbed with dry salt and left to drain 24 hours. Take two quarts of salt; two quarts of bag (rock?) salt; three pounds of brown sugar; one pound saltpeter; four ounces sal-prunelle and four ounces juniper berries, well mixed and boiled in six quarts water. The brine is then cooled and skimmed. The hams are taken from the salt and wiped dry, and the cold pickle poured over them and rubbed in. There should be enough brine to cover the meat. Turn the meat every second day for three weeks, then take them out, wipe dry, and a mixture of ground pepper, salt and bran is thoroughly rubbed in, filling all cracks and openings. They are then smoked a little every day for three months or more, until completely dry, when they will keep and improve in flavor for years. Pyroligneous acid will keep off flies and animalculæ of all kinds and improve the flavor of the meat. ELKHORN RANCH.

Vaca Valley.

NEW MODE OF WASHING.—The ill effects of soda on linen have given rise to a new method of washing, which has been extensively adopted in Germany and introduced into Belgium. The operation consists in dissolving two pounds of soap in about three gallons of water as hot as the hand can bear, and adding to this one tablespoonful of turpentine and three of liquid ammonia. The mixture must then be well stirred, and the linen steeped in it for two or three hours, taking care to cover up the vessel containing them as nearly hermetically as possible. The clothes are afterward washed out and rinsed in the usual way. The soap and water may be reheated and used a second time, but in that case half a tablespoonful of turpentine and a tablespoonful of ammonia must be added. The process is said to cause a great economy of time, labor and fuel. The linen scarcely suffers at all, as there is little necessity for rubbing, and its cleanliness and color are perfect. The ammonia and turpentine, although their detergent action is great, have no injurious effect upon the linen, and while the former evaporates immediately, the smell of the latter is said to disappear entirely during the drying of the clothes.

The Week.

The RURAL greets its readers one day ahead of time this week, that our large force may have an opportunity to enjoy the recreations and reunions of the welcome Thanksgiving holiday. This early printing may bring us into converse with some of our readers before the festivities of the day are over, and to all such we would add a final word to assure all of our earnest participation with them in the rejoicings peculiar to the day, and our wish that few may find life's trials so severe that much joy may not remain to awaken the spirit of thankfulness.

The clouds are thick as we write, and it is to be hoped that Thanksgiving may bring its own special occasion in the real beginning of the rainy season. People have kept courage well, and have drawn all the comfort which the wet winter signs of the oldest inhabitants could bring forward. Still there have been hardships in the delay, as we have already stated. We need now, to revive all hearts and hopes, ground fit to start the plows and verdure to refresh the stock, which has had an unusually long period of dry feeding. We hope this blessing is at hand.

MR. SPRECKELS AT SALINAS.—Mr. Spreckels held a beet-sugar meeting at Salinas last week. A telegram says Mr. Spreckels said he would invest \$150,000 in a beet-sugar enterprise there if others would put in the same amount.

Interstate Commerce.

This bill, as passed by Congress, has two radical defects:

1st, that it ignores the right of each State to regulate freights and fares within its own lines.
2d, that it operates as a bar to the reduction of rates in certain cases.

The first is a most important consideration to every farmer and to every citizen. The just rights of the States should never be ignored or usurped. We should be reminded all the time of these rights, and never ask Congress for a single thing that the State could, should and might do. It makes a bad precedent which will some day work serious mischief.

Railways, highways, all ways within the lines of a State, all except navigable water open to the sea, are under the control of the State. There is nothing in the Federal Constitution to convey them away. It is no matter from what source their charters, franchises or incorporation may come, whether from Washington or Kentucky, the State is sovereign on its own soil and must control. The General Government may demand that Interstate Commerce shall pass through the State on as reasonable terms as our own. Herein, the provinces of the two are strictly defined and kept apart. We fix the rates within the State, and Congress declares that they shall not be advanced on goods passing through from other States. We hold as to the second, that it is impolitic and injurious to the public to make any law to prevent the reduction of rates at any time. Railroad companies should always be free to reduce rates at their pleasure, so long as there is no element of injurious discrimination in so doing. All persons, corporations included, should at all times be free to do good, and restrained only when they tend to evil. Let us explain ourselves.

Suppose we have a law that three cents a mile shall be the highest rate charged for railroad travel. But on a certain line there is a great excess of travel in one direction. Cars come empty the other way, of course. Now the company would gladly accept two cents a mile in these empty cars, and does so. There being no discrimination, but the saving open to all, it should be allowed. Suppose that three cents a mile be the fare on lines running from here to New York and on all intermediate places, yet if the companies, for any good reason whatever, should find it desirable to make the through fare only two cents a mile, they should be free to do so, just so long as there is no respect of persons.

The long and short-haul clause seems to forbid this. It would seem to compel the reduction of the short haul, or the maintenance of the long haul up to the same rate. It is against public policy, and in derogation of trade.

We can easily suppose a railroad from a town on the seashore, with a steep grade into timbered mountains. Lumber in every shape comes down the grade in long trains, and the cars return empty. The company might be willing to take freight or passengers almost for nothing in those cars. Let them do so. No one can be injured, but all must be benefited, so long as all may enjoy the privilege.

It is not the low fare or freight that is objectionable, but the invidious and injurious partiality to persons and places that may be shown.

The farmer, as a general thing, asks no favors, nothing that is wrong or unreasonable, and is always the sufferer when crooked methods are introduced into business.

RAISIN TRAINS.—The second full train of raisins left Fresno Monday. It was sent by George W. Meade & Co., and consisted of 25 cars destined for New York. This makes 45 cars shipped within five days, with another train of 15 or 20 cars for Chicago to follow in a few days.

LIGHT CRIMINAL BUSINESS.—Justice Elgin of St. Helena reported his bills against Napa county, for criminal business, for the months of June and July last, at \$1.50.

Cactus Fodder.

If our friends who are advocating cactus hedges do not use up all the plants in existence, it may be well to have some local experiments on the value of cactus as an element in the ration for feeding stock. We confess we do not enter upon this theme with any great amount of enthusiasm or confidence, and yet in a country where the tunya cactus or prickly pear flourishes over a vast area from north to south of the State, we should be derelict in our duty if we did not present the news which is going around on the subject.

It seems that the fleshy leaves of the plant have been analyzed at the New York Agricultural Experiment Station, and Professor E. W. Stewart gives in the *Country Gentleman* the statement that the cactus pulp compares favorably in some respects with fodder beets, and is better than pumpkin. The analysis of the dry substance of the leaves, which is nearly all of the plant fed, gives the following:

Ash.....	22.79
Albuminoids.....	6.81
Crude fiber.....	14.99
Other carbohydrates.....	52.92
Fat (other extract).....	2.49
Total.....	100.00

The most notable thing shown is the very large proportion of ash. When this analysis is

GROWTH OF THE TUNYA CACTUS IN CALIFORNIA.

figured with the probable proportion of water in the succulent plant (say 88 per cent) we have the following:

		Probably Digestible.
Water.....	88.00
Ash.....	2.73
Albuminoids.....	0.82	0.65
Crude fiber.....	1.80
Other carbohydrates.....	6.35	6.30
Fat.....	0.30	0.20
Total.....	100.00	7.15

Nutritive ratio, 1 to 10.4, or similar to green corn fodder. The station also made an analysis of the ash, which contained the following:

Phosphoric acid.....	1.10
Potash.....	13.88
Soda.....	10.56
Lime.....	37.28
Magnesia.....	4.21
(By diff.) sand and silica.....	32.98
Total.....	100.00

The ash analysis shows that the cactus contains a considerable proportion of phosphate of lime, potash, soda and magnesia to grow or replace the waste of bone. Its greatest defect as a feeding material is its surplus water, but this is not probably greater than in the turnip, pumpkin, etc. One hundred pounds of this plant would give only 10 to 12 pounds of dry food, but its water might take the place of other water for the cattle.

This statement might indicate that a man could both water and feed his stock from the plant, which would be something of a bonanza in a dry country. There is, however, a point which we should be rather anxious about, and that is the contact of the spines with the interior animal economy. Prof. Stewart provides for that in this way:

The prickles or sharp spines on this plant are objectionable, unless crushed between rollers, and such a crusher and cutter would very decidedly reduce the labor of feeding. For, to

get the full advantage of the other food given in the ration with the leaves of the cactus, it should be well mixed with them, and this could be very easily done after they were crushed and cut, falling as pulp into a large vat, when the other food could be evenly mixed with it, the moisture in the plant being sufficient without any additional water. And after these spines were crushed, the cattle could eat it as well as hay.

We have serious doubt about disposing of these spines by roller crushing, such as might suit for the pulping of the fiber. However, we never tried to treat the stuff, and are willing to be convinced. We should like to hear from any of our readers who have conclusions drawn from a better knowledge of the cactus than we have. It is also quite likely that there are local observations of practical tests of the cactus for stock food which can be furnished for publication. A dry year like that of 1877 must have put cattle-feeders to the test of everything green.

But Prof. Stewart thinks the cactus needs some bolstering up to be considered a perfect cattle food, and he makes the following suggestions:

If raw cottonseed is easily and cheaply obtained there, which may be presumed, then let us make up a ration of cactus, cottonseed, cornmeal and mill feed or bran. The cottonseed should be ground or boiled. I will give an analyzed formula, so that its proportion can be better understood.

	Albuminoids, lbs.	Carbohydrates, lbs.	Fat, lbs.
100 lbs. crushed cactus.....	0.65	6.30	0.20
6 lbs. ground cottonseed.....	1.02	0.87	1.62
4 lbs. cornmeal.....	0.34	2.42	0.19
4 lbs. wheat bran.....	0.40	2.00	0.12
Total.....	2.41	11.59	2.13

This has a nutritive ratio of 1 to 7. This should be a successful cattle ration. But if any cheaper, then to 100 lbs. of cactus add 6 lbs. cornmeal and 8 lbs. of bran. This will be a ratio of 1 to 8, but still will be a successful ration. These ratios are given to show the proportion rather than the precise amount to be fed. If mill feed is cheaper than cornmeal, then use 6 lbs. ground cottonseed and 8 lbs. of bran with the cactus. First-class beets may be fattened upon either of these combinations. The ground feed should be mixed together first, and then mixed with the crushed cactus.

If the cactus is to be enrolled as a fodder plant, we wish to rejoice our readers with an idea of the extent of its possibilities, and this can perhaps be best done with a little engraving, showing how the plant grows in this State—not alone in the southern part, for the engraving is from a photograph of a plant growing in Yuba county. Judging from the height of the man who is leaning against it, the plant must be about 30 feet high, and an ax will be needed to harvest its foliage. The subject is open for comment.

FRUIT SHIPPING.—All in the fruit interest should read the important contribution to knowledge of our fruit-shipping problem conveyed in the essay by Capt. Weinstock on page 428 of this issue. This essay was read at the Santa Rosa Fruit-Growers' Convention, and was received with marked attention. It shows clearly in what direction changes are imperatively needed to facilitate shipment and to place the business upon a good basis. The matter should be discussed in all local horticultural societies and influence amassed to secure the reforms which are necessary. This year's experience has apparently shown conclusively the advantages in the auction system of sale; now it is essential that the fruit shall be placed under the auctioneer's hammer without delay, and with reasonable freight charges.

STATE HORTICULTURAL SOCIETY.—The next meeting will be held Friday, Nov. 25th, at one o'clock P. M., in the rooms of the State Board of Horticulture, No. 220 Sutter street, S. F. The subject will be "California Seedling Fruits," and all are invited to bring forward information on the subject. The secretary desires to make up a collection of California-grown Japanese persimmons to send H. E. Van Deman, U. S. Pomologist at Washington. Please bring to the meeting specimens of all the varieties you have.

THE AMERICAN PUBLIC HEALTH ASSOCIATION held its 15th annual meeting in Memphis, Tenn., the second week of November. The attendance was large, representing most of the States as well as Canada, and numerous interesting papers were read and discussed.

Rev. Charles Dana Barrows, D. D.

The subject of this sketch, though still a young man, is a conspicuous figure in San Francisco, and one of the most distinguished clergymen of the city. He is in many respects a typical American—a thoroughbred New Englander by birth, and a man of broad and liberal views and of progressive and cosmopolitan character.

He was born April 21, 1847, in the town of Fryeburg, Maine. When Henry Ward Beecher was asked by a young man how to make a good start in life, he neatly replied: "By first selecting the right sort of parents." Mr. Barrows was fortunate in this matter. His mother, Annie Kimball Dana, was rarely gifted and noted in the literary circles of New England, and it is not strange that her son Charles, at a very early age, should evince a decided taste for literature. He entered Dartmouth college at the age of 14, and soon attracted attention in the classes and halls of debate. Soon after graduating, he became assistant of the High school of Portland, Maine. But the good people of his native town of Fryeburg had their eye upon him, claimed a sort of tutelary interest in him and offered him superior financial inducements in the principalship of Fryeburg academy, his earliest educational home. This appointment placed him in the front of New England educators. While at the head of this academy, which lasted for two years, he won the heart of and married Miss Marion Merrill, daughter of Rev. S. H. Merrill of Portland, Maine, a lady of fine accomplishments and great excellencies of character. Three sons and a daughter are the fruit of this union. During the second year of his principalship of the aforesaid academy, he became deeply interested in spiritual matters and made a profession of religion. This changed the whole course of his life. He had been preparing for the law, in which he would undoubtedly have been a brilliant success. In the fall of 1868 he entered the Andover Theological Seminary, and no one among the seminary students was in more demand in the small churches supplied by this school of the prophets. After his second year at Andover, Kirk-street church of Lowell, Mass., a very wealthy and influential society, gave him a call, but however flattering, Mr. Barrows was not willing to leave the theological school till he had completed his course of instruction. Accordingly that church waited over 12 months for the young student, who then entered on a successful pastorate of 10 years.

At the memorable meeting of the American Board of Commissioners for Foreign Missions, held in Lowell in 1880, Mr. Barrows was appointed by the Prudential Committee of the Board, Chairman of the Committee of Arrangements, and the success of that gathering is largely due to his wise and vigorous plans and efforts. In aiding to secure the Wentworth Fund for Dartmouth College, and other donations, he was conspicuously efficient. His merits were recognized by his *alma mater* in the bestowal of the degree of Doctor of Divinity in the year 1883—one of the youngest graduates of Dartmouth that ever received that honor. He was an influential delegate in the famous Congregational Council, at Brooklyn, New York, in the time of the Beecher controversy. He was one of the nominating committee of seven appointed at St. Louis in November, 1880, to designate 25 learned and judicious clergymen to formulate a new creed of the Congregational denomination.

It is about eight years since he consented to break up the pleasant companionships of the East and take the pastorate of the First Congregational church of San Francisco. The pastorate has been eminently successful, the membership has nearly doubled, the congregation the largest in the city, and the receipts of the society greatly exceed the expenditures. The church edifice is one of the most costly and imposing in San Francisco. As a theologian, Dr. Barrows stands at the front of the liberal movement in orthodox circles of thought, and his congregation fully shares the inspiration of the feeling, as is evidenced by kindly tendering their lecture-room to the uses of the Unitarian Sunday-school during the

building of their new church. Dr. Barrows owned a controlling interest in the *Overland Monthly* for three years, and then arranged for it to go into the hands of a stock company.

His speech at the great Sargent dinner, when the Hon. A. A. Sargent was appointed Minister to Germany, was spoken of by individuals and by the press in the highest terms. As a member of Boards of Trustees of several educational institutions, among them being those of Mills College and Fryeburg Academy, he is wise in counsel and painstaking in his duties. His musical ability has proved of great advantage in his work, it being of high quality. He is greatly beloved by his people and in the great missionary work of the State as pastor

REV. CHAS. DANA BARROWS, D. D.

of the oldest and wealthiest Congregational church in the State, and, as a loved brother among his ministerial brethren, he exerts a leading and helpful influence, being always ready to further plans which will strengthen and relieve the poor and build up the best interests of California. His church nobly seconds all his efforts. As we have said, Dr. Barrows is still young, having hardly yet reached the full maturity of his powers. But he has already accomplished much. Educational institutions from kindergarten to college have felt his beneficent influence, and the charities and churches he has aided have been not a few. His public lectures are inspiring. His addresses are many and instructive. It may reasonably be expected that the greatest achievements of his life are yet in the future, a rich fruitage from the choice culture, the high resolves and the earnest discipline of the past.

"We live in deeds, not years; in actions, not in figures on a dial; he most lives Who thinks the most, feels the noblest, acts the best."

The school-children in Cincinnati now carry bottles of boiled water to drink.

A Great Effort by the Woolmen.

We have received documents from the secretary of the National Wool-Growers' Association, Albert Chapman of Middlebury, Vermont, which show that a strong and well-organized effort will be made before Congress this winter to secure such legislation in the wool interest as is desired by the growers. Hon. Columbus Delano, president of the association, has issued an address in which he announces that the committee appointed by the Ohio wool-growers to ascertain the disposition of the wool-manufacturers toward the effort to restore the tariff of 1867 has discharged its duties, and in doing so has reached the conclusion that the dealers

the National Wool-Growers' Association meet in Washington, on the first Monday in December next, to take into consideration the peril which hangs over the industry, and to consider the best means of correcting existing erroneous rulings of the Treasury Department in regard to the importations of wool and manufactures thereof.

Agriculture and the Geological Survey.

The declaration made by the State Grange concerning the need of carrying on the agricultural work provided for by the law creating the U. S. Geological Survey, is a movement in the right direction. Especially now that actual settlers are disposed to move in such numbers upon the public lands, it is desirable that the agricultural features of the lands should be set forth and classification be made upon them. The earlier surveys under Powell and Hayden did much work in this line, and Prof. Powell's report on the arid lands of the United States is a standard and of great value. When the survey work was reorganized, the classification of public lands was made the leading item of its work. The first report of the Geological Survey alludes to this work and promises a vigorous effort to discharge it. It is hoped now that the execution of the work will not be longer delayed. It is not easy, we acknowledge, to find men competent to prepare such reviews. There are more good geological field men than there are agricultural, and yet probably the latter can be found if provision is made for them by Congress. Though the law calls for the agricultural work, the appropriation bill in specifying the personnel of the survey does not provide for agricultural experts as it should. At the coming session of Congress this matter will probably be prominently brought forward, and the deficiency in the appropriation bill can be supplied. The following is the action taken by our State Grange at its last meeting:

WHEREAS, Agriculture lies at the very foundation of our National prosperity, and is justly entitled to an ample share of the fostering care of the General Government; and

Whereas, In the opinion of this body it is of the highest importance that accurate and reliable information concerning the agricultural features and peculiarities of the country, and particularly of the newer States and Territories yet to be settled, should be within the reach of the intending settler and immigrant; and

Whereas, the law creating the Geological Survey of the public domain of the United States provides for "the classification of the public lands and examination of the geological structure, mineral resources and mineral products of the National domain," but in the actual execution of the work the first provision has thus far remained a dead letter so far as any of the information needed by agriculturists is concerned, while the most elaborate and minute investigation of even the most recondite matters relating to the geological structure and mineral resources have received abundant attention; therefore be it

Resolved, That the State Grange earnestly prays the Honorable, the Senate and House of Representatives, that steps be taken and provision made to the end that the Geological Survey shall discharge the first duty entrusted to it by law, to wit: "The classification of the public lands;" together with such other service to the agricultural development of the country as properly belongs to that effort.

Resolved, That copies hereof be transmitted to the Honorable Representatives of California in Congress, and that their approval and support of such measures as are needed to obtain the result be most earnestly solicited.

There is not, as we understand it, any objection made to the geological work of the survey, which we believe is accepted by experts as excellent. The claim is that while such work is done, the other work in the aid of our leading industries and the industrial development of the country should not be lost sight of. As Prof. Powell is at the head of the survey, and has already rendered the country good service in reference to our arid lands, as we have stated, it is fair to conclude that he will be ready to discharge the other work now asked from his office if Congress should make due provision for it.

LESSENING TIME AND RATES.—Beginning December 1st, the steamers of the Pacific Coast S. S. Co. and the O. R. & N. Co., trading between S. F. and Portland, will not only diminish the time occupied in the passage, but will reduce rates as follows: First-class passage between S. F. and Portland, \$15; round-trip tickets, \$25; steerage-trip tickets, \$7.50.

GOOD LIVE INDIANS.—The Visalia Delta states that among those employed in hauling lumber from the mountains are a few Indians who own the teams they drive and the large wagons used. They are industrious, make their trips regularly and are making money.

Mr. Delano requests all the officers of

FRUIT MARKETING.

Review of Fruit-Shipping of 1887.

[The following paper by Capt. H. Weinstock of Sacramento was read at the Fruit-Growers' Convention at Santa Rosa on Nov. 10, 1887.]

Having been called upon to read an essay before the Fruit Growers' Convention on "Transportation," I deemed it well in treating this question to get Eastern results of this year's fruit business.

With that aim in view, the following letter was sent to a number of fruit men in the large Atlantic cities:

SACRAMENTO, Sept. 27, 1887.

DEAR SIRS:—As the season for California fruits is now nearly over, I should like to get your views concerning the past and present as well as your opinion concerning the future prospects for our green fruits in your market.

I would ask you to point out the mistakes, if any, that have been made in the handling of California fruits during this season, either at your end or ours, and I should like you also to tell us what must be done in order to avoid hereafter any mistakes that may have been made.

Can anything more be done in the way of securing better and cheaper transportation facilities, and, if so, how would you go about it?

Please state the aggregate amount of California fruits handled by you this season, and, if possible, the average price realized per pound. Also, as near as you can estimate, the amount of California fruit received in your market by other parties, and your estimate, as near as possible, of the average price per pound realized by them.

In fact I should like you to give a review of the past season's experience in California fruits in your market, including all the information at your command, together with such hints and suggestions as in your judgment would be of value for our future guidance.

And, finally, I would like you to state whether you consider the auction plan, as applied to California fruits, a success in your market, such as to warrant a continuance of that method of sale for our products.

From among the replies to the foregoing which have been received, I have chosen the following as being of most interest:

From Snow & Co. of Boston.

MR. H. WEINSTOCK, Sacramento, Cal.—Dear Sir: We have this day your esteemed favor of the 27th, and replying so quickly we will not be able to give you an answer to all your questions, but at a later date possibly we may be able to do so.

In the first place, you ask us to point out the mistakes (if any) that have been made in California fruit at either end this season, and also ask our remedy to avoid such mistakes. Second, can anything be done to secure cheaper and better transportation, and how to go about it. Third, regarding present sales and future prospects of California green fruits in our market.

In answer to your first inquiry, we will have to reply in general terms. We do not care to discuss this point in detail as affecting our neighbors or reflecting upon any shippers, but it is our opinion that, for a start, too much fruit was sent here at one time. When you will consider that during your visit here last season you asked the question if we thought two cars a week would be too many, we were not prepared to answer positively, both you and ourselves thinking that possibly two cars per week might be too many, and when you come to consider the fact that on one day six cars were due here, following several cars of a few days previous, and others to come, you will see that the momentum was much stronger than facts warranted.

There is much to be done to make the shipping of California fruits to Eastern markets a success. Intelligence at both ends is a very much-needed quality. Too much care at your end cannot be taken by the packers and shippers, and at this end the best possible judgment must be secured. Parties must be interested in the business and acquainted with it to successfully conduct it, and this will apply to both ends.

As regards securing cheaper and better facilities, we cannot answer you positively, but it seems from our standpoint that something should be done.

Regarding our views concerning the past and present season, and the future prospect of your green fruits in our market and the matter of the auction, the past season has demonstrated that there exists in the East a great demand for California fruit. The output has been very heavy, and the goods have been advertised from the fact that so many came that they had to be sold, and a large trade grew up in consequence of the great quantity. What the result has been financially for the shipper is a matter that can be better determined by you as a director of the California Fruit Union.

We know there have been some ruinously low prices on account of the poor condition of the fruit that was received, and we also know that some very satisfactory profits have been made by the shippers of fruit which has arrived here in good condition.

There is no doubt in our opinion of the success of California fruit in Eastern markets, and the success of the auction system, as viewed in this city, fully meets our most sanguine desires and expectations. We know from actual contact, having sold quite a number of cars ourselves by auction in our own stores, and having them fully under our own management that the shippers have made money, with the exception of the last car, which came to us but a week ago, composed partly of Muscat grapes, which should not have been shipped here and would not have been had our instructions been followed.

All fruits, when getting to the point of deterioration, must be handled without delay, and the only way to successfully do it is to sell them quickly to the highest bidder; also all fruits in fine condition seeking an outlet in large quantities and sought for by buyers, we believe command better prices and more satisfactory results by the auction method. We are fully committed to the auction business and if California fruits can be systematically handled by competent parties knowing the business and interested in the same, we believe the auction system the method of all methods by which to dispose of them.

The experience of shippers from the Union in New York and Boston this season must be against the principles of shipping large quantities of fruit without regard to the wants of the market. The business was an experiment this year, and as such, in our opinion, should have been followed cautiously, and without attempting to do too much the first year, gaining from the experience of this season many facts that would continue the business more successfully the coming season. We do not care to criticize our neighbors either here or in New York. We believe the Union's agent here has done the very best he could. You will understand that when fruit goes into the regular auction-room there is no other resort than to sell it on the spot whether it brings good prices or not.

Should fruit be shipped to this market another season which we trust and hope will be the case, we may be permitted to offer the suggestion that a less number of cars be shipped, or perhaps more evenly

distributed. The market should take two or three cars of California fruit daily, if properly handled at both ends, without creating demoralization on an overstock. Very truly yours,
Snow & Co.
Boston, Oct. 4th.

Harris & Co., Auctioneers of Boston.

Write as follows:

MR. H. WEINSTOCK, Sacramento.—Dear Sir: Your favor of Sept. 27th received and contents noted. Our auction sales of California fruits commenced on the 18th of July, and the first offerings were of pears, peaches and plums. Choice sound Bartlett's were generally in demand at good prices, but, unfortunately, the fruit was too often overripe and only fit for immediate use, consequently the grade who wanted to ship to their out-of-town customers couldn't handle it, and it sold at low prices; but prime Bartlett's laid down here in good order will command good prices up to about the middle of August. Some few lots of pears of other varieties, and particularly the Winter, were received at a time when they were not wanted, and in our judgment it would be best not to send anything but Bartlett's.

Peaches were always in good demand, and choice, sound lots sold readily at full prices until the last few shipments, when the large receipts from Delaware lowered the prices.

Plums and prunes arrived in a more or less waxy condition. Gros prunes, however, were usually in good order and sold quickly and well, some of them being very fine, but care should be used in packing to have fruit as nearly uniform in size as possible; in some boxes it was large and handsome, while in others of the same lot it was small and inferior.

There are always buyers at our sales who want the best that can be had, and are willing to pay well for it.

Grapes—We are satisfied that Muscats can not be sent to this market in large quantities and sold to advantage. All that we have had have been poor and sold at low prices.

Of Tokays we have never had a good lot to offer, but have no doubt that a car of strictly choice grapes would now sell quickly at 10 cents per pound, or 34 cents crate.

A car of 884 packages sold the 3d inst., at 31 cents to 75 cents per half-crate, and 85 cents per crate, but the first was in very waxy condition; owing to an accident it had to be transferred to another car and was five days overdue when it arrived. Had it come through on time with sound fruit, it would have sold at good prices, notwithstanding the market is full of domestic grapes, which are selling at low prices. All that we have received have been wholly inferior to those offered on the market at private sale.

We have handled for the agents of the California Fruit Union about 26,000 packages of fruit, amounting to \$43,290, or six and seventeen one-hundredths cents per pound.

We have means of estimating the amount handled outside of Union or prices of same. We think no serious mistakes have been made at either end of the line. Of course it was understood at the beginning, by all interested, that some time was required in which to learn the business, find out what fruits were wanted, the best time to ship and the proper way to handle and expose fruits for sale, and those things have been learned by the experience of the past three months.

We consider the auction plan, as applied to California fruits, has been a success from the start, not that it has always resulted profitably to the shipper, but it has enabled us to show that large quantities of fruits may be disposed of at a time at good prices, unless they are the kind that are not wanted at any price.

The low prices were due to the poor quality and bad condition and not to any fault in the methods of sale.

We believe a profitable business can be done in this market if the shipper will send only the kind of fruits that are wanted, when they are wanted, and will be careful to pack only that which is in condition to stand the long journey, giving attention to grading and assorting so as to have uniformity in size; and we still feel, as we have always maintained, that the auction plan is the best one by which to market large quantities of California fruit.

Our sales were well attended, and gave general satisfaction to the trade, who were only too glad to be able to buy in this way, and there were many times when the supply of good fruit was not equal to the demand. We think the matter of trying to secure better and cheaper transportation facilities is something that will have to be attended to on your end of the line, but if there is anything we can do here we shall be glad to act.

The agents of the Union have at all times given the business the greatest care and attention, the fruit has been handled in a thoroughly first-class manner, and everything has been done by them and ourselves to make a success, and we sincerely hope the shippers and supporters of the California Fruit Union will not be discouraged at the result of this first season's business, but may be willing to ship next season, and by acting upon suggestions which have been made and valuable information which your agents can give, may be enabled to do a larger and profitable business.

H. HARRIS & CO.
Boston, Oct. 7th.

Powell & Co. of Philadelphia

Write as follows:

DEAR SIR:—Your favor of September 29th received and duly noted. All the fruit we have had from the California Fruit Union sold at an average of a little over 54 cents per pound, but we had to pay so much freight that we did not pay the growers unless they got a rebate from the rate to the companies. But I think the selling at auction is the way to sell this kind of fruit, as I am well satisfied that I got more for it at auction than I could the other way; but this was a very hot season—the warmest we have had for years. I wonder that the fruit kept as well as it did. I can't tell anything about what other parties got for fruit, but of course they got more than we did at auction, for they would not have had 25 to 50 boxes at a time, and that amount would bring more than a carload, but I don't suppose there has been in this market to us and all other parties three cars of fruit, besides the seven cars that we had from the Union.

Philadelphia, Oct. 8th. WM. H. POWELL & CO.

Sgobel & Day of New York

Write as follows:

NEW YORK, October 7, 1887.
DEAR SIR:—We beg to own rec'd of your esteemed favor of the 27th ult., and carefully note all that you tell us. We presume the season for California fruit may be considered as entirely ended, as even the Tokay grapes do not get satisfactory returns when sent by the single carload, as they must be now; therefore we do not expect to receive any more this season, and as we have gained experience, like others, we may consider ourselves in a better position to answer your questions now than we were some time ago.

The mistakes, if we may call them such, that have been made, have been made in California; and the glaring mistake is the sending of common fruit here.

You know well that in the past that this market has been supplied by Dudley, Clapp & Doe almost exclusively.

Mr. Clapp has been stationed in Chicago, has purchased the very cream of the California fruit, and that New Yorkers have never known anything but the most superb quality of fruit from California. Now, we have had some magnificent fruit, too, especially that packed by Messrs. W. R. Strong & Co.; but we tell you we have had a great deal of common fruit. Our people will not pay high prices for this class of fruit. The fact that it is California fruit, or that the boxes are marked "California," has less weight with the actual consumers than some people imagine.

True, a large share of our fruit has come from the growers, who do not know how to pack. Their men mix choice fruit with fairly good fruit, or fairly good fruit with common fruit. At any rate, we have had plenty of common fruit. We tell you that. Now, this costs just as much to get here as the finest quality, and the consequence has been that many of our account sales must have been unsatisfactory.

We have gotten up some statistics, and find that we have received this entire season and sold here the following:

	Pkgs.	Average per lb.
Pears	17,152	5 cts.
Peaches	7,627	5 1/2 cts.
Plums	3,152	9 1/2 cts.
Apricots	4,701	7 1/2 cts.
Grapes	4,574	5 cts.
Nectarines	259	3 1/2 cts.
Quinces	14	10 cts.
Total	37,479	

From this you will see that peaches, pears and grapes have averaged five cents per pound, good and bad, sound and decayed, while apricots and plums did decidedly better.

It is quite impossible for us to tell you, or for anybody here to know, what other people have received in this market; probably about a fourth of what we have received. That is a rough guess, but we have no means of getting at it any closer, and it has all come to D., C. & Co., from Clapp in Chicago, to Salt & Cuneo, from Mr. Reid, either from Chicago or Sacramento, and to Mr. J. H. Cromwell from Earl. We could not possibly tell you what prices these parties have obtained.

Now as to the transportation. Our firm opinion is that you must not rely on \$625, and we must have this brought down.

We want \$400 from Sacramento to New York, and hope the matter will be taken hold of from your end of the line.

The Erie Express only receives \$100 a car, when five cars come from Chicago to New York; consequently the other lines get \$300 from Sacramento to Chicago, which is a high freight under all the circumstances. From Sacramento to Chicago is about 2000 miles, and from Chicago to New York is about 1000 miles; ergo, if the charge is \$100 from Chicago to New York, it ought to be \$200 from you to Chicago. There is no doubt about it, we must have a lower freight than this \$625 business.

Some minor things should be corrected: The delay somewhere on the road when cars so often reach Chicago about evening, several hours after the actual passenger train arrives there, leaving yours a little after our fruit train. The passenger train must pass the fruit train somewhere on the way, and yet we understood that it was guaranteed that the fruit train should keep ahead of the passenger train. There is a screw loose somewhere. If those cars reach Chicago as they should, say about 5 o'clock A. M., they could always catch the 7:45 train over the Erie, and arrive here at such a time that we always could sell at 11:45. This needs investigation.

Now, in conclusion, as to the auction plan. As we wrote to Mr. Blowers yesterday, if we advocated the auction plan strongly when he was here, and before we took hold of California fruit, we advocate it ten times as strongly now. There is no doubt on this point. No commission merchant in New York could begin to handle the fruit we have handled this season, and get any such prices as we have gotten. They simply could not do it. D., C. & D. had a car of Tokays put into the auction room a few days since, and Dudley told me yesterday that while he could sell choice fruit, he could not sell that kind of fruit.

It is immaterial what commission people may tell us, and what other people may say, the fruit must be sold at auction.

It is absolutely impossible for it to be sold in any other way; and if we only had several of your directors here, so that we could show them personally this thing, there never would be any doubt in their minds as to how California fruit ought to be sold. Five cars in a day as we sell it. A large share of it must simply lie over until the next day, or even the day following, and where would apricots, peaches, etc., be under such circumstances?

We cannot put this matter too strongly, and call your attention to the fact that all the Florida people, even, who are hunting around to find some plan by which a part of the crop can be held back from northern markets during the terrible winter weather are forming new plans for auctions, even in Jacksonville.

Of course it is folly, for buyers from the North would not go down to Jacksonville to buy their fruits, but it shows very distinctly that the fruit must go into the auction-room; and the very commission merchants here who receive Florida fruit all acknowledge frankly that the time is not far distant when the entire crop of Florida must be sold at auction.

Maxfield & Co., one of the heaviest commission-houses in Florida oranges, told us a few days since that they intended to auction all of their product next winter, and we hear that others are getting ready to do the same thing.

We tell you in the strongest possible manner that your California fruit must be sold at auction here, and in no other way.
Sgobel & Day.
New York, Oct. 17th.

The Vital Question.

Aside from the question of how to sell our fruits, whether by auction or by private sale, and what fruits to ship and when to ship them, and aside from the question how to increase the Eastern demand, the vital points of interest at this moment are those touched upon in their letter by Sgobel & Day, when they say:

"Our firm opinion is that you must not rely upon \$625 per car, and we must have this brought down. We want \$400 from Sacramento to New York, and hope the matter will be taken hold of from your end of the line. The Erie Express only received \$100 a car, when five cars come from Chicago to New York; consequently the other lines get \$300 from Sacramento to Chicago, which is a high freight under all the circumstances. From Sacramento to Chicago is about 2000 miles, and from Chicago to New York is about 1000 miles, ergo if the charge is \$100 from Chicago to New York, it ought to be \$200 from Sacramento to Chicago. There is no doubt about it, we must have a lower rate than this \$625 business."

The experience of this season has made it very plain that we cannot rely upon \$625 per car to New York. This is a prohibitory rate as far as selling carload lots in the markets of the far East is concerned; \$625 a car means nearly four cents a pound net weight for freight. At this rate how can we ever hope to compete with the grapes from Spain, the freight on which is but one cent per pound? If the Pacific railroads are in earnest when they say that they have the interest of the California fruit-grower at heart, then they must make it more evident by their acts than they thus far have done. It cannot be said that the Eastern railroads are a stumbling-block in the way of low rates. If the Pa-

cific railroads will but give us the same rate charged by the Eastern roads, there will be little left for complaint.

The rate from Chicago to New York in single car lots was \$200 per car. This rate was this season reduced to \$125 per car, a reduction of 37 1/2 cents, whereas the Pacific roads reduced their rate from \$600 per car to Chicago to only \$500, or 16 2/3 per cent, and in train lots while they reduced the number of cars per train they advanced the rate per car just one-third, or from \$300 to \$400 per car.

It is possible that the Pacific railroads may be able to explain these differences in the concessions allowed between the Eastern and Western roads, and to show that they have made their full share of reductions. But to the uninitiated, it seems very plain that the railroads east of Chicago, who frankly tell us that they have little or no interest in our welfare, that our business to them is but as a drop in the bucket and scarcely worthy their notice, are yet liberal enough to give us a reduction of 37 1/2 per cent on former rates in single car lots, and a reduction of one-half of former rates when several cars are forwarded at any one time; whereas the Pacific railroads, who willingly admit that it is to their interest to develop the resources of our State, and who are directly interested in our prosperity, and who have handled more than ten times as many carloads of fruit as were sent east of Chicago, have, in the face of these facts, made a much lesser reduction in rates, and are to-day charging double the rate per mile charged by the roads east of Chicago.

It is true that a \$400-rate was made to Atlantic cities, but the conditions surrounding this rate were such as to place it beyond reach.

In 1886 Boston used on an average about half a carload per week of California fruit, and New York about one carload per week. It was the judgment of the fruitmen of Boston, and especially of Mr. Snow & Co., as stated in his letter, that if the consumption of Boston could be quadrupled and increased to two carloads per week, that for the season of 1887 it would be doing great work.

In the face of these opinions we find that the consumption was increased to an average of over four carloads per week. The shipments to Boston for July, August and September being 39 carloads from the Fruit Union, and about 10 carloads from other sources, and the consumption in New York was increased from one carload per week in 1886 to between five and six carloads in 1887.

This increase might have been more than doubled if the \$400-rate had been made available.

But while wonders were accomplished in increasing the consumption in Atlantic cities from 500 to 800 per cent in one season, it can readily be seen that it is yet impossible to comply with the iron-clad provision laid down by the Pacific railroads, who say that in order to secure the \$400-rate no less than five cars must be sent to any one city.

This could not at present be done east of Chicago under any rate, no matter how low.

It would be ruinous to send a week's supply of highly perishable fruits at any one time. The success of the industry lies in sending daily and not weekly supplies.

Promises not Kept.

What the fruit-growers asked for, and should have been granted, was a \$300 rate to Chicago when 10 cars were started at a time from Sacramento, and a \$400 rate for the one or more cars that would be shipped from such trains beyond Chicago.

The \$300 rate to Chicago in 10-car trains was positively promised the fruit-growers last January by Mr. A. N. Towne, who in the presence of a large committee of fruit-growers said as plainly as language could express it, that a \$300 rate to Chicago would be granted provided the Interstate Commerce Bill did not interfere. The bill, as was afterward shown, did not interfere, and yet that promise was never kept, and the rate, against all the pressure that the growers could bring to bear upon the Pacific railroads, was made \$400 to Chicago. As an apparent concession to the growers the same \$400 rate was fixed for Atlantic cities, provided as already explained that five carloads went to one city. If less than five cars and more than one car was sent beyond Chicago, an additional hundred dollars per car was added by the Pacific railroads. Out of this \$100 extra per car the roads east of Chicago received but \$25 and the Pacific roads retained the remaining \$75 without having rendered any service whatever therefor; as they had already received the full rate of \$400 per car to Chicago, which was all they professed to charge for cars in train loads.

Thus we see the strange anomaly of the roads who should do the most toward enlarging our markets in the East, doing positively the least to further this end—in fact, we see them going so far as to keep from us the advantages in the way of low rates that the roads least interested in us are willing to give. And we see the further anomaly of the Pacific roads placing such conditions in the way as to compel the growers to choose between sending weekly supplies to the Atlantic points in single shipments, which means disaster, or of sending daily supplies at rates that are prohibitory. On the one hand they aid us as much as possible to increase our production, and on the other hand they seriously hamper us in developing our markets.

It is not easy to understand a railroad policy that on the one hand spends millions in build-

ing feeders throughout the State to develop sections adapted to fruit culture, and on the other hand keeps the markets for these very products choked and cramped and limited. If this policy is persisted in it must not alone seriously injure all who are already engaged in fruit culture, but it must result in making the millions now being invested in railroad building far from profitable.

Sgobel & Day write from New York under date of November 2d: "The capacity for receiving fruit was not at all tested by you; some 50 cars came, but 100 could have come just as well as the 50, if you had seen fit to send them."

Had the freight rates and reliable service permitted, it is needless to add that we would most decidedly have seen fit to send them. They further write as follows: "As to New York's capacity for receiving fruit, what do you think of the sales here of Almeria grapes during the past 20 days, i. e., 65,000 barrels? We grant you quite a share of this is sent to different points this side of Chicago, but Boston and Philadelphia also receive these grapes from the other side of the water."

From this it may be seen that we have just begun to tap the vast markets of the Atlantic border, and it now remains for the transportation companies to say whether we shall stop where we are or develop these wonderful markets to their fullest extent.

Ruinous Delays.

Another matter which should receive the attention of the growers, and which is quite as important as low rates, is the question of fast service. A hundred dollars per carload to New York is a high rate, if delays are permitted that brings the fruit to its destination in a rotten condition. The train service from Sacramento to Ogden has, so far as can be learned, been first-class, and the promise made by the Southern Pacific railroad, to keep the fruit trains ahead of passenger trains, has been faithfully observed. But east of Ogden the service has been far from satisfactory.

Out of the 39 cars sent to Boston by the Fruit Union, 16 arrived one day late, three cars two days late and one car four days late.

Out of the 51 cars sent to New York, 17 cars, and possibly a few more, arrived from 5 to 24 hours late, and out of the seven cars sent to Philadelphia five cars arrived late.

Where fruit is sold by auction the delay of five or more hours is often equal to a delay of 24 hours; because, as a rule, the sale must be postponed to the next day.

A delay of 24 hours with such midsummer heat as is found in New York means a depreciation of from 25 to 50 per cent in the value of the fruit and brings a loss where a profit would doubtless have been made. From all that can be learned these delays have been caused chiefly by the Union Pacific road. Every influence should be brought to bear on this road to induce it to remedy this serious evil. The growers have a right to demand first-class service. There is no good reason why the Union Pacific should not render service equal to that of the Southern Pacific. In conclusion I desire to say that the experience of 1887 has made it very plain that we have a boundless market in the far East for our green fruits. As well as we have in one year increased the demand in Boston and New York from one carload to five carloads per week, just so readily can we further increase the demand from five carloads per week to as many carloads per day.

But we cannot hope to bring this about until the transportation companies realize more fully than they now do that it is highly to their interest to make the service to the Atlantic cities equal to first-class passenger time and the rate, in ten-car trains, \$300 to Chicago and \$400 per car for the one or more cars sent beyond that city. To secure these rates, and to secure such first-class service, should be the united aim of all California fruit-shippers and growers, and their efforts should not be relaxed until these changes have been brought about.

H. WEINSTOCK.

Discussion and Action.

The paper of Capt. Weinstock was heard with interest, and discussion followed in which Mr. Hatch, Mr. Buck and others took part. The discussion resulted in a motion that a committee be appointed to act with committees from the State Board of Trade and the California Fruit Union to wait upon the railway managers and claim better and cheaper service for the coming year. The motion was adopted, and President Cooper appointed the following as a committee: James Bettner, Riverside; S. J. Stabler of Oakland and George F. Hooper of Sonoma. This committee will report to the meeting of the stockholders of the Fruit Union in January next.

A RAILROAD MULETED.—At Santa Rosa in the case of Wm. King et al. vs. the N. P. R. R., wherein action was brought to recover \$20,000 damages for injuries received by Mrs. King in alighting from the defendant's cars, which did not stop at the station long enough to allow passengers to alight, the jury last week returned a verdict for the plaintiff in the sum of \$5000.

THE Nipomo News says that a 107-pound beet raised by Mr. A. Forsting on the Los Berros, and shipped to San Diego by Messrs. Beckett and Hardie, was barely four months old.

FERTILIZERS.—Samples of the phosphates advertised in this paper will be mailed free to those desiring them, and applying to H. M. Newhall & Co., 309 Sansome street, S. F.

The Fairs.

San Luis Obispo—16th District.

The inaugural fair of the 16th District Agricultural Association, held at San Luis Obispo October 12th to 15th, proved one of the most brilliant successes of this singularly successful fair season.

The land on which the fair-grounds and track are located had been purchased only a month before, and yet so wisely and efficiently worked President E. W. Steele and Directors L. M. Warden, P. W. Murphy and Geo. Van Gordon—all needful structures were finished in time for the exhibition.

The display of blooded horses and cattle was extensive, and upheld the reputation for fine stock which this county has for some years past been winning, and the parades and races drew to the park throngs of visitors.

For want of a pavilion, the products of the fields and orchards, domestic manufactures and works of art, were marshaled in Pioneer Hall, which, though by no means small, afforded but about half the space desirable. From all parts of the county came admirable exhibits. That of the Arroyo Grande Agricultural Association occupied nearly all one side of the hall. Mr. Lazcano brought a superb output of peaches, grapes and apples from the San Jose valley. M. Gilbert and F. Riley from Morro, and Mr. Elberg of Los Osos, showed what those sections could do in fine potatoes of enormous size. A. M. Hardie made a splendid showing of fruit and vegetables from the Cayucos country; and the Huer-Huero District was well represented by J. V. Webster.

"There were peanuts clustered around the roots of plants that had just been pulled from the rich light soil, grapes and sorghum and sugar cane, flax, millet, vegetables, and fruits, until one was constrained to ask if there was any production of the world that would not thrive in San Luis Obispo county."

Captain W. D. Haley of Templeton gave the principal address, which was fitting, interesting and appreciated by his audience. A baby-show and a promenade concert enhanced the enjoyment of the closing day, and the financial outcome matched the other successes achieved. Every one concerned appears complacent, if not indeed elated, and there is serious talk of building a pavilion before another year rolls round.

An inspection of the subjoined list of awards will give some notion of the comprehensive richness of the exposition.

Awards—Horses.

ROADSTERS—Best team, Cleo and Jessie. E. Graves; stallion, Brelas, 4 yrs old or upward, E. B. Ballard; stallion, Al-Alien, J. H. Orcutt.

YEARLINGS, TROTTERS AND THOROUGHBREDS—1st prize, Elect, E. Cerf; 2d, Dude, and 1st filly, Evelta, Geo. Van Gordon; running yearling, Enterprise, J. Price.

ALL PURPOSE—Stallion, Crown Prince, 4 yrs old and over, mare, 2 yrs old, sucking colt, E. W. Steele; stallion, Chief, 2 yrs old, T. Andrews; Fanny, 3 yrs old and upward, G. Gates.

GELDINGS—Ned, 3 yrs old and upward, L. M. Warden; 2 yrs old, H. M. Warden.

MARES AND COLTS—Lady Tiffany, 4 yrs old and upward, and colt by Antevolo, Brown & Taylor; Stewart mare, 3 yrs old and Altoona colt; mare 1-year-old, 2 mares and 2 sucking colts, E. W. Steele; mare, 2 yrs old and over, sired by Goldsborough, imported from Australia, G. Van Gordon; 4 mares and colts by Gaviota (special), P. W. Murphy; stallion, Bayard, 3 yrs old, P. Kelly; stallion, De-Lesseps (special), J. Wilkinson.

CARRIAGE HORSES—Span, J. Andrews; single carriage horse, J. E. Mosher.

SWEEPSTAKES—Stallion, Altoona and family, G. Steele; stallion, Gaviota with family (special), and stallion, Gaviota, any kind or age, P. W. Murphy; mare, Lady Tiffany, any breed or age, Brown & Taylor; gelding, 3 years old or upward, G. Gates; mare, Princess, with four colts, H. M. Warden; colt any breed or age, W. H. Taylor.

Cattle.

HOLSTEINS—All (10) awards to E. W. Steele.

JERSEY COW—E. W. Steele.

HEREFORD—All (5) awards to G. Van Gordon, representing Sen. Hearst.

DEVON BULL—G. Van Gordon.

DURHAM—All (5) awards, H. M. Warden.

Poultry.

There was not a large exhibit of poultry, although there are many fine fowls in this county, and the only award was to Bushnell Hughston for a coop of Langshans.

Farm Products.

GRAIN, ETC.—Sack barley, W. A. Conrad; sack corn, E. A. Atwood; sack flax, sack hops, collection assorted forage plants, J. V. Webster.

Fruits.

Collection apples, 20 varieties correctly named, W. H. Taylor; collection apples, 12 varieties named, J. F. Beckett; collection not named, E. Atwood; peaches, Lazcano Bros.; plums, J. Gregory; nectarines, Mrs. E. W. Steele; foreign grapes, W. W. Hays; wine grapes, J. V. Webster; nuts, McD. R. Venable; oranges, E. Leedham; lemons, A. M. Hardie; pears, J. H. Orcutt; quinces, H. J. Price; Japanese persimmons, W. H. Findly; crabapples, J. F. Beckett; blackberries, Mrs. J. V. N. Young; strawberries, G. Jaspas; collection various kinds of fruits, J. P. Andrews; dried apples, apricots, nectarines and peaches, Mrs. E. W. Steele.

Garden Products.

Largest general display fruit and vegetables, Arroyo Grande Agricultural Association; Chili Garnet potatoes, Oregon Blue potatoes, Burbank potatoes, M. Gilbert; Peerless potatoes, (40 making 100-lb sack), M. Elberg; sweet potatoes, carrots, onions

(different varieties), cabbage, J. V. N. Young; white beans, O. Root; pink beans, J. G. Stevenson; water-melons, Mrs. Lowther; black Spanish melons, F. Melton; Hubbard squash, Butman squash, coconut squash, S. M. Findley; Kershaw squash, J. V. Webster; Crookneck squash, C. Greib; Yokohama squash, Chili Monarch peas, J. Gregory; six squash, total weight 1224 lbs, one squash, weight 216 lbs, China winter radish, T. B. Records; pumpkins, cucumbers, G. O. Taylor; cauliflower, A. B. Hasbrouck; Danvers onions, W. E. Ahalt; Spanish radish, J. McGlashen; Rutabaga turnips, beets, J. D. Roberts; red peppers, G. Jaspas; peas, J. G. Stevenson; tomatoes, Mrs. Huyck.

Plants and Flowers.

Hot-house plants, Mrs. Robbins; cut roses and dahlias, Mrs. R. E. Jack; fuchsias, Miss Bouldin; lillies, Mrs. Orcutt; leaf plants, Mrs. Bromley; hand bouquet, Mrs. Sinsheimer; parlor bouquet, Miss Leland; vase bouquet, Mrs. Spencer; ornamental evergreens, Mrs. Hogan.

Miscellaneous.

Cheese, E. W. Steele; butter, Mr. Wilhoit; hams, bacon and lard, S. L. O. Packing Co.; pickled olives, D. F. Newson; raw silk and silk cloth, Mrs. Spurgeon.

WORTHY OF SPECIAL MENTION—Three squash, O. Root; one watermelon, 44 lbs, Mrs. R. S. Brown; cucumbers, R. Farmer; carrots, stock beets and table beets, A. M. Hardie; variety peppers, J. V. N. Young; tomatoes, G. Jaspas; cabbage and cauliflower, Jno. Edgar; Keashan squash, J. G. Stevenson; one squash, 190 lbs. carrots, R. Farmer; sunflower, 17 inches in diameter, H. Olmstead; White Elephant potatoes, Jno. Enos; Charal oak potatoes, E. Leedham; Peerless potatoes, E. Jaspers; rhubarb and celery, G. Jaspas.

Ukiah—12th District.

Ukiah was thronged with visitors on occasion of the fifth annual fair of the Twelfth District Association, which came off Oct. 11th to 15th, and from all we gather the Lake and Mendocino people are more than ever confident that just as good cattle and horses, hogs, Angoras and chickens can be raised in those counties as anywhere else, and that their soil will produce anything, from walnuts to squashes, the plumpness of cereals, the finest hops, fruits and vegetables, and that abundantly.

The management was criticised for its tolerance of gambling and tipping on the grounds, and there was plaint as to the scantiness of agricultural products shown, but we have noted none whatever as to the quality of what was exhibited.

G. W. Scudamore of Scott's valley, Lake county, made a particularly attractive display of fruits and vegetables. Mr. Nowdesha, from the redwood belt west of Ukiah, brought in large apples and clusters of grapes.

At the stock pasture Holstein cattle and Norman horses were in the majority.

The receipts amounted to over \$3000, and so far outran the expenses incurred that the directors were able to make good last year's deficiency.

Miss Mary White's prize essay and Anna Morrison Reed's prize ode were read by their authors, Friday evening, and well received.

The awards of special interest to the RURAL's constituency were as follows:

Awards—Live-stock.

CATTLE—Jerseys, bull, J. R. Johnson; cow, T. J. Fine. Holsteins, all awards to J. Mewhinney. Graded bull, A. B. Montgomery; heifer, J. Mewhinney. Sweepstakes, bull and cow, J. Mewhinney.

HORSES—Thoroughbred, stallion, J. Wathen; mare and 5 colts, W. J. Hildreth; mare, special, M. C. Briggs; colt, G. B. Nichols; graded stallion, G. B. Nichols; mare, L. H. Gruell; colt, J. D. Curtis; graded, 2-year-old roadster, H. A. Peabody; graded roadster, mare, L. H. Gruell; graded stallion and colts, W. J. Hildreth; graded mare and family, T. Charlton; 2d roadster, W. A. Hagans; carriage horses, Wm. Isbell; buggy horse, J. D. Curtis; horses of all work, 2 yrs. and over, D. W. Gruell; 1-year old, R. Hayworth; colt, S. Neil; draft stallion, A. Switzer; 2d do, J. D. Ball; span draft horses, J. M. Luce; draft horse, any age, F. M. Burroughs; sweepstakes; draft mare 3 yrs and over, L. F. Long; 2-year-old, do, T. J. Fine; 2-year-old horse, G. B. Nichols; yearling draft horse, F. M. Burroughs; yearling draft mare, J. R. Johnson; sucking mare colt, G. McCowen; sucking stallion colts, Thos. Parsons; mare and family, T. J. Fine.

ANGORA GOATS, J. F. Todd.

BERKSHIRE BOAR, W. J. Hildreth.

POULTRY, exhibit and pedigree cochins, J. L. Burger; silver-spangled Hamburgs, J. R. Johnson.

Fruits, Vegetables, etc.

Dried hops, A. V. Stanfield; Irish potatoes, P. Morrissey; sweet potatoes, Van Cleveland; Mangel Wurtzel, J. R. Johnson; squash, G. W. Busch; corn in ear, cabbage, turnips, A. Garaventi; pumpkins, apples, peaches, pears, plums, table of fruit, G. W. Scudamore; quinces, George McCowen; almonds, Pearl Fine; cut hardy and green-house plants, Mrs. C. P. Smith; cut flowers, Mrs. J. M. Mannon; fruits and jellies, 1st, Mrs. S. J. Chalfant, 2d, Sallie Peabody; wine, L. Peters & Co.; bulbs, C. Purdy.

Miscellaneous.

Cheese, D. W. Rupe; butter, 1st, Mrs. A. O. Carpenter, 2d, Mrs. J. R. Johnson; honey and beeswax, J. H. Schefer; harness of all work, C. H. Whitten; flour, and patent hoe, Wm. Isbell.

WHO WROTE SHAKESPEARE?

How the Element of "Doubt" Leads to Grand Achievements.

The world is agitated again over the question of who was the author of Shakespeare's plays.

The world is full of doubting Thomases. The man who has been successful in exciting the present momentary interest in the subject is, like most successful agitators, an Irishman. He claims to have discovered a cipher running through the Shakespearean plays which proves them to have been written by Lord Bacon. It is also claimed that there is a cipher in the epitaph on the moss-grown tombstone, which, properly interpreted, leads to the same conclusion.

This age shows a decided inclination to pry into mysteries.

It can make no difference to Shakespeare now whether the world believes he wrote the plays that bear his name or not.

The plays are immortal. Ignatius Donnelly cannot rob us of these grand works, even though he should succeed in robbing Shakespeare of his glory.

Were it not for doubting Thomases many of man's great accomplishments would never have been brought to successful issue.

Men have been stricken down without warning. Doubt put in motion the investigation which ascertained the cause. After the discovery of the cause, the world was ignorant of any remedy with which to stay the terrible slaughter of humanity, and medical science said it was impossible. Doubt led the way to the light, and Warner's safe cure solved the seemingly unsolvable problem. Its friends tell us with conclusive proof that the unsuspected kidney disease befalls the blood and causes most of our diseases!

For years the heart was looked upon as the most important organ in the body, but doubt led to further inquiry, which developed the fact that the kidneys are the real blood-purifiers of the system, and these organs now attract the first attention of the careful practitioner. It is now a recognized fact that if they are put in a healthy state by the use of that remedy possessing such wonderful curative and cleansing powers, most of the prevailing diseases of the system will be easily overcome, since their cause will be removed.

How unimportant, in comparison with such problems, is the present discussion as to the authorship of Shakespeare!

NITROGENOUS SUPERPHOSPHATES

—OF THE—

MEXICAN PHOSPHATE & SULPHUR CO.,

The Best Fertilizer in the World!

IN USE IN ALL PARTS OF THE OLD WORLD AND ACKNOWLEDGED TO BE
THE BEST KNOWN.

We have been shipping this material for years to our Agents, Messrs. SCHRODER & MICHAELSON, HAMBURG, and under date of January 4, 1887, they wrote:

"The demand for your phosphates continues very good, as you will see from our having sold so far ahead as September and October arrival, at full prices, and we could to-day place a much larger quantity if we only had them to offer."

Under date of January 26, 1887, Messrs. SCHRODER & MICHAELSON, alluding to letters acknowledged, write as follows to H. M. NEWHALL & CO.:

"They referred partly to the quantity of Mexican Guano which we may expect to receive in the course of the present year, in regard to which our repeated inquiries addressed to the Company had so far brought no reply. We are glad to note from your telegram that Mr. Halsey has now written us on the subject, but we are, on the other hand, somewhat disappointed at the SMALLNESS of the figure you name (8000 to 10,000 tons) which we hope is exclusive of the 'Tranmere' and 'Saigon' cargoes. We have, in fact, in consequence of the numerous inquiries for this guano, been placed in an awkward position, through not being able to give any reliable information to our buyers in regard to the quantity of Mexican Guano forthcoming during the present year."

Its Introduction into California has been marked with the most gratifying results.

IT IS THE CHEAPEST, BECAUSE THE MOST EFFICACIOUS! THE SAFEST, BECAUSE DIVESTED OF ALL ORGANIC MATTER!
AND IS TOTALLY INOFFENSIVE TO TOUCH OR SMELL!

We invite correspondence with Farmers, Viticulturists and others interested, and are prepared to give the minutest details in regard to this most valuable Fertilizer. For particulars of Analysis see certificate of Dr. Schneider and testimonial of Professor Hilgard in another column.

Potatoes at the East.

It seems likely that Eastern people will want more of our potatoes this year, although they have been taking them at a lively rate for some time past. It is reported that the outlook of the Eastern potato crop has held poor all the season, until by November 1st the experts concluded that the end of the growing season left them with the slimmest yield per acre, if not the shortest crop on the whole which has ever been known. With the average crop placed at 100, the reports from growers this year only reached 62½, or only ⅔ of an average crop. Pancoast & Griffiths of Philadelphia, in a review of the season, state that the failure of the crop West is attributed to the long and severe drouth, and the late ruin of the crop in the East to the rot resulting from continued excessive moisture here. In Ohio there will not be dug much over one-quarter of a crop, and in New York State, where the previous indications were more favorable, the crop will not be over one-half. The rot has set in generally, and many fields are not worth the digging. Faulty potatoes are now being crowded upon the markets because they will not keep. This tends to depress the demand for the time, but as soon as such stock is out of the way prices will certainly advance, and there is nothing to prevent sound potatoes from selling higher at the East the coming winter than for many years.

This would indicate that with reasonable freights there is likely to be all the potatoes that we can spare called for by the Eastern markets. Nor is the scarcity there likely to be of short duration unless supplies turn up from some unexpected source. It looks as though there would also be a very profitable business done in early new potatoes for the East, and those who have early land should give attention to the condition of affairs. If we can get our excellent new potatoes there in quantity at reasonable prices there promises to be a quick demand for them.

These facts are simply in accord with what we have always claimed, that there are big things for California in the lowly vegetable as well as in the regal fruits. Let us give attention to all our opportunities, and each choose the crop for which his land and situation are best adapted.

The Educators are Coming.

The National Educational Association will hold its next annual meeting in San Francisco—so much has been decided by the Executive Committee, and they have imparted their decision to Supt. Campbell.

This seems to imply that satisfactory arrangements have been made as to round-trip tickets, and certain other matters which were in question. Those who have read the resolution of the State Grange, urging the several railroad companies to consider the importance of reducing the fares in order to secure the holding of the above convention in California, will be pleased to see that the desires therein expressed have prevailed.

It is proposed to issue a 16-page prospectus, containing a full program of the general and department sessions of the convention, together with information as to rates of fare, routes of travel, accommodations, points of interest, and whatever else the excursionists are likely to want to know about. These will be mailed to about 150,000 of the leading educators in the United States.

The session is to open on the 17th of July, and it is hoped that even more than the 12,000 who attended the Chicago meeting last summer will be glad and able to avail themselves of the opportunity to take a cheap three-months' excursion to California.

POULTRY SHOW.—It is stated that the committee of the California Poultry Association has decided upon San Jose for the grand poultry fair in January, 1888, if favoring local arrangements can be made. This will be an opportunity for San Jose to score another grand success in an industrial display. She has done much in the fruit line and in field and farm products. Similar effort and co-operation will mass one of the grandest poultry displays ever seen in the State. It will do the district much good by drawing the attention of poultry fanciers thereto, and it will also awaken the people generally to the advantage of the high-class poultry. We hope the enterprise will go forward heartily.

HEREFORDS AT SANTA BARBARA.—Thirty-one head of the Hereford cattle, imported by Vaughan & Williams, which attracted so much notice during the State Fair, and have been mentioned repeatedly in our columns, are now at F. T. Underhill's Ontare ranch near Santa Barbara.

Santa Cruz Fair.

The Santa Cruz fair for 1887 was opened on Wednesday, Oct. 12th, and continued throughout the week. One of the first things to catch the eye of one entering the pavilion was a handsome sign at the farther end, "Santa Cruz County Fair." The letters were made of green grapes, with an edging of cranberries; the border of the sign was of grape-leaves and pampas plumes, and the corner pieces of barberries. The committee on decorations was highly complimented for its work as a whole. The exhibits of cereals, of apples, pears and grapes, of evaporated fruits, of flowers and of agricultural implements, were very creditable. Doctor C. L. Anderson made an interesting display of dried grasses from different portions of the Union.

A 48-pound beet, shown by C. Horstman of Boulder, two redwood planks, each 30 feet long, 30 inches wide and four inches thick, by Olive & Co., and a potato-vine trained on poles by Rev. T. M. Merriman to a height of nearly 10 feet, were among the big things on exhibition.

An enormous sea-turtle, lately captured by a Soquel fisherman, and measuring eight feet from the tip of its nose to the end of its tail, was to be seen in a pen by itself.

The South Coast Paper Mills' output of straw paper was remarkably even in texture, tough and proof against dampness.

For the rest, we must content ourselves with publishing the

List of Awards.

Exclusive of jellies, pickles, fancy work and pictures. Where one-half premiums are mentioned, it means that only one-half of the premium was awarded, as there were no competitors in the particular exhibit:

Live-Stock.

Martin Kinsley—One-half first premium for bay mare; 2d premium for draft stallion, Solide; 1st, for Mederic; 2d, for Jersey bull Hermes; also ½ 1st for the following: Southdown ram, ewe, pen lambs, and ½ 2d for Essex boar and sow. Dr. O. L. Gordon—1st Jersey bull; 2d, Jersey cow; ½ 1st for graded heifer calf and T. B. calves, 1st for 2-yr-old colt. A. Noble—½ 1st, for Durham bull; 2d, for 4-yr-old roadster. U. W. Thompson—2d, for stallion; ½ 1st, for ewe and lambs. I. H. Hammond ½ 1st, for 2-yr-old roadster. A. Liliencrantz, 1st, for roadster, and graded yearling mare. F. A. Hihn 2d, for mare; 1st, for suckling colt. J. A. Jackson—2d, for suckling colt. S. Blodgett—½ 1st, for stallion, Jack Frost. L. T. Almstead—1st, for 5-yr-old stallion. J. A. Gilbert—½ 1st, premium for cashmere goat and kids. Irma Scott—½ 1st, for cashmere goat. L. Lemon—½ 1st, for Jersey calf. Mrs. M. J. Rulofson—1st, for Jersey cow, Pert. J. Smith—½ 1st, for cashmere goat.

Poultry.

O. A. Longley—1st, pen light Brahmas; 2d, pen of Wyandottes; 1st and 2d, light Brahmas; do Wyandottes; largest and best collection of poultry. Miss L. Kloss 1st, Rouen ducks and Toulouse geese. M. Kinsley—1st, for silver-spangled Hamburgs; 2d, Toulouse geese. O. L. Gordon—1st for game bantams. Harry Towne—1st, red game bantams. H. F. Kron—1st, Plymouth Rocks.

Dairy Products.

F. D. Baldwin—2d premium for butter. G. M. Shippy—1st premium for butter. G. P. Laird—½ 1st, (?) cheese.

Grain and Vegetables.

Wm. Kropf—1st, potatoes. F. A. Hihn—1st, corn; 2d, barley. M. Kinsley—1st, oats. U. W. Thompson—2d, beets. J. Mattison—2d, wheat. A. Noble—1st, yellow squash. J. Thompson—1st, cabbage. W. H. Talbot & Co.—1st, carrots. P. T. Stribling—1st, watermelons. W. W. Waterman—1st, radishes and cucumbers. C. L. Anderson—2d, ootatoes. E. Bancher—1st, pumpkins. C. Frapwell—1st, beets. F. F. Wilson—2d, melons.

Fruit.

L. H. Comstock—coll. apples. 2d var. peaches, 1 var. prunes, 1 var. figs, cider vinegar, 1st display plums, do dried fruit, 2d sun-dried peaches, display of figs and raisins. J. S. Young, 1st, 10 var. apples. S. Blodgett, 2d do, 2d 3 var. apples. W. J. Dakin, 1st 5 var. apples, do pears. H. Foster, 2, 5 var. apples. Doyle & Harmon, gen. display fruit, 2d display table grapes. P. T. Stribling, 1st, 3 var. apples, evap. pears, dried apples and peaches. Mrs. C. McKenzie, 1st, plate apples, 2d almonds, 2d plate pears, 2d canned fruit. P. Peterson, 2d plate apples, 2d variety figs, sun-dried pears and sun-dried apples. A. Noble, 2d 5 var. pears. A. Noble, 2d do. H. Comstock, 1st 3 var. pears. T. Slaughter, 2d 3 var. pears, 1 var. peaches, 1 var. canned fruit, 1st prunes, sun-dried plums, sun-dried peaches, 2d sun-dried apples. J. H. Dennett, 1st plate pears. M. Clough, 1 var. plums. M. Kinsley, 2d do. T. Newman, 1 var. lemons. F. A. Hihn, 2d do and 1st orange. J. S. Gilbert, 1st almonds, 2d display dried fruit, 1st sun-dried apricots, 2d sun-dried plums, 2d sun-dried pears. C. Steinmetz, 1st walnuts. Mrs. L. Curtis, 2d do. W. W. Waterman, 1st gen. display grapes, 2d plate do. H. Mel, 2d gen. display grapes, 1st plate do, white and red wines, wine vinegar. J. W. Jarvis, display wine grapes. C. Horstman, display table grapes. H. Owen, 1st exhibit canned fruit. Mrs. R. M. Woods, 2d var. canned fruit. L. K. Baldwin, 2d display plums. J. Gray, 2d prunes. The committee said they found the fruit show of such unvarying merit that it was perplexing to decide which was the best. They made honorable mention of several other exhibits besides those named in above list—among them being Cuthbert raspberries from Mrs. McCann, and Cuthbert, Lawton and Kittatiny from W. J. Dakin, and there were also a number not properly entered or not entered at all, which for these reasons did not receive the attention they deserved. The display of dried fruit from Watsonville was an instance of this sort.

Floral Department.

Mrs. R. M. Woods, 1st floral design (white elephant). Mrs. A. Thompson, 2d do. T. Thompson, 1st exhibit plants. Mrs. W. H. Miller, 2d do.

The Culture of Farm Crops.

The necessity for an accurate knowledge of the principles of Agriculture for the guidance of farmers, presented in a plain and simple manner so that it can be easily understood, has been very apparent to all concerned, both to those whose business is to teach and to those who have to learn. This paramount need has led to the production of a Handbook of Agricultural Science and practice by the well-known author and writer upon Agricultural matters, Mr. Henry Stewart. This work is entitled the "Culture of Farm Crops" and is intended to tell the whole story of farm practice and to explain the principles upon which this practice is based. This is done in such a plain and intelligible manner as to be readily comprehended by any farmer or farmer's boy, in 50 short chapters, all contained in a little more than 300 pages. The subjects treated of comprise the nature and condition of all the elementary matter which enters into the substance of plants; the nature and composition of the soil; the elements and processes of plant growth; plant food; composition of agricultural plants; what crops take from the soil; manures and the elements of them, and their action in and upon the soil; tillage, and its primary importance to the successful growth of crops; and the culture of various crops grown upon the farm. The reputation of the author is a guarantee of the accuracy and excellency of the work, and the book is presented by the publisher in a handsome and attractive form. It has a full table of contents and a copious index, by which reference to any one of the numerous subjects treated is made quite easy. This book should be in every farmer's house and in every student's library; for the farmer it is a library in itself and for the student a most valuable book for reference, because of the very large amount of matter which is condensed in its pages. It is published by Duane H. Nash of Millington, Morris Co., New Jersey.

WISCONSIN FARMERS' INSTITUTES.—We recently published a note concerning these interesting meetings. We now receive from W. H. Morrison of Madison, Wis., the first number of "Wisconsin Farmers' Institute Bulletin." Its publication will be annually, and will be a compendium of practical farm literature; 31,000 copies of this bulletin will be distributed free to the farmers of Wisconsin at the 82 Farmers' Institutes which will be held this winter. The result of this good seed so widely sown will be a grand harvest of intelligent farmers who will read, study, think and exalt their vocation and be proud of it. The work is a good one.

Youthful Indulgence

In pernicious practices pursued in solitude, is a most startling cause of nervous and general debility, lack of self-confidence and will power, impaired memory, despondency, and other attendants of wrecked manhood. Sufferers should address, with 10 cents in stamps, for large illustrated treatise, pointing out unfailing means of perfect cure, World's Dispensary Medical Association, 663 Main Street, Buffalo, N. Y.

Advice to Consumptives.

On the appearance of the first symptoms, as general debility, loss of appetite, pallor, chilly sensations, followed by night-sweats and cough, prompt measures of relief should be taken. Consumption is scrofulous disease of the lungs; therefore use the great anti scrofulous or blood-purifier and strength-restorer, Dr. Pierce's "Golden Medical Discovery," superior to cod liver oil as a nutritive, and unsurpassed as a pectoral. For weak lungs, spitting of blood, and kindred affections, it has no equal. Sold by druggists. For Dr. Pierce's treatise on consumption, send 10 cents in stamps. World's Dispensary Medical Association, 663 Main St., Buffalo, N. Y.

The Billows.

Dyspeptic, constipated, should address, with 10 cents in stamps for treatise, World's Dispensary Medical Association, 663 Main Street, Buffalo, N. Y.

SEED SELLING SWINDLERS.—A gang of sharpers, calling themselves the "Empire Seed Company," have been fleecing farmers in the Willamette valley this fall, selling them seed-wheat at \$15 per bushel, and getting their notes with a promise of giving them back in payment for part of next year's crop. They attempted to negotiate some of the notes at a Portland bank, and one of them, Hogan by name, has been arrested in S. F. and taken to Oregon by the sheriff of Lane county on a charge of obtaining money under false pretenses.

Consumption Surely Cured.

To the Editor:—Please inform your readers that I have a positive remedy for the above named disease. By its timely use, thousands of hopeless cases have been permanently cured. I shall be glad to send two bottles of my remedy FREE to any of your readers who have consumption, if they will send me their Express and P. O. address. Respectfully,
T. A. SLOCUM, M. C., 131 Pearl St., New York.

SWEET POTATO FLOUR.—A patent has been issued for a process of treating sweet potatoes for making flour. The object of the invention is to produce a wholesome and nutritious article of diet from the sweet potato, one that will not become frozen or decayed, and which will embody all the valuable portions of the potato, especially the starch and saccharine matter. The sweet potato is a luxury, and when in its natural state and out of season is difficult to get, except at exorbitant prices, owing to its liability to rot and freeze. This invention designs to so treat the potato that the starchy saccharine matters, with a quantity of the glutinous portions, may be obtained and readily transported to any portion of the world, as a staple product similar to flour, and it being a well-known fact that chemical changes will accrue to the liquid portion of the potato in climates other than where it grew and destroy its natural flavor, an essential feature of the process is to quickly evaporate such liquids while the potato is in a healthy condition, and reduce it to a flour or meal, which will retain the natural flavor of the esculent. The product obtained according to the invention may be made into puddings, pies, cakes, custards and the like.

S. F. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Nov. 22, 1887.

Continued dry weather, with colder nights, causes considerable uneasiness, owing to the lateness of the season. All kinds of farm products have been in better demand the past week, with a general improvement in prices noted. Barley and also wheat have been largely dealt in on Call for futures. The Eastern and European markets have exhibited more strength, with a higher range of values telegraphed. To-day's cable is as follows:

LIVERPOOL, Nov. 22.—Wheat firm; California spot lots, 6s 7½d to 6s 10½d; off coast, 34s@34s 3d; just shipped, 34s 9d; nearly due, 34s 9d; cargoes off coast, firmly held; on passage, appears to be a better feeling; French country markets, firm; wheat and flour in Paris, firm; weather in England, cold and wet.

Eastern Grain Markets.

S. S. Floyd & Co.'s telegraph of the 22d, from their Chicago house, is as follows: Wheat market acted toppy all day. Somebody seemed to keep selling freely on all the hard spots; guess the local longs were out of bull argument when they had to resort to war news yesterday. Market closing tame at lowest point of the day. Corn, dull and neglected. Receipts of wheat at 7 primary points to-day, 426,970 bu. Shipments, 413,758 bu. Wheat, Dec., opened, 76½¢; highest, 76½¢; lowest, 76¢; closed, 76½¢; May, opened, 83¼¢; highest, 83¼¢; lowest, 82½¢; closed, 82½¢. Corn, Dec., opened, 44¼¢; highest, 44¼¢; lowest, 43¼¢; closed, 44¼¢; May, opened, 49¢; highest, 49¢; lowest, 48¼¢; closed, 48½¢. Pork, Jan., opened, \$13.90; highest, \$14.05; lowest, \$13.80; closed, \$13.87½.

NEW YORK, Nov. 22.—Wheat, 89¼¢ for cash, 87½¢ for Dec., 88¼¢@88½¢ for Jan., 90¢@90½¢ for Feb., and 93¼¢@93½¢ for May.

NEW YORK, Nov. 21.—Sales of wheat at New York the last week exceeded 123,600,000 bu., and in spite of the setback at the end, which was not unnatural after three times the wheat received here in 10½ months had been sold in six days, prices closed with about 3c advance. Corn and oats advanced more than a cent, but dropped back on Friday and Saturday; sales were 14,251,000 bu. of corn and 2,242,000 of oats.

Eastern Wool Markets.

NEW YORK, Nov. 21.—Desirable wools are kept well in hand and holders demand pretty full prices. Manufacturers have taken samples to a fair extent, but have given a few important orders. Among sales were 5000 lbs. scoured California at 56c, 50,000 lbs. Territory at 18¢@24c and 16,000 Territory on private terms.

BOSTON, Nov. 21.—Market shows little change. Among the sales were 407,000 lbs. Territory at 13¢@24c and 98,000 lbs. California spring and Oregon on private terms.

Fruits.

CHICAGO, Nov. 19.—The supply of California fruits shows considerable reduction. After next week it is not expected that there will be many more grapes received, if any. Pears are also becoming reduced in stock. A firm market is quoted, with a fair demand. The following prices were received for fruit in good condition: Winter pears, \$2.25@2.75 per box, according to quality; quinces, \$1; Muscat grapes, \$3@3.50; Tokays, \$4@4.50; Cor-nichon and Emperors, \$2.50@2.70.

Dried Fruits.

CHICAGO, Nov. 19.—In California dried fruit, the demand for raisins is fair, but all other kinds rule quiet and rather dull. Peaches, sun-dried, in sacks, \$1 lb, 12½¢@13½¢; do, evaporated, unpeeled, in sacks, \$1 lb, 15½¢@16¢; do, do, peeled, in sacks, \$1 lb, 25½¢@27½¢; apricots, sun-dried, in sacks, \$1 lb, 13½¢; do, evaporated, in sacks, \$1 lb, 14½¢@16¢; plums, pitted, in sacks, \$1 lb, 13¢@14¢; nectarines, according to quality, in sacks, \$1 lb, 14½¢@16¢; raisins, loose Muscates, \$1 box, \$1.75@1.95; do, London layers, \$1 box, \$2@2.50. There is said to be quite a wide range in the quality of London layer raisins coming to the market.

NEW YORK, Nov. 21.—California raisins are in fair demand, with sales at \$1.85@2 for two crown; \$2.10@2.25 for three crown and \$2.15@2.50 for London.

Hops.

CHICAGO, Nov. 19.—Choice hops were quoted firmer and slightly higher. The export trade has drawn on stocks until choice grades are becoming a little scarce. Off grades are in ample supply, and rather easy. Pacific's new crop, choice, 18¢; Pacific's new crop, medium, 16¢@19¢; Pacific's new crop, common and low grades, 12¢@15¢; Pacific's, 1886, good, 10¢@12¢; Pacific's 1886, medium, 9¢@10¢.

Beans.

CHICAGO, Nov. 19.—The bean market is steady and firm. The supply is small. There are some California and some foreign beans here which to some extent make up for the shortage in Eastern stock. All good beans are salable, but at the same time there is no urgent demand. California, according to cleanliness, \$1.50@2.25.

Honey.

CHICAGO, Nov. 19.—California strained honey is in moderate demand at 7c.

Raisins.

NEW YORK, Nov. 22.—Raisins have a good selling future, with enlarged offering. The upper grades are about 10c off for wholesale parcels. The recent large train shipment from Fresno is a topic in the trade, and inferior stock is hard to sell. Sultanas have a fair cooking demand, averaging 6½¢@7½¢. The Malaga market is reported to be lower, feeling the absence of an American market.

Dried Fruits.

NEW YORK, Nov. 22.—Sun-dried peaches, also evaporated, are firm. Apricots also are firm and wanted. They are quoted at from 8½¢@9c.

Nuts.

NEW YORK, Nov. 22.—Paper-shell almonds are quoted at 20c; soft, 18c; with small offerings.

Local Markets.

BAGS—The market is quiet. Continued dry weather restricts operations in futures. Calcuttas June-July delivery are held at 7¢@7½¢.

BARLEY—The sample market appears to be hardening. On Call futures have been largely dealt in, with apparently more buyers than sellers, but these buyers do not appear disposed to bid up. To-day's sales on Call are reported as follows:

Morning Session: Buyer season—1000 tons, 94¼¢; 400, 94¼¢; 1700, 94¼¢; 300, 94¼¢. Buyer 1887—100 tons, 85c; 100, 84¼¢; 100, 84¼¢; 100, 84¼¢. Seller season—100 tons, 82½¢; 100, 82½¢; 100, 82½¢. Afternoon Session: Buyer season—1600 tons, 94c; 200, 94¼¢; Buyer 1887—200 tons, 84¼¢.

BUTTER—Market higher. Stocks very light, and as receipts are light, it is claimed that there is not enough to last for four weeks. The demand is only fair.

CHEESE—The market is steady. More Eastern is coming in, but high prices restrict sales.

EGGS—Strictly choice are held strong, but under heavy receipts from the East, all kinds can be bought at shaded prices on last week's quotations.

WHEAT—The sample market is very strong, with buyers reporting it difficult to buy. On Call, transactions have been large. Yesterday morning futures advanced on war rumors, but fell back in the afternoon, with the report discredited. At to-day's Call, the sales reported are as follows:

Morning Session: Buyer season—300 tons, \$1.47½; 2300, \$1.47½. Afternoon Session: Buyer season—1200 tons, \$1.47; 1200, \$1.46½; 700, \$1.46½. Buyer 1887, season's storage paid—100 tons, \$1.37½; 100, \$1.37½.

[COMMUNICATED.]

Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco, from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 to Nov. 20, '86.	July 1 to Nov. 10, '87.
Flour, qr. sks.	1,940,732	1,391,308
Wheat, cils.	7,108,334	3,988,924
Barley, cils.	1,555,152	1,386,221
Oats, cils.	98,419	111,771
Potatoes, sks.	416,885	465,289
Corn, sks.	27,297	93,873
Rye, sks.	10,478	10,837
Buckwheat, sks.	3,356	374
Beans, sks.	168,491	255,413
Brans, sks.	201,949	187,074
Hay, tons	52,127	58,399
Wool, bls.	43,846	53,778
Hides, No.	46,600	41,149
Raisins, 20-lb boxes.	76,941	44,406
Hops, bls.	11,617	12,853

The receipts of certain articles of produce from Oregon, Washington Territory and other distant points, for the same period compare as follows:

Flour, sks.	17,221	80,012
Wheat, cils.	109,985	332,444
Barley, cils.	1,198	75
Oats, cils.	130,840	60,040
Corn, cils.	44,228	12,590
Wool, bls.	9,011	6,985
Brans, sks.	26,418	24,132
Hops, bls.	648	106
Hides, No.	13,087	10,516
Potatoes, sks.	18,632	747

Cereals.

The wheat on passage for Europe on Nov. 9 was 13,400,000 bu., comprising 1,608,000 bu. to the continent and 11,792,000 bu. to the British Isles. The quantity on passage a year ago was 20,720,000 bu. The quantity of corn on passage for Europe Nov. 9, 1887, was 2,912,000 bu., against 3,040,000 bu. a year ago. The quantity of wheat was decreased in the week 240,000 bu., and corn 40,000 bu. The quantity of wheat on passage to the British Isles on the 27th ult. was 12,354,000 bu., comprising 8,801,776 bu. from the United States, including 7,160,000 bu. from California, 560,000 bu. from Azov sea, 204,000 bu. from the Danube, 1,440,000 bu. from British India, 800,000 bu. from Chili, 228,000 bu. from the Argentine Republic, and 260,000 bu. from Australia.

French imports of wheat (and flour net) for the 9 months from Jan. 1 to Sept. 30, 1887, have been equal to 27,352,389 bu. of wheat, against 16,945,780 bu. the corresponding time in 1886, and 20,131,158 bu. the corresponding time in 1885.

Wheat crop prospects in Europe and the United States, in April next, will not only have a bearing on the demand for wheat, but also on its price. With exceptionally fine prospects for the wheat crop in Europe and America in April next, and the probable supplies that may be obtained within and without Europe if Australia and India shall usher in the year 1888 with a bountiful wheat crop, there does not seem to be much, if any, encouragement for any marked improvement in values of wheat; but should the prospects for the wheat crop be unpropitious, and should Australia and India have poor wheat harvests, there would seem to be a possible relief from the present abnormally low range of values.

In the United States domestic consumption is disposing weekly of about 6,600,000 bu. of wheat. Nearly one-half of our available export surplus wheat has gone out of the country within 18 weeks. There is some apprehension in regard to the winter wheat. Plowing for the spring wheat crop usually done in autumn is more backward than usual. The export movement from the Pacific Coast is light. The total exports, wheat and flour, have now dropped below 1,500,000 bu. weekly. In Europe the wheat crop was about 1,200,000,000 bu. in 1887. The consumption there is something over 100,000,000 bu. per month, which has, since August 1, disposed of about 300,000,000 bu., with 900,000,000 still remaining. This quantity requires to be supplemented by foreign wheat, which will be taken only as needs shall dictate.

The New York Produce Exchange Reporter of Nov. 12 has the following on the wheat situation: The wheat situation is regarded by the majority of dealers in options as exceedingly strong, hence they express great disappointment that most foreign markets show so little buoyancy and animation, knowing as they do that they must depend so largely on this country for supplies to make good their deficiencies. It is very evident that Russia, India, Chili, Australia and Hungary cannot supply the

enormous wants of Great Britain, France, Italy and Spain; hence the moderate surplus of this country is certain to be called for, and for what we have to spare fair prices should be counted on. Present prices we regard as too low under the circumstances, and there is room for a marked improvement. The serious deficiencies in our corn, rye and barley crops will restrict our exports of wheat and flour, and to a greater extent than the public generally have any idea of. The attentive reader is aware of the position we occupy in regard to the world's supply, the product of grain for the year ending with the 31st of August was below its wants, and we shall have to draw upon the reserves of old grain on hand at the close of August to tide us over the year ending with August, 1888.

The market for wheat on this coast is very strong, with large holders in this State not disposed to enter the market as sellers except at an advance on buyers' bids. Although the dry weather has much to do with the strength of the market, still the statistical situation throughout the world has more to do with it. In this market there has been a steady advance in prompt shipments. In August last cargoes of No. 1 were sold as low as 28s per quarter, but the past week as high as 35s was paid, a difference of about 35c per cental.

Eastern mail advices report maltsters buying sparingly of barley, under the impression that a lower range of values will obtain; but as the crop is all of 20 per cent below an average it is generally conceded that they will have to come in on the market by spring at a much higher range. The stocks of all grades in this city are being rapidly depleted under a good demand from consumers and for shipping. The dry weather is quite a factor in promoting a strong tone, but owing to the fears of rains soon the feeling is not sufficiently pronounced as to cause a large bull movement.

Oats are very strong under a good demand, light stocks and only fair receipts.

Corn is reported easy for ordinary grades, but choice to extra choice is strongly held under light supplies. The demand is slow, as buyers hold off as long as possible, hoping for concessions.

Feedstuff.

Carrots and other feed vegetables are in good demand, but prices are unchanged.

Straw is meeting with larger consumption. It is bought for chopping up with ground barley.

Hay continues to rule very strong. Choice grades are scarce and command from \$17 to \$19 per ton. The dry weather causes holders to sell sparingly.

Bran, middlings, ground barley, oilcake meal, etc., move off freely at full prices.

Fruits.

Grapes are going out, causing the better keeping to fetch good prices. Wine grapes come in sparingly, causing good prices to obtain.

Apples are meeting with a heavier demand from consumers, causing strong prices to rule for the more choice varieties. Sales of high-colored choice have been made in a small way as high as \$1.75. Defective apples are in liberal receipt, but as choice are higher, these in sympathy fetch more money.

Pears are in fair supply, with choice fetching good prices.

Dried fruits continue slow, but the tone of the market is strong, owing to supplies being well held and the general belief that a higher range of values will obtain after the turn of the year, or after present stocks carried by the retail trade are exhausted. The East is drawing on us to some extent.

Raisins are being shipped to the East quite freely, causing stocks in this city to be light. The demand is exceedingly active for the holiday trade. This, of course, applies to the more choice grades, for poor are at all times hard to place.

Vegetables.

Potatoes have a stronger tone for the more choice and well conditioned, but as receipts of all kinds are heavy, it is difficult to advance prices; sweet potatoes are higher.

Onions are in good demand, but receipts being free, prices keep down.

Cold weather, with frosty nights, has lessened the receipts of tomatoes and other vine vegetables, causing a hardening in prices. Cabbages are in good supply.

Marrowfat squash and pumpkins are in fair demand.

Live-Stock.

Beef cattle continue to be received quite freely from distant points, which keeps our market in buyers' favor. There is a better inquiry for stall-fed, but as feed is very high, the supply is as yet light. As the consumption is larger and the weather is cooler, butchers carry larger supplies. Mutton sheep are in good demand. Receipts are only in orders. Hogs are only offering fairly well. This is due to packers bidding down, and also to those running on acorns not being taken off as yet, freely. The dull and easy market for provisions causes buyers to bid down. Milch cows are hard to sell, owing to the high cost of feed. In horses, last week's remarks cover this week's report.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7¼¢@7½¢; first grade, grass fed, 6¼¢@6½¢; second grade, 5½¢@6¼¢; third grade, 5¢@5½¢.

MUTTON—Ewes, 5½¢@6c; wethers, 6¢@6½¢.

LAMB—Spring, 7¢@8c.

VEAL—Large, 6¢@7c; small, 6¢@8c.

PORK—Live hogs, 4¼¢@4½¢ for heavy and medium; hard dressed, 6¼¢@7¼¢ per lb; light, 4¢@4½¢; dressed, 6¢@7¼¢; soft hogs, live, 3½¢@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way	339,261	252,780
In port, disengaged	75,808	72,000
In port, engaged	29,626	96,018

Totals..... 444,695 420,798

To get the carrying capacity, add 60 per cent to the registered tonnage as given above.

Turkeys are having large sales for Thanksgiving. Prices are advanced, but heavy receipts are looked for, which, if proven correct, will send prices down. Choice hens are wanted at full prices, as are choice young roosters, ducks and geese.

Choice hops are more inquired for, owing to the stronger market at the East. Buyers here are bid-

ding down, but quietly pay good prices for sound parcels of choice.

In wools there is nothing new to report. The heavy sales of the past fortnight reduced selections. It now looks as if prices for the year's clip will rule higher than last spring.

Eastern advices report flaxseed high, owing to the light crop and good demand.

San Francisco, Nov. 22, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations. TUESDAY, Nov. 22, 1887.

SQUIRREL AND GOPHER EXTERMINATOR!
IN 1-LB. AND 5-LB. CANS.

\$250.00 Free! Free!
A GREAT OFFER.
In order to extend our list of names, we will put into a box a card bearing the name of each person who sends us the names and post-office addresses of ten young gentlemen or ladies between the ages of 15 and 25 years, who would be likely to attend a Business College or Normal School. These names must be sent in before the 4th day of February, 1888. On that day Messrs. Trask & Ramsey, in the presence of the whole faculty of the Business College and Normal Institute, will draw out the names of five persons, to whom will be presented the following scholarships. These scholarships will entitle the persons to whom they are issued to instruction in the largest and best conducted private school on the Pacific Coast.
BUSINESS COURSE, six months, \$50.
SCIENTIFIC COURSE, one year, \$50.
SHORT-HAND AND TYPE-WRITING, 6 months, \$50.
NORMAL COURSE one year, \$50.
TEACHER'S REVIEW COURSE, nine months, \$50.
CONDITIONS.—Applicants for any one of these five scholarships must be between the ages of 15 and 25 years, and must not be residents of Stockton.
A person drawing either one of these scholarships can have his choice of either of the five courses of study named above.
Write your name and post-office plainly, and state which one of the scholarships you are an applicant for.

EUREKA GANG PLOWS.
THE FAVORITE.
AWARDED FIRST PREMIUMS at the State Fairs of 1877, 1878, 1879, 1880, 1881, 1882, 1883, and numerous County Fairs.
THE LEADING GANG PLOWS OF THE UNITED STATES. They are made to adapt themselves to various kinds of soil, and are supplied with different patterns of Plow Bottoms.
These implements have received more State and County Fair Premiums, have been successful in more plowing contests, and have met with a more extensive sale than any Gang Plow ever invented.
They have been the Plows against which all dealers and manufacturers interested in the sale of other Gangs have waged the fiercest war, and the ones by which inventors have measured their efforts, well knowing that if they could make a more satisfactory implement than the Eureka, they could justly claim to have the best.
The efforts in this direction, both by Eastern and California Inventors, have been strenuous and unremitting, and possibly might have been crowned with success but for certain stumbling blocks in the shape of broad patents, covering all essential points, whose validity they have compelled us to establish in the courts.

FOR SALE BY
BAKER & HAMILTON.

LIFE-SAVING APPARATUS OF REINDEER HAIR.
A Norwegian engineer, Herr W. C. Moller, of Drammen, Norway, having had his attention drawn to the extreme buoyancy of reindeer hair, has succeeded in constructing various articles of this material for life-saving at sea, with which some interesting experiments were recently made. The first life-saving object tried was one which can be used on board ship, as a chair, bedstead or couch, but which, in case of need, may be converted into a small boat. This apparatus was found capable of supporting three full-grown men in the water, although only intended to bear two. Another object tried was a suit made entirely of reindeer hair, and covering the entire body except the face, and in which a man floated on the water without having to make the slightest movement. It was found perfectly impossible to dive in the dress. The third object tried was a door-mat made of reindeer hair, and this supported a man easily, although he was dressed in full out-door clothing. On comparing life belts made of reindeer hair with similar ones made of cork, it was found that the former were much lighter than the latter—a very important advantage to an exhausted drowning person when he has to put it on in the water. Herr Moller's assertion that reindeer hair is capable of supporting a weight ten times its own was fully borne out by these experiments. It should be pointed out that jackets, belts, etc., made of reindeer hair are soft and pliable, and that they impart a good deal of warmth.—*London Iron.*

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KOWBIS—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Pota h.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,
DR. E. A. SCHNEIDER.

University of California, College of Agriculture.
BERKELEY, Nov. 20, 1886.

Dr. J. KOWBIS, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

McLean's Orchard and Field Cultivator.

PATENTED AND MANUFACTURED BY

N. McLEAN, Watsonville, Cal.

This Cultivator has been in practical use for the past four seasons, and its popularity is increasing with farmers of all classes. It is the acknowledged superior of any other machine of its class, and long since passed the experimental stage, as its many merits and growing success attest. With the exception of the pole, it is entirely constructed of the best iron and steel, thus making it impervious to sunshine or rain. Many attempts have been made by other makers to improve on the McLean Cultivator, but their efforts have failed, and it remains the superior of all competitors.

" Canada.....	4	Total from other places.....	76
Total.....	76	Grand total.....	260

43,000 acres of Vine, Fruit, Olive, Fig, and Farming Lands, being the balance of the Company's property, are for sale at \$10 to \$35 an acre, on same terms—1 cash, balance in four equal payments on or before 2, 3, 4 and 5 years; interest, 6 per cent per annum.

Parties who have purchased are building, fencing, planting olives, vines for wine and raisins, fruits, figs, wheat, oats, barley and all other products adapted to the soil and climate.

These lands are located in San Luis Obispo county on the Salinas river, and are traversed by the Southern Pacific Railway for 16 miles, affording near market to all parts. All lots have timber for domestic use, and good water at 20 to 40 feet. There is living water in springs and streams on many tracts and sufficient rainfall throughout, requiring no irrigation.

A Grand Horticultural Event.

We have received a note from W. H. Ragan, secretary of the American Horticultural Association, stating that it is definitely decided to hold the annual meeting of the society in Riverside, beginning February 14, 1888. This event has been under contemplation for a long time, and several California towns have sent invitations to the society to accept their hospitality. Riverside has captured the distinction, and will, we have no doubt, wear it gracefully. Riverside can do a great thing when the people really try to be hospitable and to make a full display of productions. It is some years, however, since Riverside has done her best in this direction, and if the coming occasion awakens the zeal and interest of the people, we shall have a meeting and fair the like of which has never been seen in this State or in this country.

Secretary Ragan writes in his announcement: "Perhaps no point on American soil could have been selected for this meeting which would have offered greater attractions to horticulturists than Riverside in particular and Southern California in general. Eastern horticulturists should avail themselves of this rare opportunity of visiting California." The society has a large membership in the Eastern States and Canada, and it is estimated that 100 or more may make the California trip.

Riverside proposes to make the meeting of the American Society the occasion for holding a citrus fair to which all the State will be invited to contribute materials. We trust the invitation will be accepted as far as possible. It will be too late in the year to show the fruits for which the upper part of the State is famous and we imagine a little too early to show the Southern oranges in their best condition. They will, however, be gorgeous so far as appearance goes. The preserved and dried fruits, nuts and other imperishable products are now in such great supply that a good show can be made at almost any date.

We understand that the excursion tickets which will be issued to attendants at the meeting will include also a visit to the upper part of the State. The members should not be content with seeing only one part of the State. There should be an adjourned meeting of the society at some point which will welcome the organization, say at San Jose, at Sacramento, in this city or at some other point. This will give the

fruit-growers of Northern California an opportunity to welcome their Eastern brothers and discuss with them matters of mutual interest. We hope this course will be found practicable.

CHRYSANTHEMUM FAIR.—An exhibition of chrysanthemums was given last month in S. F., in aid of the Woman's Exchange, which deserved a much more elaborate notice than we were able to accord it. The show took place in the same store, on the ground floor of the

Government Aid for Irrigation.

It is telegraphed from Washington that Senator Stewart of Nevada has prepared a bill, which he intends to introduce, in relation to the irrigation of the San Joaquin and Sacramento valleys. It provides for a survey of the water-courses of the western slope of the Sierra Nevada mountains and also for setting apart sufficient land in proper places for reservoirs. He is of the opinion that all the water flowing on

Duke of Rothsay.

The Duke of Rothsay, of whom we give a portrait, is a fine specimen of the Clydesdale breed, standing at the head of the Clydesdale Breeding Stud of the Door Prairie Live-Stock Association. He was four years old last May, was bred by James Duncan of Scotland, is recorded in Vol. 9 of the Clydesdale Stud-Book of Great Britain (No. 4974). He was sired by Gilderoy (1430), his dam being Maggie by Lofly (462). He is a stylish, showy horse, but with plenty of substance, strong constitution, good bone and excellent feet. In color he is a bright bay, with white face, and three white legs. He took a leading place in the three-year-old class in both the Clydesdale Society and the State Fair at Chicago a year ago last September, as well as at the Fat-Stock Show in November, in both of which he had a very strong competition. Last month the owners of Rothsay showed Clydesdales and Cleveland Bays at the Chicago show and won four premiums, one for each horse shown.

As there is some disposition among our farmers to co-operate in securing good blood which is, perhaps, beyond the reach of individual effort, we give a few facts concerning the organization which owns Duke of Rothsay and other fine stock. The Door Prairie Live-Stock Association at

IMPORTED FOUR-YEAR-OLD CLYDESDALE STALLION, DUKE OF ROTHSAI.

Union Club building, where the rose fair was held last spring in behalf of the same good cause. It was surprising to see what a diversified and beautiful display could be made with varieties of a single flower. There were chrysanthemums large and chrysanthemums small, with close heads and loose heads, long corollas and short, petals flat, petals quilled, petals entire and petals fringed, pure white, golden yellow, rosy pink, orange red, dark maroon and shades we cannot pretend to enumerate—a marvelous and fascinating collection to whose beauties words, however multiplied, could do but partial justice.

SECOND-CROP WHEAT.—We have received from J. W. Mackie of Tulare 10 sample heads of wheat grown on his place since the middle of July. He put some straw over a patch of potatoes to retain the moisture, and as much wheat as potatoes came up. The kernels are of fair size and solidity and should make bread good enough to eat. As harvest in Tulare comes in June and early July, it seems that two grain crops a season are possible in that county.

the western slope of the Sierra Nevada mountains will be needed in a short time for irrigating the valleys, and he thinks that now is the proper time for the Government to survey the country and ascertain to what extent it can be irrigated and what streams can be made useful, and that now is the best time to make reservation in the mountains for sufficient land-storage reservoirs.

This ground has been already pretty well covered by the years of investigation which our State Engineer has made, and concerning which he has prepared most elaborate maps and reports. We suppose the point in Senator Stewart's movement is to get the United States to do the work with especial reference to the setting apart of Government land for storage reservoirs, and this, probably, can only proceed upon survey and report by United States engineers. The proposition is, so far as we understand it, a very important one and should receive attention.

A DEVON cow took the first prize at a dairy test at a late fair at Toronto.

Door Village, Indiana, was originally established for the purpose of improving stock of its individual members, and also that of the surrounding country. It was organized in 1873 by a body of farmers, all in comfortable circumstances, and it was the original aim to obtain stock from which each member might breed. It was not until 10 years after that any great changes were made in the direction of an extensive stud. Some of the heavy strains, intended more especially for draft purposes, and also carriage horses, were decided upon, and, after considerable canvassing, Clydesdales and Cleveland Bays were chosen, and some exceptionally fine specimens of these noted breeds are now found in the barns of the association.

In 1882 the first direct importation of 43 head was made from England and Scotland. Since then four importations have been made, every invoice containing horses of the very best possible pedigree. Their stables now contain a great number of exceptionally high-rank animals, and both in breeding and in trade their experience has been very satisfactory.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Santa Ynez Valley.

[No. 2.]

EDITORS PRESS:—The name of this beautiful and extensive valley (pronounced, Santa Enes) is destined to become a household word through the whole of our country. Isolated from the world as it has been, it is only within a short period that it has been taken from the grasp of the stockman and placed before the public knowledge and broken into bits of such size as can be absorbed by the ordinary home-seeker.

Now this transition period is at hand, and ere long thousands will pour in after rubbing their eyes to think they should have been asleep all these years, and they not having known of such a vast acreage of the richest soils of California lying idle, will make haste to secure some of it for their own, and happy will all those be who do secure some of it while the reasonable period lasts.

This region of country so lately attracting attention is close to Santa Barbara, only the Santa Ynez range of mountains intervening between it and the Naples of the Pacific Coast. This range, constituting the southern boundary, running due east from Point Conception, becomes merged into the Coast Range proper; and with that on the east, and the San Rafael range on the north, encircles an elongated valley of great extent and varied soils, the whole being not less than 200,000 acres, much of which is suitable for agricultural and horticultural purposes. The valley has, properly, two portions; that lying near the ocean being the lower or Lompoc valley, and the main upper valley the Santa Ynez.

Access to this valley has hitherto been only by stage and wagon-road from the sea. Now, however, the extension of the narrow-gauge railroad from Los Alamos, some 12 or 15 miles, brings the traveler to one arm of the Santa Ynez valley, called the Ballard valley, in which is located the terminus Las Olivos.

But very soon a far greater influx of travelers and settlers will flow in through the completion of the great through route of the Southern Pacific railroad, whose survey stakes have been seen for some time, and which will very soon be covered by the ever-progressive graders, and almost in a day the rails will be laid and the locomotive be speeding across the valley. Then this isolation will be a thing of the past, and the health-giving properties, the beauties and fertility of this region, become known to the world.

If you travel the whole length of the coast of California you will find but this one valley that has a main course of due east and west, and protected on the north and on the south by mountain ranges which insure safety to crops and comfort to the person from the dry and desiccating north winds, and from the severity of the storms from the south, while at the same time receiving the gentle health-giving breezes of the ocean tempered gradually from the moisture of the seaside to the dry and comfortable air of 50 miles of valley in its hardly perceptible ascent of 30 feet to the mile. Through the middle of this long valley in some places, and to the side of it in others, courses the Santa Ynez river—a stream never going dry and receiving very numerous side streams from well-watered mountain ranges, which insure to all this region ample moisture to the soil for all crops; consequently artificial irrigation is not required. Near the sea this valley is broad and damp. A few miles up, the hills of the San Rafael range on the north and the Santa Ynez on the south approximate, and a certain protection is given to the main upper or Santa Ynez valley from the rawness of the ocean air. From this point at the western limits of the great Buell ranch (San Carlos de Janata) on the north of the river, and the no less fertile possessions of the De la Cuesta family on the south, the valley widens, a portion of which, because of its being a level plain, is named the

Llanos Grande

(Pronounced Yanos), or Big Plain, of the Santa Ynez. This embraces some of the most fertile and valuable soil known in California, producing every known crop, and, as may be seen in the orchard of the De la Cuesta family, all the temperate fruits in the most lavish profusion without irrigation.

The subterranean, as well as the surface, flow of the river here gives such moisture to the soil, while being well drained, as enables it to produce from the seed and bring to the fullness of a perfect maturity everything which the husbandman may choose to plant, and to a perfect growth of tree and shrub everything the nurseryman may cultivate. The soil here is of the very richest character, a dark loamy ash sediment of unknown depth, of such softness and ease of manipulation as would delight the lazy plowman and old family horse who might come from a more inhospitable clime and tougher soil to luxuriate in the plenty here to be obtained with the minimum amount of labor. This is the kind of soil we have just been reading about where the great \$150 prize five-pound onions and man-size beets, and 250-pound squashes were produced. If the farmer wishes something more attractive and drawing, let him sow the tiny mustard-seed, which will return him a ton to the acre and

bring two to three cents per pound waiting for this crop to mature; the only difficulty the lazy farmer and his sedate horse will have will be to break his way through the mustard-stalks, which are higher than he can see over, standing up in his buggy while on the way to the country grocery-store.

On the north of this rich tract is one of the main highways from San Luis Obispo, and not far from here are valuable hot springs, which enterprise will develop. On the south is the

Cuesta Canyon.

Called Gaviota pass on the other side, through which the Southern Pacific R. R. is soon to make its way. The late Dr. De la Cuesta, a marked representative of that pioneer class of old and pure Spanish families, looked with admiring eye upon the goodly country debouching from the foot of this pass, the only natural one through this portion of the Santa Ynez range, and upon a garden spot of 8000 acres built his home, and with his excellent lady spent many happy years, raising a delightful family of children, numbering 11, who continue to entertain in the most hospitable manner, according to the example set by their lamented parents. Their mansion-house is of durable adobe, but, possessing such rubber-like elasticity that 20 persons are often entertained, with such profusion of table that no less than a whole calf roasted a la barbeque will suffice for a supper and breakfast, and seasoned by the entertaining conversation of the four delightful daughters of the house. Is it a wonder that any who taste the hospitality of this charming home should cherish it in remembrance? Should you need exercise while their guest, a trip is taken up their canyon to the Honey-moon falls, otherwise known as the Nojoqui falls—pronounced Nok-ko-wee. Here, in this picturesque canyon, is a place where the water falls in spray some 200 feet, amid mosses and ferns, and then hurries on after this display of beauty to its useful purposes in the valley below. To the tourist, this canyon will, in the future, be one of the lovely and grand sights of his transcontinental trip. All these hill and mountain slopes are well wooded, as are they well watered and grassed. Live-oaks of enormous size and girth are a prominent feature of this landscape. Some three or four miles east from the De la Cuesta home the mesa lands from the north come down to a rounded point near the river, and upon this mesa stands the old mission, Santa Ynez. Religious services are still held here occasionally. The mission should be restored and be permanently a prominent feature of the grandest natural site for a town that the valley possesses.

Prospective.

It is thought by those most competent to judge that the main town of the valley will be here located, as it possesses every valuable requisite of gentle elevation, rich and well drained soil, extensive views of the grandest scenery, the purest atmosphere, and the greatest facilities for a perfect sewer drainage—a fact which so seldom enters into the calculations of town-site proprietors. It is certain that one great town will become the center of business for this great valley, and this would seem to be the natural location for such town. The fathers who located the mission at this place made no mistake in their choice. From this point, as the hub of the wheel, radiate various arms of valleys from the main valley which spreads out in vast extent to the east. We should consider here from this point east the main valley to consist of level-bottom valleys and more or less level and rolling mesas—these meaning lands that are elevated above the valley bottoms. While sitting in the buggy near the old mission, behind a pair of fine steppers and beside that genial gentleman General Willey, who took it upon himself to show me some of the beauties of this great valley which is his great delight, we hardly knew in which direction to go first, for all directions from this point are so attractive. Finally, setting our horses' heads up the river, we passed through the Selby place and on by the ruins of the first woolen-mill ever erected on this coast, and which was built by the Mission fathers. Although but a few adobes now show where this enterprise commenced, evidences are on every hand that vigor and industry were characteristic of those brave old men. Here a most remarkable stream of the purest water flows into the main river, which has arisen from large springs breaking out of the valley lands near the town of Santa Ynez. Not far from here is the old college building and chapel, erected and used for years by the Catholic church on a large grant of land of 35,000 acres, belonging to that church and called the College ranch. This property has heretofore been withheld from sale, but has recently been purchased by the Santa Ynez Land and Improvement Co., and is now being surveyed into small tracts and offered for sale in amounts and at prices to suit all buyers. The gentlemen composing this company are well known throughout the State and of ample capital to carry through to a successful completion all the enterprises they may undertake. The two members of the company in charge here are E. W. Steele, Esq., of the Steele Bros., and ex-Surveyor-Genl. H. I. Willey, who are uniting in their efforts to open up to settlement these old but hitherto locked-up lands. They are now using the old college as their headquarters, and being but a little way from the postoffice town of Santa Ynez, is very convenient. Continuing our ride, we pass through the town of Santa Ynez and

bowl along over the best natural roads I ever saw, skirted by vast wheatfields up the valley, taking the main stage route to the San Marcos Pass, which leads directly over to the city of Santa Barbara. For miles and miles, as far as the eye can see, the College ranch is dotted over with great white oaks, and here the person is indeed hard to please if he cannot find some land to suit his wishes and purse.

Topography.

The capabilities of this land I intend to dwell upon further along. There are valleys and rolling lands and low hills of a rich, gravelly loam, suited not only to the growth of the cereals which never fail to yield good crops of the best of grain, but which are destined to be devoted very largely to the growing of the olive. In our ride, we cross numerous small streams and go up the valley many miles, when, as time warns us, we must head in another direction, so we circle about and return by another road to Santa Ynez, and then out to the north, where, ascending a knoll that is a peculiar landmark of the valley, we are entranced with the unexpected view here obtained of the vast amphitheater of valley and surrounding mountain walls miles away in every direction and encircling in their protecting embrace all excepting the outlet to the sea. From this vantage point it is easy to see and understand what General Willey pointed out of the vast watershed pouring its treasures down from every side to give to the rich soil the vivifying influence, and which only needs the cultivation of man to make blossom as the rose. Ten miles to the northeast of where we stand, on the summit of the San Rafael mountains is a marvelously beautiful lake, Ziaa it is called, of some 30 acres in area, of unknown depth and surrounded by magnificent oaks and pines, making it a most lovely spot to visit. Seeing this vast reservoir at such an altitude it is easy to believe that artesian flowing water could be obtained anywhere in the valley by sinking wells to a moderate depth. The enterprising gentlemen in charge of this great land company intend at no distant day to test this supposition. Riding down the northern slope of our lookout knoll, we take the road to the Ballard valley, which is a fertile arm of the main Santa Ynez valley and in which is located the hamlet of Ballards and still further up the site of the new town of Los Olivos, seeing on our way to the right the large olive orchard of the Boyda. If we now turn southwest again we will pass successively through the domains of a most pleasant English gentleman, Mr. Henry D'Urban, whose mansion is nestled under some of the largest live-oak trees to be found in California, the possessions of Louis Janin, Esq., of San Francisco, the Hayne Bros., who are the pioneers of the olive industry as such in the Santa Ynez valley, and on to the old Mission again. These gentlemen named have orchards which will be described in another place. To the right and north of the Llanos Grande valley of the Santa Ynez, in the hills, is another very fertile valley called the Ballard field, where is to be found a large extent of fine farming land. All this portion of the Santa Ynez main valley on the north of the river is comprised in the Buell ranch, the very cream of which the Santa Ynez L. and I. Co. own. Having now made a small circuit of the valley—which, let it not be supposed can be made in one day, for it required two days under the guidance of Gen. Willey to investigate only in part—we will turn from the topography of the valley to its climate, only calling attention to the vast acreage of tillable and fertile land here to be found comprised in a few large ranches, amounting to 50,000 acres. Of these, the San Carlos de Janata or Buell ranch and the College ranch—Canada de los Pinos—furnish a large portion of the lands of the great valley.

A more attractive region or a more valuable one cannot be found in the State, and no region will hereafter be more eagerly sought than this for its many advantages of beautiful location, climate and productive capacity.

Climate.

The temperature of this valley is more even than that of Santa Barbara, in so far as its effects are discerned by the sensitive person; so many who feel the slight chill of the immediate sea air can here find that delightful balmy atmosphere formed by the admixture of sea and interior air that is so comfortable to the person and so soothing to the sensitive air passages. Indeed, so healing and so enjoyable is this balmy air that many invalids have here regained health and have no dread of the most vigorous outdoor employments. For benefit to asthma, bronchitis and phthisis no superior climate can be found for those who do well in proximity to the sea. As one gentleman remarked to me, he had hunted the State over for a perfect climate; not north, not south did he wish. The rawness of the north was too much, the enervating moisture of the south was too trying, the heat of the far interior too great. Coming here, the combination of all the excellent qualities of climate gave him what he desired, and he here cast his fortune and "put all his eggs in one basket." The moderate altitude secures an even, dry and pleasantly sustaining atmosphere, not too cold in winter and not too hot in summer, the warm morning air of summer merging into the gentle tempered sea-breeze stealing along at about 11 o'clock and subsiding at sundown. In this dry and even-tempered air the most exquisite comfort is experienced, and man and beast and plant all equally flourish. This

is the haven of rest to the tired invalid, the pleasant tonic to the vigorous worker.

In my next I will treat of the agriculture and horticulture of this Santa Ynez valley.
Auburn, Cal. S. F. CHAPIN, M. D.

THE STOCK YARD.

Color in Shorthorns.

EDITORS PRESS:—I am a firm believer in the fact that a good animal is never of a bad color.

There has been and still is a senseless and unreasonable prejudice against all colors in Shorthorn cattle but deep red. Fortunately, however, this prejudice has never taken deep root, if any, among the largest and best breeders. I say fortunately, for if all breeders should use red bulls only the majority would have to use middling or inferior animals. A breeder who knows his own mind and is aiming to build up a herd of a fixed type or style, cannot be altogether confined to using bulls of any one color, yet he must not be altogether regardless of color, for all breeders have cattle to sell at some time or other, and it is well to bear in mind the wants of buyers.

I do not think there are any grounds for the prejudice against pure white or a mixture of red and white in any degree of color among Shorthorns. Neither do I believe that red cattle, taken altogether, are as good as those of mixed colors, or pure white even. There are plenty of facts to prove that the white, red and white and roans hold their own, both in sale and show rings, but more especially in England than in the United States. At the same time I admit that a right good color helps to sell an animal, but I have never in my experience found that a good roan would not sell full as well as a red one, and I have always found sale for any white bulls that I have reared. In making sales from my herd I have several times had white bulls taken in preference to some of other colors—red not excepted—not because of the color, but rather because of the superior size and quality of the animal itself.

It is not necessary to go back to the days of Chas. Colling, whose roan bull Comet sold for 1000 guineas (more than \$5000), in the year 1810. Higher-priced bulls have since been sold, but the fact remains that the highest-priced bull ever sold—of any breed—was a roan Shorthorn, the celebrated Duke of Connaught, bought by Lord Fitzhardinge, in 1875, at the Earl of Dunmore's sale, for 4500 guineas (very nearly \$23,000); and "at Berkeley he did great service and was the talk of the country. Many of the best cows in England were sent to him at a very high fee; indeed, his cost price was said to have been returned in less than five years." Calved August 10, 1874, he was useful up to March, 1886, when he caught a severe cold from which he never recovered.

I had the pleasure of seeing this fine bull in 1875, and then thought him nearly (but not quite in one or two points) perfect in shape. He proved himself to be a most impressive stock-getter.

Two years before the sale of this high-priced bull, the great sale of Shorthorns had taken place at New York Mills, where the highest-priced cows ever sold were bought to go to England. A red and white cow was knocked off for \$40,600, but was afterward sold to Col. Morris for \$30,000, so that Earl Bective's purchase of the roan 10th Duchess of Geneva for \$35,000 was in reality the highest price paid. This cow proved to be a profitable investment at the very large price paid for her.

At the sale of the late Mr. J. B. Booth's herd in England, about a year ago, 40 cows and heifers, including calves, made an average of \$500—the highest sale average of the year. From the English Herdbook I have got the colors of 32 of them, four of which were red and three of these among the very lowest-priced animals in the sale; as usual, a roan cow sold for the top price of the day.

Twenty-seven head of the leading prize-winners (male and female) at some of the best English and Scotch shows in 1887 consisted of 18 roans, 6 red and white and three white animals.

There are not many pure-bred cattle of any breed made up for the fat-stock shows, but all who are interested in cattle matters will remember reading of the white, pure-bred Shorthorn steer from the Bow Park herd, exhibited at the great American fat-stock shows a few years ago. He was one of the very few steers, and I believe the only pure-bred one of any breed, exhibited every year of his life, and never beaten in any ring in any year. A white bull was sold for \$500 at Kansas City last spring.

It is but a short time since I heard the remark that it was no use showing roan animals in America. Those that attended our last State Fair at Sacramento may have seen some reason for thinking differently, and if that is not enough, we will just state that at the Illinois State Fair this year a Shorthorn herd of four roan cows with one red bull took the \$500 herd prize, beating "seven other herds from five different States, and representing as good specimens in the Hereford and Polled Angus classes as are to be found in America"—so says the *Stock Journal*; also that a roan Young Mary two-year-old Shorthorn heifer took the first

premium over eight red competitors at the Ohio State Fair this year.

I have endeavored to set forth a few plain facts about what animals of the lighter colors have achieved in the way of prices as well as prizes, and I cannot conclude better than to give an extract from the *Chicago Stock Journal* on the color question, written by an English writer, who has the following on Shorthorn colors, which coincides with my own views on the subject and experience also:

That white implies weakness of constitution is a theory most thoroughly exploded by frequent exposure. Take, for instance, only the illustrative instances of the swan and white bear, and the vicissitudes of severe weather to which they are respectively subjected without harm. No one can say that the white cow fails on the score of milk—they are usually most excellent at the pail—or that the white bullock is backward in laying on meat. What can be the cause of such a senseless prejudice, then?—a prejudice, too, which is so detrimental to the best interests of the breed; inasmuch as to comply with the requisition of your market, men are scared from using a white one, either male or female; so that a large quantity of the best possible material falls out of use, and so, eventually, a considerable element of the very best will be lost. The white cow is very apt to bring a roan calf. From that point of view, then, damage is done by tabooing, and so eventually obliterating the whites.

It is not the extermination of the color that I deprecate so much as the great amount of inherent, long-descended excellence that that color indicates, and which must be ultimately lost unless we can stem this mighty tide of prejudice. Then that best of colors, most beloved of old breeders, the "yellow-red," is also being tabooed. There is no doubt that cattle of this hue give the richest milk, and the brothers Colling were especially fond of such. I have myself known some whose yield was as golden as that of the Alderney, and far more abundant in quantity. This, again, is an unreasoning prejudice. And yet the modern buyer will not look at an animal of the color. He wants dark red, very beautiful, no doubt, but suggestive of a black infusion at some date, or roan he will take, especially the "blue roan" of the Bates school, which I have never known to occur among Booth cattle. The Booth disciples have their roan, but it is a yellow-red roan. The same tint was found at Towneley and prevalent at Fawley. Both Col. Towneley and Sir Charles Knightley, be it remembered, used much Booth material. Then, again, you do not get the black nose at Warlaby or Fawley. How comes it among the Bates families? As I think, in tow of the "blue-roan," however, that really may have been introduced. Undoubtedly, where the blue roan is found, there, too, black noses turn up. The Booth cattle were somewhat indebted to the "alloy." The Galloway (a red polled Galloway), from which the "alloy" came, is singularly free from all nasal stains of any sort, and they, too, have no "blue roans" among their cattle. I do not remember a single instance of that color occurring in their herds. Yellow roan and red roan they have, but no trace of blue. After all, can a really good cow be of a bad color—that is, provided she have shape and quality? I hope our breeders will disregard a childish cry, and breed their cattle as they come in respect to hue. There is a stream of people who follow fashion and the public cry. They may increase our difficulty, but I do hope we shall not lose the famous and beautiful white.

There are very few of the yellow-red Shorthorns in this country, but what there are of them are good, giving plenty of rich milk. Those I have of that color get the yellow from a roan bull that I brought from England in 1861, a descendant of Sir Charles Knightley's stock, mentioned above. Some of his calves were yellow-red or yellow-roan, all of which were fine, large cattle and good milkers. It is not long since the last of his get went to the butcher, hale, strong and fat in her nineteenth year—proof of that strong constitution which all good Shorthorns should have.

ROBERT ASHBURNER.

Salt for Stock.

EDITORS PRESS:—An impression seems to prevail among stockmen in this State that stock do not require any salt, and I have often heard the remark that they would not eat it if given to them. This, I think, is a mistaken idea. All animals not only relish salt, but absolutely require it in order to promote a healthy condition of the system. Poultry require less and milch cows more than other animals. Even honey bees relish and devour with avidity an occasional ration of salt. If flockmen would give their sheep salt and sulphur, mixed in the proportion of three parts of salt to one of sulphur, I know they would not be troubled with ticks, and I am persuaded they would not be troubled with scab either. Many experienced herders with whom I have conversed on this subject agree with my views about this matter, too. I have fed salt to cows in this State where complaint was made that they were failing in their milk and that it took a long time to churn the cream from their milk. In every instance the cows ate the salt with avidity, and there was a marked increase in the amount of milk they gave, and there was no more complaint about the butter not coming soon enough.

I have been surprised to hear intelligent persons give, as a reason why stock did not want and would not eat salt, that there was plenty

of salt deposited on vegetation from vapors arising from the ocean! Every one ought to know that not a particle of salt or any other impurity is ever exhaled from the ocean. In the immediate vicinity of the ocean salt may be deposited on vegetation and other things from the spray carried by the wind, but none is ever taken up by the process of evaporation. Horses that are constantly kept in the stable should have their regular weekly allowance of salt, sulphur and wood-ashes. The same should be given to fattening hogs shut up in a pen.

Santa Rita.

J. S. TIBBITS.

Horns and Handling.

EDITORS PRESS:—In your issue of November 19th Mr. Ashburner says: "I never had a vicious bull nor ever had the handling of one."

The commonly accepted meaning of the word "vicious" as applied to a bull is wicked or unruly. I suppose Mr. Ashburner's bulls are much like other people's—not vicious if they are restrained from becoming so.

My experience has taught me that most bulls when they arrive at the age of 15 or 18 months are inclined to be vicious, and would be so if they were not properly handled.

If they are handled as they should be until they are three years old, they become more tractable and afterward there is not as much danger of their becoming vicious. Their temper is variable, and there is no certainty that their inclination to viciousness may not assert itself at any unguarded moment. For this reason they should always be handled carefully, firmly and gently.

If dehorning a bull is sure to work so radical a change in his temper that he will not be inclined to be vicious, I would say, "Off with his horns;" but unless it does that I would prefer to have the horns left on the bull's head. I often find the horns a convenience in handling a bull, and when he is inclined to be vicious he can deal about the same destruction without horns as with them.

I would not trust a vicious bull merely because his horns had been sawn off, for the power for mischief is still in his head.

POULTRY YARD.

Marketing Eggs and Poultry.

The producer can often get useful hints from the merchant's views of preparing products for sale. From the *Grocer and Country Merchant*, a journal well informed on trade affairs of this city, we take the following hints about marketing eggs and poultry:

Eggs.

There is probably in no one article of the same relative value, so much loss from injudicious management as in eggs. This is best illustrated in the Eastern trade. Some shippers will gather up in small lots a sufficient quantity to make a shipment to this market; having the amount on hand necessary to make a shipment, they search the store for old boxes, barrels, etc.; anything that will hold the eggs, in their judgment, is good enough. It always pays to pack eggs in cases or egg-carriers; they are uniform in size, self-counting, no experienced packer required, clean and convenient to handle, only a small space required to pack them, will carry eggs much safer than any other package, scarcely any loss by breakage, save in freight, and they go into market much cleaner. Railroad employees cannot roll them about as they do barrels; and the best and above all, eggs in cases bring from 2¢ to 5¢ cents per dozen more than in any other package. Why is it our market reports are always quoting eggs with such a wide range in prices? Simply because of the injudicious management and unskilled handling. In packing, make two grades of eggs, that is, fresh eggs; keep the clean ones by themselves, and the uncouth ones the same. A little fresh, thoroughly clean and perfectly dry straw, or if proper straw is not obtainable, several layers of clean, dry paper, should always be put in the bottom of the box, and also next to the lid. The straw or paper serves as a cushion and tends to prevent breakage. Stale, dirty, damp or musty hay or straw should never be used, as it not only injures the appearance, but affects the quality of the eggs. Care should always be taken to prevent eggs coming in contact with any foreign odor. In shipping a long distance be sure that your eggs are not only sound but recently laid. Eggs may be candled and repacked, but if they are stale, though apparently sound, they will be sure to reach this market in bad order, or will so rapidly change that dealers will be sure to lose money on them. This rule is especially applicable to Eastern and Salt Lake shippers; the motion of the cars so muddles eggs not entirely fresh that they appear cloudy, stale and will soon spoil, if, indeed, they are not already bad. Do not hold lots after they are packed. Ship at once while fresh.

Dressed Poultry.

Food in the crop injures the appearance. Purchasers object to paying for this worse than useless weight. Therefore always keep from food 24 hours before killing. They should, however, have all the cold water they can

drink, as this makes the meat white and firm. Opening the veins of the neck and bleeding in the mouth are the best modes of killing. Never cut off the head unless the process of killing should injure the appearance. When such is the case, the head should be taken off at the throat, the skin peeled back a little and a portion of the neckbone removed, the skin then drawn over the end and tied and trimmed neatly. But it is in no way necessary to cut off the head, if properly managed. For instance, hang the fowl up by the feet, lock the wings and bleed with a sharp penknife, as above noted. Leave the feet on also. The intestines or the crop should not be drawn. And it is very essential that you should never scald your poultry when dressing for this market. Buyers always prefer dry-picked, and such lots will always command the market at higher prices. Poultry looks much cleaner when dry-picked than when scalded. Then, again, the peculiarities of our climate seem to produce discoloration very quickly, when scalded. This is one reason that Eastern stock invariably sells at discount. Another reason is, that buyers prefer the feet and heads left on. You cannot be too careful in observing all the minor wants of the market, if you expect the best market price for your poultry. Have all the pin-feathers, etc., removed very cleanly without breaking the skin. This can be done if proceeded with at once, while the fowl is warm.

Pack in light but strong cases to contain 200 to 500 pounds; also ship some 100 to 150-pound cases to supply small buyers. The larger-sized cases, say 300, 400 and 500 pounds in each case, are suitable for festivity days. Ordinarily, cases containing 100 to 200 pounds are preferable to the trade. The cases should not be over 18 to 24 inches deep, to prevent pressing the fowls out of shape. Do not pack until the fowls are cooled through; if packed when warm inside, they will be sure to spoil if long on the way. Pack closely as possible, lining the package with clean paper, and see that the package is so full that when the cover is nailed on there will be no chance of the poultry being moved about. In packing turkeys, pack gobblers breast up, and hens back up; appearances of packages are thus improved. Never use straw in packing poultry, for besides creasing the bodies, there is always more or less chaff that hurts the appearance of the fowls. Our best markets for poultry are Thanksgiving (generally the last Thursday in November), Christmas and New Year. Turkeys sell well on either of these occasions, but best on Christmas—especially large ones. Care should be taken that lots shipped for these occasions should arrive in sufficient time before the event to meet the best sale.

Live Poultry.

Give live poultry all they can eat and drink before shipping. Avoid putting small and large ones in the same coop, especially if crowded. Never put chickens in the same coop with turkeys, as the latter trample them, and are liable to kill some. When possible, assort so as to have each coop uniform in quality. It is a great mistake to suppose that a few choice, fat chickens mixed in with a lot of small and sometimes poor, scrubby chickens, will sell to advantage. In fact it more often detracts.

Turkey coops should be say 20 inches high by 6 feet long and 2½ feet wide. Chickens, 16 inches high, by 2½ feet wide, by 5 feet long. And in every instance it is very essential that the slats should be upright, so as to be convenient in watering. Have the coops light but strong. Large young roosters and ducks have the best sale for the Chinese New Year, occurring about the 1st of February; as their calendar differs from ours, it is impossible for us to name the exact date. Geese sell best during the Jewish holidays.

THE VINEYARD.

On Vine Pruning.

EDITORS PRESS:—I have often thought that the grape and wine industry don't receive its share of the space in the *RURAL PRESS*, and to give a good example I send this in reply to "Vine Grower's" letter in the *PRESS* of Nov. 12th. If any of your readers ever pruned his vines before the leaves were shed, let him give us his experience.

The main reason why I would like to know is this: Supposing a man had a large vineyard and wanted to prune it all himself, how soon would he begin? I have often noticed that in places where a shoot was broken in picking, and sometimes split in halves, buds almost on the edge of the break will send forth good healthy sprouts in spring, but I never pruned vines before they were dormant. "Vine-Grower" seems to think it injurious for a vine to bleed. It is my opinion that this blood is little more than clean water, and that late pruning has no other effect than to keep back the sprouting of the buds for a week or two. As to painting over the cut ends, I would say that in pruning grapes the cut is mostly made about half-way between two buds, and the piece of shoot between the cut and the extreme bud dies and no amount of paint can keep it alive. Of course the cut could be made so close to the bud that no dead wood were left, but who will know where that place is every time? If you cut on one side you will injure the best

fruit bud on the spur, and if you cut on the other side there will be a dead piece, and it might just as well be two inches long as an eighth of an inch. With the usual system of back pruning the whole business will most likely be cut off again next year, so that it makes little difference whether the cut has healed or not.

When you have to cut off a thick branch, cut it off smooth, or even cut a piece out of the main plant, and you will find it to heal better than if you leave a knob sticking out and daub it full of paint.

Mr. "Vine-Grower," do us the favor of pruning a few of your vines at once; apply the paint to the roof of one of your buildings, and next year let us know the result.

G. G. Green Valley, Sonoma Co.

Vine-Pruning.

EDITORS PRESS:—"Vine-grower" of Redwood City in your issue of Nov. 12th gives his experience in pruning vines last winter in January and February, when he found that the vines bled after cutting, and asks whether it would be doing the right thing to prune them now while they are as dry as a bone.

Vine-pruning may be done, speaking generally, at the time after the ripening of the wood down to the time when the vines commence to bleed. The only objection to early pruning is that it will cause the vines to start two or three weeks earlier in the spring, and the new shoots are liable to be nipped by the frost. Late pruning is the rule for localities which are subject to late frosts. The theory is that the sap which would otherwise have but little force in any one bud, if acting upon a large number at once, as would be the case before any are removed by pruning, it would have a very powerful effect if concentrated upon but a small number, and would cause them to start a good deal earlier than they otherwise would. If your correspondent's vineyard is so situated that there is no danger of frost after the buds start in the spring, there is no objection to his pruning as early as the middle of November, except that the eyes left on the spurs are a little more liable to be injured by winter frosts than when a long cane is left to be pruned off later.

Although most writers are afraid that the bleeding of the vine may be injurious, the celebrated Dr. Guyot, a man whose opinion was of great weight in France during his lifetime, and whose writings survive him, believed that the bleeding did little or no harm.

However this may be, it is safe to say that in a locality where the early shoots would be caught by a frost, the injury done by the frost would far exceed that which might possibly be caused by the bleeding of the vines.

The same inquirer also wants to know if it is a good plan to paint over the wounds or cut ends made in pruning. In a large vineyard this is impracticable except to a very limited extent, and he will very soon find that it is entirely unnecessary, because the first cuts when the vine is young will readily heal and in subsequent prunings the old wood with the cut on it will mostly be removed. In changing the form of an old vine, in reducing its height, etc., when it is necessary to make a large cut, it would be useful to cover the wounds, for these ought to heal as soon as possible.

E. H. RIXFORD.

San Francisco.

Vine Pruning.

EDITORS PRESS:—In answer to "Vine-grower," Redwood City, in your issue of Nov. 12th, I would say that it is practically impossible to prune a vineyard in California without subjecting the vines to more or less bleeding.

The vines might be pruned just after the crop is gathered, as suggested; it would do no harm. Of course it must be remembered that the earlier a vine is pruned, so much earlier will it start in the spring.

As the vine is cut midway between two buds it would be useless to paint over the ends.—LEONARD COATES, Napa.

LUMBER TRANSPORTATION ON THE MISSISSIPPI.—Lumber is rafted from La Crosse, Wis., to Hannibal, a distance of 300 miles, for 75 cents a thousand, and in times of high water often as low as 50 cents a thousand. From La Crosse to St. Louis, a distance of 450 miles, the charge is 85 cents a thousand, no charge being made for deck loads of shingles and lath. Lake dealers have to pay three and even four times these rates. There is no quoted rate from any lake-producing point to this city less than \$1.62½, where figures run up to \$3.25. In addition to this disadvantage, the Chicago dealers pay higher rail rates to reach their Western customers than the rivermen have to do. It costs them \$1 a thousand more to pile their lumber in their yards than it does the dealers on the river, and after the lumber is in pile it occupies much more expensive ground here than at St. Louis. There is all this in favor of the Mississippi-river lumbermen, yet competition laughs at the handicap. When the Chicago dealer desires to place lumber in territory west of the Big Muddy, he knows that his river competitors have from \$1 to \$1.50 the start of him. Yet he goes out there, the Mississippi man finds, crowded in a manner that annihilates all profits. It is surprising how they do it, but they do!—Exchange.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Our National Grange Display.

From reports already received from the National Grange, it is evident that California, and especially the Grange, will receive great credit, and such as must result in permanent benefit, from the display at this session. Its further display in Chicago will also render more than value paid for the enterprise of the donors, Patrons and friends of agriculture who actively assisted in contributing, transporting and placing the exhibit so successfully.

Hundreds, if not thousands of Patrons, all over the Union will remember with good opinion California and her rare productions. We shall be mistaken if many Grangers are not attracted to California, and put in their application for affiliating as one of the best and first things they can do on arrival upon our sunny shore. And may not thousands of coming farmers to California be, by ocular demonstration at the National Grange, and through reports of the show of the products of our California soil and climate, be induced to join the Grange as one of their early acts?

For Discussion in the Grange.

Among subjects which may be appropriately discussed at the celebration of the Grange's birthday, the following occur to us:

What can be done at once to thoroughly revive the work of the Order in our county and State?

How to manage our county and district picnics so as not to interfere with each other in time of holding, etc., and yet increase their enjoyment and benefits.

Shall we hold a State or Interstate picnic in California? When and where?

What is the best date to be established in this State as Arbor Day? Would not Grange birthday be the best, and can we not consistently ask the Legislature that it be made a legal holiday in California?

What is the best method that can be devised for nominating and electing town, State and national officers, in order to secure the best public servants possible?

It would also be well to read extracts from the proceedings at the recent meeting of the National Grange, and exchange views and comments on the sayings and doings of that important body.

A Pomona Grange in Sutter.

At Yuba City on Saturday, Nov. 19th, Butte Mountain Pomona Grange was organized by District Lecturer B. F. Frisbie. There were present members of North Butte, March, South Sutter and Yuba City Granges, to the number of 30 or thereabout, but the charter-list contained about 50 names, which will be largely increased, as the list is to remain open for 90 days. An unexpected degree of interest was manifested in the proceedings, from the opening to the close of the meeting.

Officers were elected as follows to serve through 1889: O. E. Williams, M.; Otis Clark, O.; Mrs. M. J. Frisbie, L.; R. Mahon, S.; C. C. Patridge, A. S.; Zetta Sammis, C.; R. K. Stevenson, T.; James B. Wilkie, Sec.; W. P. Smith, G. K.; Josie Walton, P.; Lena Newkom, F.; Clara Pratt, Ceres; Mary Patridge, L. A. S.

The next meeting is to be held in Yuba City, Saturday, Dec. 17th.

Amendments to the Constitution.

The following amendments to the constitution, which were handed down by the National Grange a year ago, have been adopted by the several State Granges, the vote standing 26 to 1, six States not voting:

County or Pomona Granges may be represented in State Granges under such regulations as the State Granges may provide.

The State Granges shall have authority to confer the degree of Flora on all members of the Order in good standing in their respective States, who have taken the degree of Pomona, in like manner and form as the same is now conferred by the National Grange, and each person receiving the degree shall be entitled to a certificate of membership in the sixth degree from the National Grange and duly attested under its seal.

Grange Birthday at Oakland.

The 21st anniversary of the birthday of the Grange will be celebrated at Oakland Saturday, Dec. 3d, by Eden and Temescal Granges with literary, musical and social exercises. Among the notable and eloquent Patrons who are expected to be present and make their voices heard is Bro. S. T. Coulter of Santa Rosa, whose addresses are ever entertaining and instructive. Exercises will commence at 10 A. M., and all Patrons who can attend are cordially invited.

Santa Rosa Grange.

EDITORS PRESS:—Santa Rosa Grange is to properly observe the natal anniversary of the Order. The day will be Saturday, and the program will be interspersed with songs, short speeches, select readings, a basket-dinner and so forth. None but members of the Order will be admitted.

Since the session of the State Grange at this place our Grange has had two applications for membership. All the meetings are well attended, and unless something in the shape of a terrible storm or epidemic visits us, our annual election of officers will be held at the next regular meeting, Saturday, Dec. 10, 1887.

The most important work to be done by Subordinate Granges this month is the selection of officers for the new year. Without competent and attentive officers none can hope to prosper as it should, and if Subordinate Granges are not in a flourishing condition, how can the State Grange perform the work expected of it? It does seem important that all who have the Good of the Order at heart should attend the Grange election and assist in choosing wide-awake and industrious officers.

There is some talk of reorganizing Healdsburg Grange. It is surprising that in a community so thrifty they should not have maintained their organization. Let us indulge the hope that Healdsburg will soon be honored with a prosperous Grange.

Worthy Master E. W. Davis and his wife, Sister Davis, were honored by their Grange friends with a surprise party on Friday night of last week. There were about 150 persons present, and a most agreeable evening was had. A good supper was brought by the invaders, and heartily enjoyed by all. These Grange surprises are always successes, and bring about much goodfellowship.

We are glad to note that Bro. Past Master Coulter is to deliver the annual address at Temescal Grange reunion. We promise his hearers a good speech and an entertaining and instructive meeting.

By thus setting the example, we hope to see Santa Rosa Grange items frequently reported for the press. FRATER.

Anniversary Celebration at Sacramento.

EDITORS PRESS:—Arrangements have been completed for our celebration on December 5th at Sacramento. The joint committee of Sacramento, Franklin, Enterprise, Florin and Elk Grove Granges met at Grangers' hall, Sacramento, on Saturday, November 26th, and arranged a program for the occasion, which consists of addresses by Wm. Johnston, P. M. S. G., Daniel Flint, Lecturer S. G., Judge J. H. McKune of Sacramento Grange, W. Walter Greer, Master Sacramento Grange. Remarks by the Masters of the different Subordinate Granges in Sacramento county. Speeches by prominent Grangers. Discussions on the outlook for the Order and reviews of the past.

There will be essays, recitations, readings, songs and instrumental music by members of different Granges.

The time set for meeting is 11 o'clock A. M. At noon a feast will be spread, around which all Patrons are invited to gather.

Although we expect a large crowd, we have ample room and we hope to accommodate you all. I need say nothing further only to mention the committee who will be in charge of the tables—Sisters Hamilton, Jackman, McMullen, Greer and Wilcox—which will alone assure you we will have something to eat.

The meeting of Sacramento Grange on Nov. 26th was well attended, and among those present were noted several visiting members.

When suggestions for the Good of the Order were reached, we were entertained with speeches by Bros. Welty, Flint, Hale of San Jose, Aiken, McKune, and Sisters Johnson, Aiken and McMullen.

Sister Johnson has something to say to the brothers of Sacramento Grange, which she will probably do through your columns. Anent this more anon.

W. WALTER GREER,
Master Sacramento, No. 12.

Grange Election.

SAN JOAQUIN COUNTY POMONA GRANGE.—Elected at Lodi, Nov. 19: Ed. Elliott, M.; S. W. Sollars, O.; E. J. McIntosh, L.; T. C. Shaw, S.; S. O. Waters, A. S.; A. A. Gunsey, C.; E. Fiske, T.; J. D. Hoffman, Sec.; J. Thompson, G. K.; Mrs. J. D. Hoffman, Ceres; Nellie Norton, P.; Mrs. W. B. White, F.; Alice Adams, L. A. S.

* NOTE.—The Secretaries of Granges are requested to forward reports of all election and other matters of interest relating to their Grange and the Order.

MERCED GRANGE received nine candidates into full membership Nov. 16th, and afterward enjoyed a sumptuous feast, wherein the poultry and fruits of Merced county figured extensively. This Grange will hereafter hold its regular meetings on the first and third Wednesdays of each month.

STOCKTON GRANGE celebrates the anniversary of the Order on Dec. 3d, by a literary entertainment, and invites the assistance and co-operation of all the Granges in the county.

National Grange.

The full list of officers of the National Grange, elected at Lansing, Nov. 23d, is as follows:

Master—Put. Darden, Fayette, Miss.
Overseer—James Draper, Worcester, Mass.
Lecturer—Mortimer Whitehead, Middlebush, N. J.

Steward—X. X. Charters, Virginia.
Assistant Steward—J. H. Hale, Connecticut.
Chaplain—A. J. Rose, Salado, Texas.
Treasurer—F. M. McDowell, Wayne, N. Y.
Secretary—John Trimble, Washington, D. C.
Gatekeeper—A. N. Brown, Delaware.
Ceres—Mrs. Kate A. Darden, Fayette, Miss.
Pomona—Mrs. Jas. Draper, Worcester, Mass.
Flora—Mrs. M. E. Luce, Michigan.
Lady Assistant Steward—Mrs. H. A. Sims, Kansas.

Executive Committee—Dr. J. M. Blanton, Virginia, chairman; Hon. J. J. Woodman, Michigan; Hon. J. H. Brigham, Ohio, and Put. Darden, Mississippi, ex officio.

Topeka, Kansas, was selected as the next place of meeting.

On the closing day resolutions were passed favoring the election of postmasters by a direct vote of the people interested; indorsing the actions and objects of the International Peace Association, and laying out work for the Executive Committee in petitioning Congress during the next session for legislation on matters of importance to the Grange interest, such as a reduction of postal rates, appropriations for an agricultural bureau and a Washington home office, and kindred subjects.

We shall endeavor to present in our next issue a summary of the more important features of the session not mentioned in the RURAL of Nov. 26th.

Good Advice from a State Grange Committee.

At the last session of the State Grange the Committee on Good of the Order, in reporting, made the following suggestions:

We have carefully considered all questions confided to us, and have reported to the best of our ability as promptly as circumstances would permit, and now we respectfully offer a few suggestions that seem to us likely to promote the prosperity of the Order.

The prompt payment of quarterly dues by Subordinate Granges and prompt reports to the State Grange from Subordinate Granges is of vital importance. To deprive the Order of the necessary funds to enable its officers to transact the business entrusted to them renders the proper discharge of official duties difficult—in some cases impossible. The Subordinate Grange is the source of power, and from it must flow the life-giving strength to animate and sustain State and National Granges in the duties assigned them, or your State and National influence will be impotent.

Co-operation is a fundamental principle in our Order, and how to solve that immense problem and secure its potent power in favor of humanity is worthy of our best efforts. The few through co-operative effort aggregate wealth and dominate the many. There is opportunity in the Grange to study and apply co-operative methods adapted to the conditions of all its members. The accumulation of desirable books in Grange libraries for the use of members, securing periodicals and magazines at club rates, exchanging flowering shrubs and seeds in the Grange. By accumulating orders in the Grange, wholesale rates in the purchase of articles needed for domestic use may be obtained, and in case of sickness or misfortune small amounts, such as each member can afford, when accumulated may be made to yield relief of incalculable value to a suffering sister or brother. However poor a member may be in material possessions, we may all be rich in fraternal affection, and there is no way that wealth of affection can be accumulated so surely as by acts of kindness.

Experience has shown that the pure air of the country away from town influence is most congenial to Grange life.

Open meetings in which children are entertained and instructed, and where young people are brought within the moral influence of the Grange, are earnestly recommended by your committee.

Bro. I. C. Steele, Bro. John Adams, Bro. Nelson Carr, Sister N. A. Sanders, Sister M. A. Sheldon, Sister C. E. Kinney, Committee.

San Jose Grange.

At the meeting of the San Jose Grange last Saturday, Bro. Keesling reports to the Patron, the discussion on "Worms in Potatoes" was opened by Bro. D. H. Coates, who exhibited a number of Early Rose potatoes that he termed the grandchildren of those planted in February last and which were the result of potatoes left in the ground when digging his crop in June. They were of fair size and smooth appearance, but were somewhat infected with worms, although not so badly as the first crop. He stated that the presence of the worms was indicated by a dust-like substance in the eyes of the potatoes. He was of the opinion that a moth similar to the codlin moth laid its eggs on the potatoes while in the ground, and that the larvae entered the potatoes at the eyes. Bro. Pettit stated that in his experience potatoes should be dug as soon as matured, as the worms increased rapidly thereafter. Bro. Woodhams stated that this could be avoided somewhat by plowing a furrow of earth over the rows just before maturity, as it evidently prevented the moth from reaching the tubers. Sister Woodhams asked if some kind of manure or fertilizer could not be used to prevent the worms from attacking the potatoes. This Saturday the Grange will open at 10 o'clock A. M. for election of officers, after which a feast and entertainment will be provided for the members and their families.

A COTTON-PICKING BEE.—Some one writes from Pleasant Grove to the Record-Union that

on Saturday, Nov. 5th, the neighbors were invited to attend a picnic at the home and farm of Jeremiah Parker, on the Auburn ravine, when 101 on the arrival of the women and children, it turned out to be an old-fashioned cotton-picking. When all the cotton had been picked, the party repaired to the house, where a bountiful dinner was prepared, with all the good things of the season. Some of the cotton was sent by the Patrons of South Sutter Grange to Lansing, Mich., to be exhibited as a product of Sutter county.

Worthy Master Overhiser's Report.

The Worthy Master of the California State Grange made the following report to the National Grange on Tuesday, Nov. 17th:

In submitting my report it is my purpose to state as correctly as possible the condition of our Order in California.

There are in our State 54 Subordinate Granges, with a membership of about 3000, all having paid their dues to the State Grange to July 1, 1887. Forty-six have paid to October 1, 1887, leaving eight Granges in arrears for the last quarter, ending October 1st.

We have, also, in California, three Pomona Granges, in Sonoma, Sacramento and San Joaquin counties, all doing good work, and, as I have recently been informed, there are now in Sutter county a sufficient number of members ready to form another, only waiting to be organized.

Some five years since Sonoma County Grange No. 1 made an exhibit of the agricultural products of that county at the State Fair and was awarded a special premium.

At the session of the State Grange, held soon after, the following resolution was adopted:

Resolved, That the State Grange of California, through a committee to be appointed, request the State Board of Agriculture, to appropriate at least \$5000 for the purpose of encouraging agricultural exhibits at the next State Fair, and that gambling be prohibited on the Fair grounds.

This resolution was presented in due time, and the Board of Directors of the State Agricultural Society appropriated \$500 for premiums, to be awarded for county exhibits; \$250 for the first prize, \$150 for the second, \$100 for the third. The exhibits to be made by the Granges of the different counties, and the money turned over to them.

Sonoma, Sacramento, San Joaquin and several other counties entered for the prizes, which added a new and interesting feature to the fair.

In 1886 and 1887 the Agricultural Society appropriated \$2000 each year for county exhibits to be awarded as follows: \$500 for the first prize, \$300 for the second, \$200 for the third, and \$100 for the fourth.

This brought out 11 competitors at our fair this year.

The Mechanics' Institute in San Francisco, holding their exhibition at about the same time as the State Fair, also offered premiums to the counties of the State, as follows: \$1000 for the best, \$750 for the second, \$500 for the third, and \$250 for the fourth. There were six counties which placed exhibits in the Mechanics' Fair, making in all 17 counties in our State competing for supremacy.

Sonoma, Sacramento and San Joaquin counties were represented through their Pomona Granges this year.

But this competition of the counties of our State was only a small part of the good accomplished by the resolution passed at the State Grange session of 1884. These county exhibits created a new and healthier interest in our agricultural fairs, and were the means of calling the attention of our people, both young and old, to the true object of agricultural fairs, the study of all the products of the farm, and away in a measure, from racing and gambling.

We hope that in the near future gambling and the use of intoxicating liquors will be banished from our fair grounds, and if so desirable a result is obtained we will have every reason to believe that it has been brought about through the moral influence of our Order. During the past year four new Granges have been added to the list and three dormant ones revived.

Believing that more means were required to carry on the revival work commenced last year, at the last State Grange meeting the dues were increased, so that we might be better able to keep the State Lecturer and deputies in the field.

The lectures and suggestions of Bro. Whitehead, National Lecturer, as published in our Grange organ, the CALIFORNIA PATRON, have been the means of great good in our State, but could he in addition "come over and help us," and let us who are beyond the Sierras hear his voice in our halls, I believe the number of Granges in California might be doubled during the next year.

In conclusion, I desire to call your attention to some of the products of California, its golden sheaves and ripened fruits. These were sent by the people of our State, that you may see what our varied climate and fertile soil will produce.

Worthy Master and members of the National Grange, I will now extend to you a renewed invitation to hold your next annual session in California.

POMONA'S PORTRAIT.—Among the contributions to the National Grange exhibit at Lansing, the Secretary of the State Grange mailed

an enlarged photograph (20 by 24 inches) of Sister Roache as she appeared at Santa Rosa in her regalia of fruit, staff and other decorations. This fine likeness will, it is probable, be fittingly placed in the office of the National Secretary at Washington. A similar copy can be seen at the office of the State Secretary.

It is very gratifying to notice that so many Granges in California and Oregon are now arranging for celebrating the birthday of the Order. They will all have a good time and Grange-inspiring results.

SECRETARY TRIMBLE of the National Grange reports 28 new Granges organized during the month of October, against eight for the same month last year.

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

CITRUS FAIR.—*Oroville Register*, Nov. 24: Everything is progressing favorably for the Oroville Citrus Fair; the courthouse yard is being put in fine condition, the lumber has been hauled to the ground for the framework for the building, the contract is let to cover this with canvas, and the committees are all at work in their respective departments. Many fruit-growers have spoken for room for exhibit, and everything indicates that the fair will be a grand success.

BIG BEETS.—*Gridley Herald*, Nov. 24: In 1883 Garret Keppel planted about six acres of his adobe and slickens land to sugar beets, intending to use the same for hog and cattle feed. The seed was sown the early part of December. In June, 1884, some of the beets were so large that it required a two-horse team to pull them out of the ground; and one was thus pulled up which weighed 187 pounds. The soil is still there and its area embraces nearly 2500 acres. It lies along the Cherokee slickens canal, where moisture is abundant the year round. We do not believe better land for the purpose can be found on the coast.

Colusa.

IRRIGATION TRIUMPHANT.—*Colusa Sun*, Nov. 26: The votes by precincts on the Irrigation question in Central Districts was as follows: Division No. 1; Yes, 11; No, 13. No. 2: Yes, 16; No, 6. No. 3: Yes, 31; No, 4. No. 4: Yes, 97; No, 10. No. 5: Yes, 116; No, 18. Total: Yes, 271; No, 51. The vote on all the officers except Treasurer and Director in Division No. 4 was practically unanimous—the votes except for those elected being scattering. The officers of Central Irrigation district are: Assessor, J. B. Compton; collector, W. F. Mason; treasurer, Chas. B. Harden. Directors: 1st Division, F. X. St. Louis; 2d, H. B. St. Louis; 3d, Jos. A. Sutton; 4th, R. DeLappe; 5th, A. J. Tully. All of them are strongly for irrigation except F. X. St. Louis, and he, of course, will simply try to have the work done right.

Contra Costa.

A VETERAN ORANGE TREE.—*Antioch Ledger*: J. P. Walton, the venerable horticulturist and pioneer-orchardist, informs us that the seedling orange tree planted by him 18 years ago is vigorous and healthy. It has attained a height of 12 to 15 feet, and is at present full of finely developed fruit. He says he has picked over 700 oranges from the tree in former seasons, and it is now as full as it has ever been. The fruit is entirely free from mold or blemish, and both tree and fruit present an appearance that fulfills one's ideal of this most beautiful of fruits. Mr. Walton has other orange trees of more recent growth, all in bearing, and showing abundant fruitage. These trees have never been attacked with scale to any extent; one application of whale-oil soap has been found a sufficiently destructive agent to clean them off at any time.

Fresno.

SWEET POTATOES.—*Expositor*: Moodey & Bretzner have a 23-pound sweet potato on exhibition. The hill from which it was taken contained 132 pounds of potatoes. They grew on the place of James McKay, Fresno Colony.

Marin.

SCARCITY OF FEED.—*San Rafael Journal*, Nov. 24: Feed is very short in most parts of this county, in fact it is nil. Quite a number of cattle have already died. The safe thing is to raise hay enough to keep all the stock on the place, and then don't be tempted to sell it, no matter what price may be offered. The higher the price of hay the surer you are to need it.

Mendocino.

WHAT POISONED THEM?—*Mendocino Beacon*, Nov. 26: At Little River last Tuesday, two cows belonging to Mrs. R. Stevens were turned out of the stable about 10 o'clock in the morning, and wandered down to a watering-trough. On returning to the farmyard, they showed signs of distress, and in less than two hours both died. It was evident that they had partaken of poison of some kind, as they were taken with frequent spasms and suffered much pain. Upon cutting them open, the blood was found to be clotted considerably, but the flesh, instead of being blue, as in most cases of poisoning, was red, as if poisoned by strychnine. Near the watering-place where they drank grows some hellebore, or Indian poke, and there was some evidence that it had been cropped off. It is commonly supposed that

animals will not eat it, and it is frequently found on the ranches in this part of the country. We would be pleased to hear from any of our readers if they have ever known cattle to eat it, and if so if it has been followed with fatal results.

Merced.

TIMBER CULTURE WITH ARTESIAN WATER.—*Merced Argus*: W. G. Mills some time ago filed a timber culture claim on a quarter-section of land, about 10 miles southwest of town, and at once set to work improving it in accordance with the provisions of the land laws of the United States, and in order to facilitate the growth of timber, he has gone to work boring for artesian water, and at the depth of 250 feet has struck an average flow of water, but will continue boring 50 or 100 feet further, though the flow at present is ample to irrigate the breadth of land required to be cultivated in trees in compliance with the terms of the "Timber Culture" law.

MERCED FRUITS.—*Argus*, Nov. 17: We observed at the Grangers' banquet yesterday a variety of fruits, the product of Merced county, among which were almonds of three kinds—paper-shell, soft-shell, and the small hard-shell—English walnuts, both hard-shell and paper-shells, several varieties of grapes—wine, table, and raisin; late fall and winter apples of several varieties, perfect in flavor, color and shape, and free from blemish. Most of these were raised on Merced river-bottom lands, John A. Robinson's orchard being credited with fruits of the foregoing varieties that would compare favorably with similar products raised in any locality. Besides, Mr. Robinson had on exhibition a limb loaded with ripe and luscious Japanese persimmons.

Monterey.

JOLON JOTTINGS.—*Cor. Salinas Index*, Nov. 21: It is almost Thanksgiving Day, and no rain yet. Our farmers are clearing brush and getting ready for plowing. Cattle are beginning to die off here. Some of the ranches are overstocked, and there is no feed. There is plenty of mast, but it doesn't seem to do much good. Where there is water the poor cattle get into the mud and there they die. It seems too bad that such big ranches do not raise hay to keep their stock from starving.... This will undoubtedly be a good fruit country. When thoroughly plowed and cultivated, the soil keeps moist all summer. J. A. Forbes was offered \$3000 for 80 acres by parties who wanted it for grapes and olives. The brush land, which was thought to be good for nothing a few years ago, is now considered as good as any other. It improves with working. Mr. Ulrey of Pine Canyon cleared a piece of brush land 10 years ago, and says it has improved every year since.

Placer.

FIRST SHIPMENT OF ORANGES.—*Record-Union*, Nov. 25: Curtis Bros. & Co. of this city received yesterday 10 crates of oranges from Newcastle. They were of the St. Michael variety, and were grown and shipped by A. Moger. The oranges were of good size and excellent flavor, and will command very high prices.

San Benito.

ORANGES.—*Hollister Free Lance*, Nov. 25: Last April Dr. J. D. Hendricks set out a pair of young orange trees, one year old, of the Washington Navel variety. He gave them every attention, and was surprised by one of the trees blossoming, and forming a dozen oranges. The tree being so young, the oranges were picked off. The trees are looking remarkably well.

PLOWING BY STEAM.—On Wednesday a traction engine was set in motion for the first time in this valley. The engine was brought hither by Thos. Flint, who believes it can be successfully employed in plowing the fertile fields of San Benito county. The engine does the work of 35 horses, and easily pulls along four heavy gang-plows, set deep in the ground, at a speed of three miles an hour. The engine can be guided at will by means of a small wheel, and its movements can be directed by a boy. It will turn round in very narrow quarters, and can be backed or moved in any direction at will. It is kept from sinking into the soft ground by wheels 16 inches wide, the width of which also gives the necessary friction, which prevents the wheels from slipping.

Santa Barbara.

OLIVES IN THE SANTA INEZ.—*Ballard Cor. Press*: There are no less than 25,000 olive trees already planted in the valley, all within a radius of two miles, and covering an area of some 400 acres. At one spot in the valley it is possible to see 13,000 trees in one vast stretch, each long line straight as it is possible for human agency to make it. The soil is kept in a beautiful state of cultivation, entirely free from weeds, and in such a loose condition as to retain a large amount of moisture even in the driest season. Our soil is a loose, gravelly loam, and when taken at the right time is easy to keep free from weeds. The oldest orchard, that of R. R. Selby, has now been planted nearly five years, the trees being mostly three years old from the nursery, thus making them nearly eight years old at present; these bore slightly for the first time this year, and are in fine growing condition.

Santa Clara.

CITRUS SUCCESSES.—*Santa Clara Journal*, Nov. 25: Any one doubting that oranges and lemons will grow to perfection in this valley, can have those doubts removed if he will make a visit to the farm of Mr. H. Curtner at

Warm Springs, and take a look at some bearing trees on his place. The boughs are loaded to their utmost capacity with fruit of as fine quality as was ever raised in the southern part of the State. Mr. Curtner also has several lemon trees which are likewise bearing heavily, and show as large lemons as we have ever seen, and of very fine flavor. The vicinity of Warm Springs appears to be one of the favored localities.

SECOND CROP GRAPES.—Mr. A. V. Fatjo made a trip west of town this week, and while driving past the place of Mr. Norton, noticed that gentleman gathering a very heavy crop of grapes, the second growth of this year. The grapes were yielding about four tons to the acre. Mr. Norton informed him that the first crop had yielded quite as largely as the last one was doing. The cause of this large yield was pruning the vines very short the winter before.

Santa Cruz.

DRIER AT SOQUEL.—*Courier-Item*, Nov. 26: Mr. R. H. Martin purchased and erected an evaporator, getting it in working order a little over a month ago, too late to avail himself of any fruit except apples. But he has kept it running nearly to its full capacity, evaporating 60 boxes of apples per day. He received an order last week for a ton and a half of the dried fruit, and will not be able to fill orders, so that there is neither doubt nor difficulty about a market for his product, which is of an excellent quality. The vinegar made from the skins and cores of the apples also commands ready sale. Eight girls are employed to pare, core and slice the apples, two young men in the packing, etc., and one overseer, Mr. Shaw, who attends to the evaporation. The evaporator will probably run about two months more upon apples, and Mr. Martin will then put up a considerably larger one to be ready for next season's work.

Solano.

EDITORS PRESS.—Not much doing now. Many are pruning vines and trees. Those pruning trees are generally only side-pruning, and will not finish the top until the leaves drop, when they can see better how to shape the tree. We had a frost last Thursday night, which killed the tomato vines and leaves on the grape-vines in many places. The last two nights we had ice half an inch thick, and the pumps were frozen up solid. The mercury stood at 32° this morning—pretty cold for a semi-tropical climate. Oranges are ripe in Pleasant valley, and are now being shipped. It is one of the many blessings we now enjoy that we have not many orange trees, for if we had, fruit-picking would never end in Vaca and Pleasant valleys.—*G., Vacaville*, Nov. 27th.

Sutter.

JAPANESE PERSIMMONS.—T. B. Hull of Sutter county brought to the *Appeal* office the other day some very handsome specimens of Japanese persimmons. They were of the flattened-globe shape, and two had one end pointed. The latter were from a tree of the U. S. Government importation and free distribution made in 1879-80. The Japanese persimmon thrives well in this section, and the trees with their rich-colored fruit are beautiful ornaments.

INDIAN CORN.—*Sutter Farmer*, Nov. 25: Jacob Doty of Meridian has favored us with a sample of the corn crop, grown on his farm on the Sacramento river, in this county. The ears average 10 to 12 inches in length, and are well filled with large, plump kernels and as handsome as we ever saw in the Eastern States. A portion of the sample will be left at the office of the Bureau of Immigration for Yuba and Sutter counties, in Marysville, and the rest will be sent to the rooms of the State Board of Trade, San Francisco.

Tulare.

CURTAILED PASTURES.—*Della*, Nov. 24: All the cattle and sheep taken to the mountains during the summer were brought back to the valley or foothills some time ago in excellent condition. Some of them are pastured on the large stubble-fields, but those that depend upon the natural feed find scant pasturage. In another year there will be little land in the valley portion of this county not cultivated, and the pasture-lands will be greatly restricted in consequence. Owners of sheep will feel the change most. The day of the sheepman in the valley is nearly over.

Ventura.

EDITORS PRESS.—There are many improvements going on and others contemplated in our young "city by the sea," such as building, laying sidewalks, and everything pertaining to the beautifying of a place already notable for its many advantages. Despite drawbacks in the early part of the season, farmers have done well, crops of corn and beans having yielded much better than expected before harvest, as our well-filled warehouses attest. There was a rainfall of one to two inches last night, and from present appearances we will have more before the weather clears up, which will start vegetation, and soon our hills will be clothed in green. Then the weary traveler can find no more beautiful spot for a sojourn of a few days than in the Santa Clara valley.—*D., Ventura*, Nov. 23d.

Yolo.

THE RAISIN INTEREST.—On the 22d inst. a representative of the *Mail* asked Mr. N. Wyckoff, the well known raisin-maker, how Yolo county's raisin-crop has turned out this year, and he answered: "I think I may safely say, very well indeed. The market for 'Layers' is active and good, ranging from \$1.60 to

\$1.90 per box in Sacramento. There seems to be an over-abundance of loose raisins on the market, and the demand is not so good for that class of goods. I attribute this to two causes. Last year loose raisins commanded so good a price that those who had packed their raisins in layers hardly felt compensated for the extra trouble. Then again, this year bunches did not fill out so well as usual, were more straggling, so that it was easier to strip them loose than pack in layers. The second crop this year is remarkably good, and the season could hardly have been any better for curing. Yes, I think Yolo raisin-growers have done very well this season, and the prospects are excellent. I have sampled the foreign raisin and candidly I must say that I consider the California raisin its superior. The Yolo county raisin possesses merits that the world cannot beat."... The raisin-men, generally speaking, are intelligent and progressive, and they are exercising all that care and caution in curing and packing which will enable them to establish an enduring commercial reputation for the California raisin.

ARIZONA.

ALFALFA.—*Florence Enterprise*, Nov. 19: C. W. Fuller has finished cutting his fifth crop of alfalfa for the present year, the last cutting giving a yield of about a ton of hay to the acre. He has on his ranch 4½ miles east of town 15 acres of alfalfa and has cut over 150 tons of hay from the field, an average of 10 tons to the acre, all of which brought \$12.50 per ton in Florence. The first crop last spring yielded 4½ tons to the acre, the alfalfa being about 9 feet in height. The subsequent crops were not permitted to grow so rank, but they exceeded a ton to the acre on an average. The proceeds of the total crop of hay from Mr. Fuller's 15-acre field amounted to \$1875, or \$125 per acre, and he has the benefit of fine pasturage all winter.

OREGON.

MORE SAMPLES.—*Rogue River Courier*, Nov. 25: On Monday Mr. Shattuck brought into town a load of vegetables that would have done credit to any place in the world. A number of his potatoes of the "King" variety weighed from two to five pounds. His carrots, a garden variety, were the size of large beets; while the beets weighed in the vicinity of 30 pounds each. These mammoth vegetables were produced without irrigation, and are an evidence of what intelligent cultivation of our soil will accomplish.... H. L. Robertson, living 12 miles down Rogue river, brought in some very fine vegetables on Tuesday. One of his blood beets was three feet ten inches long, and a sugar beet weighed 35 pounds. We have to thank Mr. Robertson for a box of delicious Rambo apples, which variety seems to do particularly well in this section.... J. McDaniels of Applegate brought us one day last week one of the finest collections of apples we have seen on the Western coast. They consisted of Swaar, Spitzenburg and Smith Cider. The Spitzenburgs were particularly large and handsome. Such fruit, properly put up, would bring 15 or 20 cents per pound in many southern markets, or in those of inland States.

CATTLE MAY STOP AT RENO.—We recently stated the issue the Nevada cattlemen made with the railway, that they be permitted to unload stock at Reno for a season of feeding, without being obliged to re-ship at new rates. If the railway refused to make this concession the growers proposed to make a drive to Reno and ship from that point, thus saving the railroad freight from their several locations to Reno. The railroad does not like this idea and General Manager A. N. Towne, after considering the matter, agreed to incorporate the following provision into the cattle-shippers' contract, which was found acceptable:

Cattle shipped from points in Nevada, east of Reno, to San Francisco or other destinations in California, may, during the period from October 15th of each year to April 15th of the next year, at the request of the shipper, be stopped in transit at Reno, in the State of Nevada, provided that the through rate from the point of shipment to the point of final destination be prepaid or paid at Reno upon such stoppage, it being understood and agreed that such stoppage shall be for the purpose only of feeding and taking care of such cattle, and that the shippers thereof shall and will ship the same cattle and no other from Reno to their destination not later than the 15th of April next ensuing; and that upon such reshipment, the shipper shall pay to the Southern Pacific Co. the further sum of \$5 for each and every carload of such cattle so reshipped to defray the additional expense thereby caused.

THE OREGON STATE AGRICULTURAL SOCIETY has decided that the next State Fair be held near Salem, after the middle of September. A portion of the new officers are as follows: Pres., J. T. Apperson; V.-P., M. Wilkins; Sec., J. T. Gregg; Treas., A. Bush; Ex. Com., Van Delashmutt, J. Q. Wilson, Wm. Galloway, D. H. Looney; Supt. of pavilion, K. L. Hibbard.

OUR PAPER THIS WEEK.—The freight blockade existing on the overland railroads caused no little inconvenience upon this coast. Among its effects is a paper-famine, to which our readers will charitably ascribe the inferior quality of the sheets on which this week's paper is printed. We have our usual shipment on the way.

Smile When'er You Can.

When things don't go to suit you,
And the world seems upside down,
Don't waste your time in fretting,
But drive away that frown;
Since life is oft perplexing,
It is the wisest plan
To bear all trials bravely,
And smile when'er you can.

Why should you dread to-morrow
And thus spoil your to-day?
For when you borrow trouble,
You always have to pay.
It is a good old maxim
Which often should be preached—
Don't cross the bridge before you
Until the bridge is reached.

You might be spared much sighing
If you would keep in mind
The thought that good and evil
Are always here combined;
There must be something wanting,
And though you roll in wealth,
You may miss from your casket
That precious jewel health.

Though you are strong and sturdy,
Not full may be your purse,
And earth has many trials
Which I consider worse;
But whether joy or sorrow
Fill your mortal span,
'Twill make your pathway brighter
To smile when'er you can.

Will She Marry?

There were only seven of us, all girls, in the dear old parsonage at Wrayburn, where papa had lived for 30 years. Under the daisies in the pretty country churchyard dear mamma had slept since Kate was a wee baby, and Aunt Jane had come to care for the motherless children of her brother as soon as the calamity fell upon him.

We are a rosy-cheeked, healthy set of girls, rather good-looking, Nell being our beauty, and I the only invalid. I am a cripple; but I am not going to bother you with my story, excepting as my observations are recorded.

It was in the spring, and my sisters and Aunt Jane were very busy with housework. I was in my room knitting; papa was wandering about, disconsolate at the invasion of his study and consequent interruption of his literary work, when the murmur of voices from the porch floated up to me, and I mentally exclaimed:

"Dear me! Chris is proposing to Nell again!"
"And nobody ever will or ever can love you as I do," Chris was saying.

Then Nell's voice struck in:
"There, that window fairly dazzles you! Who says I can't clean glass? Oh! I beg your pardon, Chris. No, of course!"
"But, Nell, do listen to me."

"Chris, did you ask me to marry you when I was in my cradle? I am sure you have asked me once a week ever since. I won't, you know, or ought to know by this time. Why can't you ask somebody else, just for variety? I am sure any of the other girls will make a much better wife than I will; that is," said Nell, with a sudden spasm of loyalty for the rest of us, "if any of them would take you."

"How can I care for any one else when my whole heart has been yours all my life?" said Chris, disconsolately. "It is cruel to trifle so with true and honest love."

"Don't be an idiot!" said Nell, sharply. "I told you that you were a horrid boy, and I would never marry you, when you used to steal apples to present to me, and I never, never told you anything else, did I?"

"No," sighed Chris.

"Then why don't you let me alone?"
Here Aunt Jane, her head tied up in a manner that defies description, came upon the scene, saying:

"Oh, here's Chris! Chris, do run over to Smith's and get me a paper of carpet tacks!"
Chris departed.

Presently Smith's boy brought the carpet-tacks, and Nell was left alone for the remainder of that day, as far as Chris was concerned. The next day the cleaning went forward briskly, but it was still early in the morning when Nell came to my room equipped for a walk.

"Any letters?" she asked, carelessly. "I am going down the street."

"None," I said. "I did not think you could be spared."

"Aunt Jane is rather grumpy about it," said Nell, adjusting a coquettish wreath of apple blossoms upon her hat; "but I want to get the smell of soap-suds out of my nose. 'I may stop at Gilmore's. Have you any message?'"

"Only my love to Mrs. Gilmore."
Now Mrs. Gilmore was the mother of Nell's persistent adorer, Christopher Nelson Gilmore, and the families had been intimate for years.

Still, for Nell to take middle of house-cleaning week to call on Mrs. Gilmore was a little out of order.

She flitted away, her sunny curls dancing in the soft May breeze, and I, putting two and two together, remembered that Chris had not been in the house for 24 hours. Vainly I tried to recall a similar interval when he was in Wrayburn. School, college, business had called him out of the village, but his home hours were always fairly divided between his mother's house and ours.

Something must be the matter! I thought of all possible and impossible catastrophes, till I was not surprised to see Nell coming in at the gate in a subdued frame of mind apparent upon her pretty face. She came directly to me, as they all do, even Aunt Jane and papa, in emergencies.

"Belle," she said, in a low, grave tone, "Chris has gone to Cape Town."
"Gone?" I cried; "why, he was here yesterday!"

"He went to London yesterday afternoon, and he has gone to visit his uncle, the one who offered him a business opening some time ago. Chris did not want a business opening, as he has plenty of money, and Belle, Mrs. Gilmore says that it is all my fault that she is left alone and childless."

"Scarcely your fault, dear," I said, my heart aching for the piteous strain in the sweet voice, the pain in the bright eyes. "You were right to refuse to marry a man you do not love, and I am sure Chris will find a wife and return."

But Nell only grew whiter, and went slowly to her own room. After that, in all the family lamentations for Chris, so many years a sort of adopted brother in our midst, Nell never spoke of him.

The next winter, Meg, our eldest, was married; and, as if matrimony was a contagion, Jane followed her example; then Maud, Lizzie, and even Kate, our baby. Nell, the prettiest, smartest, sweetest of all, had offers in abundance, spent two winters in London visiting Meg, and, by all accounts, captivating hearts by the score, but coming back to be the life and brightness of our home.

"There must be one old maid in every family," she said; and when I suggested my eminent fitness for the position, she smiled loftily and said: "Mr. Brooks says you are the household angel, so please let us hear no more nonsense."

"There is Aunt Jane, too," I said mildly.
"Belle," she said, severely, "will you stop talking nonsense? Aunt Jane, indeed!"

It really did seem as if Nell was in earnest about a single life; but, after all, she was only 24 and looked 17.

But one day who should walk into the parsonage parlor, as coolly as if he had left it the day before, but Chris. We were all there as he came in, but before he had spoken to Aunt Jane I saw that Nell had vanished.

Did Chris see her run out of the door as he entered the front window? I think he did. There was a subdued twinkle in his eyes as he inquired for my infirmities, not at all consistent with his words of sympathy. Presently Nell came in, with a quiet smile of greeting and a perfect composure of manner; but Chris was a match for her.

It was as good as a play to watch those two, so completely did they ignore that he was a discarded lover who had been sent away by her cruelty. They conversed easily and gracefully—Christopher's African experiences, varied by descriptions of the family weddings, the new homes, the brothers-in-law, the children, and a thousand other details, in which our caller expressed the greatest interest.

After that he dropped in as of old, making himself agreeable and useful to every one in the house, especially tender, as he ever had been, to me. Indeed, I found myself wondering sometimes if he was going to take Nell's mocking advice, and all the others being appropriated, offer himself to the poor cripple.

He took me for long drives in his mother's pony carriage, and was always ready to hear of Nell's conquests, showing no jealousy, but a great deal of amusement, over her coquetries.

"She was a born coquette!" he said once; "and yet nobody can call Nell vain. It has been a matter of course for her to be admired ever since she could run alone."

"She is our beauty now, as of old," I answered; and Chris assented cordially.

"I have seen no face so winsome since I left home," he said; but he spoke with the frank admiration of a brother, and gave no token of a lovesick swain.

Had he outlived his love, I wondered, and come home to prove to Nell that her days of tyranny were over? I think Nell suspected that he had.

Always even-tempered, Nell became fitful and capricious; bright and laughing when Chris was with us, often silent, and sometimes gloomy when she thought herself unnoticed. She lost her color, and I caught her more than once rubbing her cheeks when going downstairs to see Chris, and she was snappish and deeply repentant therefore a dozen times a day.

"What ails Nell?" Aunt Jane asked me, anxious for her darling. "She eats nothing, Belle, and I am sure does not sleep well. I wonder if it would do her any good to spend a few days with our Kate?"

Nell, on being consulted, caught eagerly at the suggestion, and hurried her wardrobe into a trunk as if answering a sudden life or death summons. She made no farewells, but fitted

off so abruptly that it made us all stare with surprise.

"Elinor was always impulsive," papa said. And Aunt Jane only answered:

"But bless me! I didn't mean to drive the child out of the house."

Chris said nothing, but I was certainly convinced of the reality of his whiskers, so ferociously were they pulled all the evening. But the next day Mrs. Gilmore sent over a wee note of dire distress: Chris had been thrown from his horse, and the doctors feared some spinal injury. Aunt Jane went over at once, and came back with an exceedingly grave face.

"He is badly hurt—entirely unconscious," she said.

If Nell's departure was sudden, her return was not less so.

"Did you take off your hat at Kate's?" I inquired, with mild sarcasm.

But I regretted it when Nell's arm stole around my neck, and a face wet with tears was pressed against my own.

"Will he die?" she whispered. "O Belle! what shall I do if he dies?"

Then, as if ashamed of letting even my loving eyes read her secret, she rushed away and locked herself in her room. Such restless misery followed that my heart ached for her. She made Aunt Jane spend nearly all her time at Mrs. Gilmore's, and undertook the housekeeping herself, letting papa miss nothing of his sister's care. But she seemed to live in a sort of breathless expectation of the news from Chris.

Worse! worse! very low! Such were the disheartening tidings day after day, until there came one dreadful night of agonized watching, and Chris changed for the better.

Convalescence was slow and tedious; but one day, when we were all in the drawing-room, there was a soft rush across the room, on the porch, down the garden, and a joyous ring in Nell's voice, crying:

"O Chris! Dear Chris! are you really here once more?"

Then I saw him leaning one hand on her shoulder, one on his cane, as he came feebly up the path, pale, thin and weak, but Chris restored to us after all our anxiety.

Spring came round once more, and Nell and Aunt Jane busied themselves with the usual extra housework. Once more voices floated up to me from the porch.

"You were cleaning those windows when I went away, Nell."

"Please, Chris, don't!" Nell pleaded.

"Don't repeat the offense for which I was banished, Nell? But I must, darling; it is for the last time."

"Hush!" I whispered at this crisis, as Aunt Jane entered my room. "Chris is proposing to Nell."

"Well," said my aunt, "that is an old story."

"But she has accepted him," I said, exultantly, as faintly stole up to me:

"Yes, dear Chris; I know now you are the only man I could ever love."

"Ahem!" said Aunt Jane. "You and I, Belle, will be the old maids of the family, after all."—*Exchange.*

Temperance Text-Books.

During the last five years, the Legislatures of 23 out of our 35 States, and the National Congress for all the ten Territories, have made the study of Scientific Temperance compulsory "for all pupils in all their public schools."

The population of these States and Territories is over one-half that of the whole country. Thus America's majority to-morrow is in these schools of to-day.

It was the intention of those who secured these laws that the children should have the latest science concerning the dangers and hurtful qualities of alcohol used in any degree, and the peril of forming the habit of its use.

The law requires this; nothing less than this will ever satisfy its friends.

Those text-books that only point out the evils of drunkenness and the danger of excessive use of alcoholic drinks and narcotics, do not meet the requirements of the law, and do not satisfy those who secured its enactment, and who are determined to secure its enforcement.

A petition, therefore, has been signed by many legislators who voted for these laws in various States, and in the National Congress, by the representatives of Temperance organizations, who are familiar with the sentiments, and are entitled to speak for the very numerous membership of different churches and other bodies, extending widely throughout the land, and by citizens who speak for themselves.

This petition makes a respectful and earnest appeal to all publishers of text-books on this subject, to revise their publications to conform to the latest results of scientific inquiry, and to meet the terms and spirit of these statutes, so that public and authorized expressions of approval and indorsement of all such books can be issued and given wide circulation.

Such an appeal to all publishers effectually refutes the charge that the friends of Temperance instruction are peculiarly interested in the sale of any particular book. It is because the question of total abstinence for the children of this country, and, therefore, of their well-being, and that of the land soon to be governed by them, depends largely upon the teachings in the text-books employed, that this appeal is made.

Woman's Especial Vocation.

T. W. Higginson is fortunately ready to advocate all sides on the woman question, and in the last *Harper's Bazar* he takes up the defense of the vocation of wife and mother which modern "advanced thought" has been so inclined to rate below that of the successful professional woman. His line of argument is as follows:

When a successful author becomes a teacher, or an eminent lawyer takes to politics, there is no general complaint or criticism. Everybody recognizes that there are many different spheres of usefulness, and that though a change of occupation offers a risk of failure, it also presents an opportunity of increased success. But when one of the most eminent of American women resigns in her early prime the presidency of a great educational institution simply to become the wife of a professor in another such institution, people shake their heads as if something quite unusual or inconsistent had been done. "See," they say, "the result of putting women into these positions! Had a man been president of ——— college, he would have simply continued his official duties after marriage, and probably with increased energy and usefulness."

And yet these are the same people who tell us, in another breath, that it is the very highest function of a woman to be head of the household, and that no public duty, however important, should be allowed to stand in its way for a moment. In this view, a woman who is married is promoted, and it is recognized that however admirably she may have done her former work, her new work is higher still. But waiving this extreme claim, and supposing that a woman

Simply Changes Her Vocation.

Without rising or falling, it is plain that she merely does what men are allowed to do all the time. Nor is it necessary to assume that there is any rise or fall in the change now described. It is impossible to estimate the good to be done by a noble and lovable woman at the head of 700 young girls; but it is equally impossible to overrate the good which may be done by that same woman—first in her own household and then as the dispenser of hospitality and influence in a university town. It is absurd, in this age of the world, to deny the enormous influence that may be exerted by unmarried or childless women; but it would be still more absurd to deny the supreme dignity and vast influence of the home. And the home is the woman; without her there may be a luxurious abiding-place, but no home. Whatever her previous achievements or opportunities, no woman can be said to step downward when she passes to the head of a fireside. The habit in all social circles of giving precedence to the married woman—though sometimes absurd in application—is a recognition of this fact. In ancient Rome, where priests were married, a priest lost his office on becoming a widower. The American woman, especially if already a teacher, completes the dignity of her office in becoming a wife.

Even in regard to her former pupils, she cements her control over them by preceding where it is their normal destiny to follow. The most adoring pupil of an unmarried teacher is compelled either to take that teacher strictly for a model and remain herself unwedded, or, being married, to find herself launched at once upon a career where her model has afforded no direct and immediate example. She is like the

Loyal Subject of a Virgin Queen.

A subject who can never tell how her sovereign would have borne the responsibilities that she herself incurs. All the recent jubilee services in England and elsewhere have shown how immeasurably greater has been Victoria's influence from the simple fact that she herself has assumed and fulfilled—and on the liberal English scale—the duties she shares with the humblest married woman in her realm. The stoutest republican, to whom all else in the jubilee procession seemed medieval and childish, might well uncover his head at the spectacle of a woman escorted by a body-guard of outriders, all being her sons, or sons-in-law, or grandsons. That escort made her more than a queen or empress, for it vindicated her as a woman.

The prospective marriage of which I speak, although it may cost ——— college an incomparable president, yet vindicates all women's colleges from two serious though shallow charges—that they destroy feminine "chances" for matrimony, and that they diminish the inclination of young women for that sphere. Wedlock with a college professor, however eminent, may not, indeed, seem so glittering a "chance" as that held out to Gentle Jane in "Patience":

"The consequence was, she was given in marriage To a first-class earl as keeps his carriage."

Yet to an honest American heart it will seem a far more desirable lot in itself, and even as pertaining to that aristocracy of brains which is the nearest approach to caste that America affords—a reality before which the prestige of mere wealth is a very shallow and local phenomenon. And as a proof that the highest cultivation is also compatible with true womanhood and the recognition of woman's duties, such a

Shining Example Refutes a Million Sneers Against the alleged misanthropy of educated women. The higher education will in all prob-

ability make young girls more exacting in their demands upon young men—it would be a misfortune all round if it did not—and it may, therefore, make young men emulate Shakespeare's Brutus in praying the gods to make them worthy of these noble wives. But all education that is truly higher will make women more womanly, and will give them a truer ambition to fulfill the whole career of life.

Instead, therefore, of citing it as a proof of the unfitness of woman for a high educational position that she may leave it any day to be married, we should rather say that she in that case honors two offices in turn, one of which a man might perhaps have filled equally, while the other—that of the creator of the home—no man can fill, so that it must be hers alone. Under such circumstances her half-career of official work, followed by a career of other kindred duty, may well count for more than the whole lifetime of many a worthy masculine president who has filled that vocation only. But, after all, how subordinate a matter is this question of vocations! What really exerts influence is the man or woman. Where MacGregor sits, there is the head of the table. And, as Jean Paul finely puts it in his "Levana," a woman is first and chiefly a human being, and no special vocation can overbalance or replace that, but must become its means, not its end.

On the Wing in San Mateo.

EDITORS PRESS:—Few places, even in California, can offer more attractions as a suburban home than San Mateo, a town of about 800 inhabitants located on San Francisco bay 20 odd miles from California's metropolis. Here we spent Sunday, the 13th inst., and a more delightful day we have not experienced this year. Residents claim that Los Angeles has no percentage over them in point of climate. The place boasts of many very fine residences, most of the occupants of which are engaged in business in San Francisco. The most expensive palace and grounds are owned by A. Haywood, Esq., the cost of which is reckoned at about \$350,000. Others very nearly approach it in elegance, if not in cost. The valuation of the property of San Mateo amounts to about \$65,000,000. We came in contact with people here whom it was a pleasure to meet, and to whom we are under obligations for favors.

Having a desire to see the Spring Valley Water Works, whence San Francisco derives her supply of water, and having also in view the object of extending the patronage of your journal, we drove thither on Monday morning. The Crystal Spring dam now in course of construction is only about five miles from San Mateo up a creek of this name. We found it a pleasant drive, the road being sprinkled daily, and was accordingly almost free from dust. At the dam we found a camp of over 300 men at work, running five engines and six rock-crushers. The work was commenced last spring and already 22,000 barrels of cement have been used in the dam. It is computed that it will require the present force two years to complete the work, and the expenditure of about two millions of dollars. The dam will be 170 feet high and the capacity of the reservoir thirty billions of gallons. The source of supply upon which it is depended to fill the reservoir is San Francisco creek and from the rainfall of winter. It will be the largest reservoir in the world.

After dinner we drove over to the county almshouse, which is superintended by Mr. J. C. Potter, who has discharged his duty so satisfactorily that he has held his position for about ten years. There are at present 27 patients in the institution.

We were hospitably entertained on Monday night by Mr. and Mrs. J. T. Hoyt, who reside within a few miles of San Mateo. Mr. Hoyt prides in fine stock. His Berkshires are beauties, and his Jerseys unexcelled.

At the Holstein farm, McLellan Bros., we saw some excellent Holstein cattle. The proprietors prefer this stock to any other, claiming that they are better milkers and gentler to handle.

At the ranch of Andrew Smith, Esq., superintended by Mr. Jao. Shanks, we had the satisfaction of seeing some of the purest bred Berkshire swine in the State; also some Shropshire Downs. Mr. Smith imports direct from England.

This locality is admirably adapted for fruit-growing and much attention is being given to the business. Those visiting Redwood City will be well repaid in driving to the foothills west of town to get a glimpse of the surrounding country. From here we have a fine view of Mt. Diablo, Mt. Hamilton, the home of the Lick Observatory, and other points of interest. The hospitality of the people of this neighborhood is also an additional charm.

Redwood City, county seat of San Mateo, is a thriving town of 2000 inhabitants, and also offers many attractions as a place in which to live. A-joining this place may be seen on the neat farm of Frank Kenfield, Esq., some excellent stock of horses, cattle, and hogs.

Friday night we passed with Mr. John Winkler and lady at Woodside. Mr. Winkler has a fine vineyard and has commenced winemaking, having 15,000 gallons now ready for market. This locality, which is six miles south of Redwood, claims some advantages over the country nearer the bay, as it is rarely visited with fog.

That Faithful Wife of Idaho.

BY JOAQUIN MILLER.

Huge silver snow-peaks white as wool;
Huge sleek, fat steers knee-deep in grass,
And belly deep, and belly full,
Their flower-beds one fragrant mass.
Oh flower land so calmly grand
Where flowers chase the flying snow!
Oh, high-held land in God's right hand,
Delicious, dreamful Idaho!

We rode the rolling cow-sown hills,
That bearded cattle man and I;
Below us laughed the blossomed hills,
Above the dappled clouds blew by.
We talked. The topic? Guess. Why, sir,
Three-fourths of all men's time they keep
To talk, to think, to be of HER;
The other fourth they give to sleep.

To learn what he might know of love,
I laughed all constancy to scorn.
Behold yon happy, changeable dove!
Behold this day, all storm at morn!
Yet now 'tis changed to cloud and sun.
Yea, all things change—the heart, the head,
Behold on earth there is not one
That changeth not in love," I said.

He drew a glass, as if to scan
The steeps for steers; raised it and sighed.
He craned his neck, this cattle man,
Then drove the cork home and replied:
"For twenty years (forgive these tears)—
For twenty years no word of strife—
I have not known for twenty years
One folly from my faithful wife."

I looked that tarn man in the face—
That dark-browed, bearded cattle-man.
He pulled his beard; then dropped in place
A broad right hand, all scarred and tan,
And toyed with something shining there
Above his holster, bright and small.
I was convinced. I did not care
To agitate his mind at all.

But rest I could not. Know I must
The story of my stalwart guide;
His dauntless love, enduring trust;
His blessed and most immortal bride.
I wondered, marveled, marveled much;
Was she of Western growth? Was she
Of Saxon blood, that wife with such
Eternal truth and constancy?

I could not rest until I knew—
"Now twenty years, my man," said I,
"Is a long time." He turned, he drew
A pistol forth, also a sigh.
"Tis twenty years or more," sighed he.
"Nay, nay, my honest man, I vow
I do not doubt that this may be;
But tell, oh! tell me truly how."

"'Twould make a poem, pure and grand;
All time should note it near and far;
And thy fair, virgin, gold-sown land
Should stand out like a winter star.
America should heed. And then
The doubtful French beyond the sea—
'Twould make them truer, nobler men
'To know how this might truly be."

"Tis twenty years or more," urged he;
"Nay, that I know, good guide of mine;
But lead me where this wife may be,
And I a pilgrim at a shrine,
And kneeling, as a pilgrim true"—
He leaving, shouted loud and clear:
"I cannot show my wife to you;
She's dead this more than twenty year."

The Scots' Breakfast.

A writer in the Cincinnati Commercial Gazette remarks on the rapidly extending use of oatmeal in this country: Fifty years ago there was not a bushel of oats used in the United States for any other purpose than horse-feed. Now there are mills owned and run by millionaires in this and other States which are exclusively employed in making oatmeal for diet for men and women.

It is well known that this commodity has been a favorite food in Scotland and other parts of Europe over a hundred years. Bobby Burns in his poems more than once celebrates the virtues of "porritch." And yet so fixed are national prejudices that the use of a new article of diet, however desirable and meritorious, is slower than it ought to be; so that to find a family that has oatmeal on the table once every day is the exception rather than the rule in this country; and simple as the preparation of a good dish of the material is, one rarely meets a cook or a housekeeper who knows how to make it well.

During the Irish famine, some 30 years ago, we recollect that a cargo of corn, which was shipped from Marietta, Ohio, to Cork, and offered as a bounty to the poor people to prevent starvation, was rejected with scorn at first as food only fit for swine.

"Oats is only fit for horse-feed," say our scornful American youth; "for our part we are satisfied with beefsteak, boiled ham, eggs, hot-cakes and coffee." And thus they gorge themselves with viands and drinks which induce dyspepsia and other diseases in proportion as they are taken hastily and in excess.

The writer has partaken of many a good, satisfactory and nourishing breakfast on oatmeal and cream, and can warmly commend their use as producing brawny men and beautiful, healthy women. Physiologists and economists attribute much of the Scots' energetic and effective character to the hearty porridge on which their youth is mainly reared, and we are inclined to believe there is much in the claim.

DOMESTIC ECONOMY.

Home Canning of Meat.

[Written for the RURAL PRESS by M. A. S.]

F. B. Clayton in the RURAL PRESS of Nov. 19th asks the question "Is there any practical way that farmers can put up fresh meat in cans?"

Having eaten of meat put up in cans in a farmer's family six months after canning that retained its flavor and was as palatable as meat retailed fresh by the butchers cooked in the same manner, we will give F. B. Clayton the benefit of the knowledge we gained from the lady at whose table we first tasted home-canned meat.

The meat was fresh pork, mostly lean meat, cut up and roasted in a big dripping-pan, and properly seasoned with sage, pepper, and salt, enough water in the pan to keep it from scorching. When done the meat was separated from the bones and the meat packed in a tin can. Some of the grease was dipped off, the dripping-pan put back on the stove till the gravy boiled, and then poured in to fill up any interstices between the pieces of meat. Set the can on the stove for a few minutes, run the handle of a spoon on the side of the can to the bottom to make sure that all air is expelled; fill full and seal or solder on the cover, making sure it is airtight, same as in canning fruit.

Some made from the heads of hogs boiled till the bones come out easily, then chop coarsely, season to suit your taste and pack into cans. Have the liquid you have boiled the meat in strained, and heat to a boiling point; fill up the cans with this liquid, and, if sealed airtight, when opened months after it will make a palatable dish.

Beef and Mutton.

Take cheap pieces of beef—not fine roasts or steaks, but such as butchers cut for pot roasts. Take out all the bones and place meat in a flat-bottomed kettle with a little suet cut in small bits underneath, but omit the salt and pepper till you add the water. Let the meat fry till both sides are browned, cooking slowly with a tight cover over it for half an hour, turning it often to see that it does not scorch but browns nicely. Add to the meat a half-pint of hot water and the salt and pepper, and replace the cover, cook slowly till done, adding water a little at a time, as is needed. This is what is called by some cooks "smothered beef," and all the juices are retained. Can and seal up in the same manner as before given. When opened for use, when heating up add sweet herbs to suit your taste, and if your family are fond of gravies, when the meat and gravy has boiled up in your frying-pan remove the meat and thicken the gravy with scorched flour.

I think soup meat with the bones and fat removed, then the soup heated to boiling and poured in with the meat and canned, would doubtless keep good. It would cost very little to make the experiment.

If the soup stock was boiled down and well seasoned, when opened for making soup water could be added and the soup stock not injured.

The lady who gave me directions for canning pork said she had taken the fore-quarters of mutton, had the big bones and shoulder blades removed, the ribs cut across, backbone chopped, and put them in a big kettle with water sufficient to boil the meat, kept the kettle covered and cooked till she could remove the meat with knife and fork and done enough to pack closely.

She let the water cook away enough to leave only what she wanted to fill up the can, and after removing the bones returned the meat to the liquor and let it come to a boil before canning. She used the meat for stews and sometimes made a meat pie; as she lived rather isolated from a meat market, it was quite a convenience many times to have something in her storeroom she could put on her table at a short notice when visitors come in quite unexpectedly, as well as to vary the bill of fare for her own family.

There is a dish often seen on farmers' tables in my native State—New York—that I have never eaten on this coast.

But few of the farmers there patronize the butchers often, but raise and slaughter most of the meat their families consume on their own farms, depending on poultry and salt fish for a change.

The dish referred to is made from the heart, part of the liver, the tongue and lower jaws, of a sheep or lamb. These are carefully washed and put into boil with just enough water to cover, and boiled till tender, scum being removed soon as it arises. When done, take up and skin the tongue, remove the bones from the jaws, put all in a chopping-bowl and hash finely.

Strain the water in which the meat was boiled into a saucepan (should be not over a coffee-cup of liquor), add the chopped meat, pepper, salt, and butter to taste, thicken with flour. This is a fine relish with nice baked potatoes.

Some do not use the water but put a piece of butter in the saucepan, with the meat, adding a little parsley cut fine, with other seasoning, and stir it while it heats slowly. Serve smoking hot.

I will add another item that may be of interest. A good housekeeper gave me this method of canning sausage meat.

Her husband slaughtered his hogs and made

them into bacon, cured the hams and shoulders, because the price of hogs was so low he thought it more profitable to do this than to sell on foot.

She had such a quantity of sausage-meat they could not dispose of it, even after giving away liberally to her neighbors; so she determined to try canning. She had the seasoning ground through the machine with the meat at the rate of six ounces of salt, three of pepper (sage and thyme guesswork) to 20 pounds of meat.

She filled dripping-pans about half an inch deep with this prepared meat without adding any water, cooked till done, taking care to not let the oven get hot enough to scorch it. This meat she canned hot in the sausage gravy, sealed airtight, and it was a success, as I can testify. The meat was just cooked done, not dried up, and she said she used only the same care as in canning fruit to exclude the air.

YOUNG FOLKS' COLUMN.

Dreamland.

[Written for the RURAL PRESS by MARTHA T. TYLER.]

Say, have you passed through the kingdom of Nod,
Ever so far to a city that seems?
Blue are the roses and red is the sod,
Everything strange in the country of Dreams!

Flowers have faces and butterflies sing,
Frogs go a-fishing in crystalline streams,
Babies fly out of the bells when they ring,
Everything queer in the country of Dreams!

Pigs dance at picnics and trees take a walk,
Fussies do patchwork and spiders sew seams,
Mice are musicians and terrapins talk—
Everything odd in the country of Dreams!

Bottles wear broadcloth and spoons spin a top,
Ladies play leap-frog and tarriacs drive teams,
Dishpan's a damsel, who married the mop—
Everything droll in the country of Dreams!

Moon is meringue and the mountains are cake,
Sun is a giant plum pudding that steams;
Pie islands float in a lemonade lake—
Everything good in the country of Dreams!

How the Bears Helped One Another.

Bob Bruin was a good, young bear, that minded what his father and mother said to him.

"When you take a walk out of the forest," said Mr. and Mrs. Bruin to Bob, "don't go near those houses. Men live in them and they treat bears very badly."

"What do they do?" asked Bob.

"Oh," said Mr. Bruin, "sometimes they kill us and eat our flesh. Sometimes they tie a great log to our legs so that we cannot run."

"Ah," said Bob, "but I would bite them."

"To prevent that they would tie a great muzzle on your mouth; so keep away from them, Bob."

Bob promised to obey. But one day, while walking outside the wood, he fell into a pit. He roared so loud that Mr. and Mrs. Bruin came running out to see what was the matter. When they came to the pit, they saw some nuts, and fruit and buns lying on the grass. So they made a step forward to get these nice things, when down they went where Bob was, with the buns and nuts.

They found that the food had been laid on twigs and leaves across the pit, which was dug as a trap for them to fall into. But how to get out was the puzzle.

After a little while Mrs. Bruin got on top of Mr. Bruin's shoulders and so scrambled out of the pit.

"Now, Bob, you do the same, and I'll tell you how you may then help me out."

So Bob got out of the pit as his mother had done.

"Now," said Mr. Bruin, "go to the woods and bring me back a strong branch of a tree." They did so, and placed the end at the bottom of the pit.

"Now, hold the end tight on the top," said Mr. Bruin, "and I'll try and climb up."

So Bob and Mrs. Bruin held the branch at the top of the pit, and Mr. Bruin, who could climb very well, managed to scramble out of the pit.

They all went home again to the forest in safety, and had a long talk about men, and their tricks to catch poor bears in pits.—Selected.

THE LITTLE FOLKS. — A San Luis Obispo mother had occasion a few days ago to reprove her little boy aged four years. Among other things she told him that the angels in heaven were weeping at his conduct. The next day the little one again became unruly, and his mother scolded him soundly and made dire threats of extreme measures if he ever did the like again. "Mamma," at length said the four-year-old, "I think the angels up in heaven are weeping at your own self's conduct." That discussion came to an untimely end.—Tribune.

THE fine residence of J. H. Drummond, near Glen Ellen, was burned, with most of its valuable contents, Sunday night, Nov. 13th. The fire is supposed to have caught from a defective flue. The family had retired, and the flames had made such headway before they were discovered that there was little time to save anything except some jewelry and loose articles that could be picked up in a moment as the people were making their escape.

TABLE OF CONTENTS.

EDITORIALS.—A Grand Horticultural Event; Government Aid for Irrigation; Duke of Rothsay, 439
The Week; Eastern Grape Disease Not Here; Other Anarchists; San Luis Obispo County; A Good Word for Sorghum, 446. Progress in Mutton; The Japanese Walnut, 447.
ILLUSTRATIONS.—Imported Four-Year Old Clydesdale Stallion, Duke of Rothsay, 439. The Japan Walnut; Port Harford, San Luis Obispo Bay, California, 447.
CORRESPONDENCE.—Santa Ynez Valley, 440.
THE STOCK YARD.—Color in Shorthorns, 440
Salt for Stock; Horses and Handling, 441.
POULTRY YARD.—Marketing Eggs and Poultry, 441.
THE VINEYARD.—On Vine Pruning; Vine Pruning; Vine Pruning, 441.
PATRONS OF HUSBANDRY.—Santa Rosa Grange; For Discussion in the Grange; Anniversary Celebration at Sacramento; Pomona's Portrait; A Cotton-Picking Bee; A Rose by any Other Name; Worthy Master Overseer's Report; Our National Grange Display; Good Advice from a State Grange Committee, 444.
AGRICULTURAL NOTES.—From the various counties of California, 443.
THE HOME CIRCLE.—Smile Whenever You Can; Will She Marry; Temperance Text Books; Woman's Special Vocation, 444. On the Wing in San Mateo; That Faithful Wife of Idaho; The Scot's Breakfast, 445.
DOMESTIC ECONOMY.—Home Canning of Meat, 445.
YOUNG FOLKS' COLUMN.—Dreamland; How the Bears Helped One Another; The Little Folks, 445
QUERIES AND REPLIES.—Raising Trees from Seed; When to Cut to Kill Brush; Shipping Young Gum Trees, 447.
THE STABLE.—Horse Raising in Lucerne; Alfalfa as a Horse Feed; Breaking Horses, 448.
ENTOMOLOGICAL.—Codlin M th Remedies, 448
FRUIT MARKETING.—Other Hardships of the Shipper, 449.

Business Announcements.

Windmills—Pacific Manufacturing Co.
Agricultural Implements—Frank Brothers.

The Week.

The longed-for rain came at last in true style. A storm from the north working southward in the face of southerly surface winds. The amount of precipitation up to the time of our writing on Wednesday evening has not been great, it is true, but the general behavior of the storm is promising. We collate a few figures from this afternoon's dispatches, showing the rainfall to date at the following points:

	Inches.
Redding, Shasta county.....	1.20
Marysville, Yuba county.....	1.24
Gridley, Butte county.....	1.36
Woodland, Yolo county.....	.60
St. Helena, Napa county.....	3.20
Napa, Napa county.....	1.90
Santa Rosa, Sonoma county.....	2.77
San Francisco.....	1.25
San Mateo.....	1.55
San Jose.....	1.36
Sacramento.....	.33
Stockton.....	.71
Auburn.....	2.31

Some of these figures are probably not accurate, as they come by telegraph, and they are not large, but a little rain is a good thing

after so long waiting, and it serves to cheer and encourage the people notably. It is needed to quicken agricultural operations, to revive trade, and to supplement the activity which the flock of incomers inspire, with the assurance of production and prosperity. Let it go on.

Other Anarchists.

The last two years have witnessed an extraordinary interest in social science in this country. The faculties of the schools of political science at Johns Hopkins University, Columbia and Harvard Colleges, are publishing a series of valuable studies of American society, politics and jurisprudence. Other works in a kindred line are in process of preparation. The popular magazines have also taken up the subject, and thousands of citizens, who were a little while ago content to let things drift, relying on Providence to interfere at a critical moment, are now keenly watching social questions. They are aroused from the pernicious delusion which has so long prevailed, that the problem of government has been settled once and for all, and that there is nothing to do in these United States but to blow off rockets and Fourth of July oratory about once a year.

Now this increased interest in social matters augurs well. It will result in the perception of dangerous elements that have come to the surface of the body politic that should be promptly suppressed. When dangerous elements are spoken of, the majority of people naturally think of the German and Bohemian anarchists, and some labor organizations that have sought to have their own way and terrorize society by the boycott and other forms of violence. The recent lesson at Chicago teaches that the American people will never tolerate this shape of anarchy, but that they will mercilessly crush its authors whenever and wherever they shall present themselves. That they will make no changes in their institutions in obedience to threats of violence from any quarter, and while offering a generous asylum to all well-disposed people, will allow of no anarchistic experiment on our soil.

But we desire to call attention to another shape of anarchism that strikes quite as fatally at the life of government. What is an anarchist? It is a man who despises all restraints and would abolish government or limit its authority to the minimum. Properly speaking, a socialist is the opposite of an anarchist. The socialist desires to extend the authority and functions of the State so as to embrace all industrial enterprises and regulate all human relations. Both socialism and anarchism are born of discontent, and hence the two have been confounded. It is only just to keep this distinction in view. When the Knights of Labor advocate the purchase and administration of all railroads by the State, the tendency is toward socialism, but this is a very different thing from the nihilistic or anarchistic program. One tends to political despotism, the other to political anarchy.

But the analyst has not found the only form of anarchy in the Haymarket outrage in Chicago. He will find another expression of it in the management of the Standard Oil Trust, and monopolists of all kinds who desire to be left alone while they endeavor to evade or neutralize the law that protects society from their depredations. They differ from the Chicago anarchists in the use of different agencies. The poor, ignorant fanatical anarchist resorts to the bomb; the rich anarchist manipulates the law into a shield to protect his thieving schemes. He packs the political conventions. He buys the Legislature. He corrupts the channels of justice.

What, for instance, are the so-called trusts that have so alarmingly multiplied of late but an attempt to despoil society for the benefit of a few? They are extra-legal associations of capital, secret or semi-secret financial conspiracies, the object of which is to artificially enhance the price of an article by monopolizing its manufacture and exercising a policy of brutal force and terror against all possible competition. That this applies to the Standard Oil Trust goes with the saying, but the hundreds of millions it has abstracted from the wealth of the people without interference on the part of the State has naturally encouraged other unscrupulous business men to attempt a similar experiment. We have the Cotton Seed-Oil Trust, the Rubber Trust, the Cattle Trust, the Coal Trust, the Gas Trust, and many others, all of which

aim to gain the sole control of some indispensable article. It is clear if this tendency is not arrested the time is not remote when nearly every necessary of life will be at the mercy of unscrupulous capitalists who will not hesitate to enhance the cost of living.

The powerful lobby at Washington and capitals of the respective States demonstrates anarchistic tendency of capital. Hence extremes meet. The millionaire capitalist who undermines social order by forcing thousands of his countrymen to want and penury is no less reprehensible than his ragged colleague who harangues incendiarism from the top of a beer-barrel. The man who for private gain wages open or secret war against society has no claim upon the toleration or charity of those he despoils. He strikes at law, social order, the very existence of society. Surely it is the duty of society to protect itself against all such shapes of anarchy.

Eastern Grape Diseases Not Here.

What appears to be an official report on the grape diseases which Prof. F. Lawson Scribner did not find in California during his recent visit is telegraphed from Washington to the *Chronicle* over the professor's signature. It is, of course, but a point or two from the report which will be finally made, but it contains much that is satisfactory in that it confirms the statements already made by the State University experts that the downy mildew has not yet been identified in this State. We have pests enough and are glad to know that we have thus far escaped some.

It will be remembered by those who have the Government publications that in the map prepared to illustrate the report of the mycologist, California was included among the regions in which the downy mildew existed. Prof. Scribner gives this explanation of the matter:

Early in the season of 1886, a circular containing quotations relative to the mildews which attack the vine was sent out by this department to the viticulturists of the country. The replies to the circular from California asserted that the downy mildew or *peronospora* of the vine prevailed to an injurious extent in the southern part of that State, and also in the region north of San Francisco, and from the evidence the supposition of infected areas were indicated on the map, showing the distribution of this fungus disease in the United States, published in the report of the mycologist in the annual report of the department for 1886. By the direction of the Commissioner of Agriculture, the mycologist of the department visited the supposed infected districts in California during the past season, and, although careful observations were made, no evidence of the presence of the downy mildew was found. The disease which some of the viticulturists had supposed was the downy mildew had no connection whatever with that parasite, and the conclusions drawn were that it is very doubtful if this fungus occurs at all within the State. In view of this, it is strongly urged upon the viticulturists of California to exercise every precaution against the possible introduction of this parasite within their limits, for the injury it would occasion would be far greater than it is at present in any part of the Eastern States, as the varieties grown there are much more susceptible to its attacks.

It will be seen from Prof. Scribner's statement that the report that California had the downy mildew was based upon the circulars returned by some of our vine-growers. We can but caution our growers against trusting to casual resemblances between what they see on their vines and descriptions of diseases which they read. Sometimes appearances are "very deceiving" in plant diseases as in other affairs. We had the opportunity of examining a number of specimens sent in by growers as samples of downy mildew, and found they were altogether mistaken. The fungus they found was innocent as compared with the *peronospora*. We should be conservative in such matters. We have local experts who can detect such things, and when they declare that the sample does not contain the mooted pest, no report should be given which will lead into such incorrect publication concerning the State. We are sincerely glad that Prof. Scribner was sent to California, and thus enabled to assure us that we are not as badly off as some of us were led to think.

Another statement of Prof. Scribner is important, and that is that he saw no indication here of the black rot of the grape as Eastern growers understand it, and against which they have to coddle their clusters in paper bags. As we have said before, we have illa enough without borrowing others.

A Good Word for Sorghum.

While Mr. Spreckels is proceeding on his triumphal parade in the interest of the sugar-beet, it is interesting to note that sorghum, the old aspirant to the saccharine throne, does not forsake her claim. Indeed the plant comes forward with even stronger forces and stronger claims than hitherto. It is an interesting fact that the sorghum dynasty has survived three administrations of the Department of Agriculture, and the present incumbent has done more than his predecessors to demonstrate the fitness of the plant to cut a large figure in the home-grown sugar proposition.

Hon. N. J. Colman, Commissioner of Agriculture, believes that the experiments the past season at Fort Scott in Kansas have been completely successful, and have demonstrated the value of sorghum. He says that heretofore the method of milling the sorghum was defective, as not more than 25 per cent of the sugar could be extracted from it. He used in his experiment the German method of extracting the sugar from beets, which is called the "diffusion process," by which the cane is cut into small pieces about two inches long, and placed into cells upon which warm water is then poured. The water absorbs the saccharine matter of the cane, and this water is afterward boiled in a vacuum, when the sugar is granulated.

The experiments, Col. Colman thinks, will be to revolutionize sugar-making in Louisiana, and he says that the most advanced sugar-makers of that State have been at Fort Scott, where the experiments have been conducted, and were delighted with the results obtained there. He says that a sugar-planter shipped to him at Fort Scott, ten cars of sugar cane, and that he had obtained 150 pounds to the ton by his method of reduction, while the sugar-planter in Louisiana obtained only 80 pounds from the cane by the old-fashioned process.

The method of sugar extraction by the diffusion process has already been described in our columns. Last year the Department of Agriculture procured the best machinery, and the result is described by Col. Colman as stated above. Those who desire to pursue the matter further should apply to the Commissioner of Agriculture at Washington for his publications on this subject.

Postal Telegraphy.

In view of the extortions practiced by the telegraph monopoly, which has \$4 of watered stock for every dollar ever actually invested in their plant, it is refreshing to see how Hon. B. F. Shively, M. C. from Indiana, has just put himself on record respecting a postal telegraph in the *Washington Star*. He says:

I would propose that the Government commence by building an experimental line between New York and Philadelphia, and then, after a fair trial, extend the line to some other large city—say Chicago. Of course the telegraph would be in the Postoffice Department. I don't propose that the Government buy Jay Gould's watered stock—nothing of the kind. It would be only a question of time after the Government line was once started that Jay would offer his lines at a reasonable figure; but saying that the Government only established a telegraph system for its own business, and the people could patronize it if they desired, that would be a great benefit to the country. I can't see how intelligent people could say that a postal telegraph could be centralizing the power of the Government, because the people themselves would control it. I call it centralizing the power of the Government when these important adjuncts of the people are farmed out to corporations. I believe the question will receive a good deal of agitation in this Congress, and when the people come to realize the importance of the subject, you may depend on it that they will be in favor of the Government taking control of the telegraph.

It is reported, also, that T. V. Powderly is gathering information on the subject, and the Knights of Labor will throw their united weight into the scale to induce the National Government to establish its own telegraphic system.

ALL "BANDS."—The *Kansas City Indicator* avers that in California every collection of animals is called a "band." A herd of cattle, a flock of sheep, a party of Indians; anything and everything that walks—when seen in numbers—is known as a band, and it is regarded as a sure sign of being a tenderfoot to use any other term.

OROVILLE CITRUS FAIR.—As has already been noted in our columns, the citrus fair in Oroville, Butte county, will open December 20th and continue four days. The Southern Pacific railway announces that a round-trip excursion ticket from San Francisco to Oroville, good for four days, will be sold for \$5.10.

Progress in Mutton.

We notice indications that mutton is growing in popularity in this country, and that Eastern flock-owners are deriving some comfort from this fact amid the discouragement which overhangs the wool outlook. It is, of course, much more of an object to Eastern sheepmen who live adjacent to large meat-eating centers to have a popular opinion growing in favor of mutton than it can be to the wool-growers of the West, who could not find people enough to eat the mutton they can produce, no matter how fine it may be or how popular it may become. Still, anything good, no matter how distant, is encouraging, and it is within the possibilities that the progress noted may be quite wide-reaching in its effects.

Our attention is called to these facts by some remarks which our old friend Prof. G. E. Morrow of the Iowa Industrial University made at a recent meeting of the Illinois Wool-Growers' Association. In his address he alluded to the darkness of the wool outlook, but found some consolation even there. He claimed that wool only shows the depression common to most lines of agriculture. Wool is not relatively lower than wheat and beef. There is good prospect for some improvement; there has already been some. The reduction of flocks by some disheartened owners will help others. American wools are of high quality and will remain in good demand. Economy of production has been well learned. The average quality of many flocks has been improved by sale of inferior animals.

Wool-growers are sheep-owners. Constant recognition of this fact will help to profit. Sheep have three great purposes—to reproduce their kind, to produce mutton and grow wool. All three should be kept in mind in breeding. Breed for specific purposes; not always for a specific purpose. Good size and form are not opposed to a large fleece and good wool. The best wool is produced when the sheep are continuously well fed. It is not wise for the friends of any breed of sheep to neglect their mutton-producing capabilities.

Mutton is a healthful, nutritious, palatable food. Recent low prices have tended to increase its use. Americans are great meat-eaters. The use of pork is almost universal. There is reason to believe mutton may yet rank alongside beef. There is an increasing demand for good early lambs. Sometimes it will be wise to cross breeds to secure large lambs, but it will be a mistake to give up any of our well-established types of sheep.

These are some of the points made by Prof. Morrow. As we have said, they may be more applicable at the East than here, and yet, to a degree at least, the suggestions are valuable and practicable everywhere.

AN INCENDIARY LYNCHED.

—Oakdale, Stanislaus county, has suffered from a great many fires within a few weeks past. On the night of Friday, Nov. 25th, a boy 16 or 17 years old, of bad family and ill repute personally, was caught in the act of setting fire to a barn there, and confessed that he had been the incendiary in several other cases. While a constable was taking him to the Modesto jail, a band of vigilantes relieved the officer of his charge and hanged the culprit by the roadside.

THE FRAUDULENT SURVEYS.—The United States Grand Jury for the Circuit Court, previous to being discharged by Judge Sawyer last Saturday, found 15 new indictments in the Benson survey cases. According to a stipulation made when the former indictments were quashed, defendants will have the privilege of appearing in court without previous arrest by the U. S. Marshal, if they choose to avail themselves thereof.

BOGUS DIMES of 1887 are in circulation. The Marysville Appeal says their lightness and tinny appearance make them easy to detect.

The Japanese Walnut.

We gave a few years ago an engraving of the walnut *Juglans Sieboldiana*, one of the native walnuts of Japan, the representation being made from the fruit of a tree growing at Tower

THE JAPAN WALNUT—*Juglans Sieboldiana*.

house, Shasta county. For a long time the true name of this peculiar nut was not known, though it was grown and frequently sent to this city. If we are not mistaken it was identified as Siebold's walnut by Mr. G. P. Rixford of this city. After our publication of it the propagation of

thick as the black walnut. The meat is sweet, of the very best quality, flavor like butternut, but less oily, and much superior.

The experience with the tree in this State reaches over many years, as we have said, and is very satisfactory. We should like to know

that there would be considerable plantations to test its growth in various parts of the State.

THE CONVENTION OF NATIONAL EDUCATORS.—The Executive Committee of the National Educational Association has appointed a State

PORT HARFORD, SAN LUIS OBISPO BAY, CALIFORNIA.—See page 451.

the nut was undertaken by R. J. Trumbull and announced in his catalogue. We believe it was also given attention by other propagators. Its desirability made such an impression upon Luther Burbank of Santa Rosa, that he has grown a stock of it which he offers to the trade this year. The engraving on this page is a reproduction of one published by Mr. Burbank, and somewhat different from that we gave of the nut in the first instance. It shows a cluster of the nuts and inferentially the prolific character of the tree.

Mr. Burbank says the trees grow with great vigor, assume a handsome form, and are more admired than any trees on his place. They naturally take good shape without pruning, mature early and bear abundantly and regularly.

This species is found growing wild in the mountains of Northern Japan, and is, without doubt, as hardy as an oak. The leaves are of immense size, and a charming shade of green. The nuts, which are produced in extreme abundance, grow in clusters of 15 or 20, have a shell thicker than the English walnut, but not as

Executive Committee for California, as follows: State Supt. Ira G. Hoitt, Supt. F. M. Campbell of Oakland, Supt. J. W. Anderson of S. F., Inspector J. G. Kennedy of S. F., J. K. Wilson, Principal of S. F. boys' high school, Supt. N. W. Freisner of Los Angeles, and Supt. B. F. Howard of Sacramento. This committee will, it is understood, proceed at once to make all needful preparations for the July convention, in which work they have reason to expect the hearty sympathy and co-operation of the people, not of San Francisco merely, but of all California.

DESTRUCTIVE prairie and forest fires were reported last week in Illinois, Missouri, Arkansas, Indian Territory, Mississippi and Tennessee. Not California alone is scourged with wildfire.

A BOY'S CIGARETTE, dropped in the Union Cotton-Press building at Little Rock week before last, started a fire which cost \$200,000.

IOWA's dairy association reports 480 creameries and 66 cheese factories in that State.

QUERIES AND REPLIES.

Raising Trees from Seed.

EDITORS PRESS:—Some time since a correspondent wanted information relative to raising trees from seed, and seemed to think it takes a good deal of wisdom to do so. I have raised a few plants with little trouble, and in so doing proceeded as follows: I commenced last April, but understand the months of May and June are as good a time as any. Not caring to have moles or gophers work in my ground, however few plants I wanted to raise, I first dug below the surface and laid shakes close together on the bottom and sides, then filled in 2 or 3 inches with common earth, and filled up with creek sand till the shakes were buried about 10 inches. I then planted my seeds, acacia seeds, species unknown. I poured boiling water on and let the seed soak for 24 hours; then planted half an inch deep. (By the way, all acacia and most other kinds of tree seeds that are at all hard should be soaked in hot water before planting.) All these came up and are now nearly four feet high.

English walnuts I put (without soaking) about two inches deep. All came up; are now four inches high.

Eucalyptus (red gum) being very small seed, I simply had sand sifted on by hand to the depth of an eighth of an inch or so. They came up well; are now from 4 to 15 inches in height.

Osage orange seeds were soaked in warm water four or five days, but only a dozen out of 300 or 400 came up. Next time I shall pour boiling water on them. The plants are now from five to ten inches high.

I planted two or three kinds of forest-tree seed received from the State Board of Forestry, but for some reason, presumably my own fault, as this was my first experiment in seed-planting, they did not come up. I watered the seeds night and morning for two months or over, sometimes skipping a day if the ground seemed moist, and I think some of the seeds were kept too wet and so rotted. After some came up, I kept the ground free from weeds but did not try to loosen or in any way cultivate it; the bed was too small!

Some date stones procured from the ordinary dates sold in stores, I planted in sand a year ago, but they are only ten inches high now.

They had little protection during the winter, a sack being thrown over the box at night, when I thought of it, and would have done much better behind glass or under shelter some way. These were planted an inch deep, but half an inch will do better. As would be readily supposed, they need hot weather; some planted last June in a like manner on my sister's ranch in Fresno county have grown from eight to ten inches. My dates I watered freely, but my sister's did not get much water.

May is said to be the best time to plant seeds, but some put them in so late as August.

Do not be afraid of experimenting. It does not take much time, money or trouble to raise a few trees, and, if no one else can do it, the children should be permitted to try it. Permitted, I say, because their natural taste leads them to find absorbing interest in watching the development of seeds, and having something to call their own; something to take an interest in and care for will not only keep them out of mischief part of the time, but

tend to render them observant and thoughtful.

I, too, would be glad to receive hints on raising trees. I specially hope some one will tell the best way to raise grapevines for cuttings. Haywards, Cal. C. P. NETTLETON.

When to Cut to Kill Brush.

EDITORS PRESS:—I should be obliged if you or any of your readers can give me through your paper any information as to the best time for grubbing live-oak and other brush, so that any small roots left in the ground will die and not sprout again.—RUSTICUS, Lake County.

[There is so much clearing to do, now that wastelands are being taken up so generally, we would like to hear from all readers, who have had experience both on the point our correspondent asks about and all other matters connected with clearing.—EDS. PRESS]

Shipping Young Gum Trees.

EDITORS PRESS:—Doubtless your answer to B. F. H. is the correct one; still, if he thinks he cannot afford to pay freight on so much soil, let him soak it to a soft mud, knock off one or two sides of the boxes, and with fingers and hands remove the trees, with mud adhering

to the roots, and carefully pack all in a smaller box, in natural position; sprinkle sand or dust to fill among the roots; keep moist, roots and tops; set in moist soil, or, if dry, put a pint of water to a tree, and dry soil on top, to prevent baking; cultivate first year, when they should be five to ten feet high. It plowed a time or two the second year, it will tend to keep them thrifty, and abandon all hope of raising crops near them. They are the genuine real estate agents with immense stomachs, and will grow more firewood to the square inch than any known substance. Should they wilt at transplanting, pinch off the lower leaves.—S. P. SNOW, Santa Barbara.

THE STABLE.

Horse-Raising in Lucerne.

EDITORS PRESS:—The rapid and substantial growth of most of the cities and large towns of this State, in recent years, and the settling up of the country generally, have occasioned an active demand for good horses. Two classes especially always find ready sale at really high prices. Horses for heavy draft are much used for teaming both in the cities and on the roads of the country, and the supply of desirable ones of this class has not been equal to the demand for some years past in California.

Well-trained carriage horses, of good form and size, with a reasonable amount of action, have always been scarce, and often sell at seemingly fabulous prices, especially in the cities and larger towns of the State.

Many stockmen have engaged in horse-raising, and notwithstanding the good prices, have found it did not pay and given it up as unprofitable. This result arose either from the fact that they did not breed the right kind of horses or their soil and climate were not adapted to the business. The horse may do well in almost any climate; but if fed from the crib through the winter months, the expenses for feed and shelter largely tend to lessen the profits from his raising.

To raise the best horse at the least expense, after beginning with the right breed, the leading requisites are a mild climate and green feed the year round. And in these respects Lucerne enjoys at least equal advantages with any part of this State, and, I may confidently say, any part of the United States.

To say that the rattle of the mowing machine can be heard while clipping large fields of green alfalfa of abundant yield, as late as the 10th of November, would seem highly incredible to an Eastern farmer, particularly so to those accustomed to the rigorous winters common to New England. Yet such things are of common occurrence here; so much so, in fact, as to be scarcely noticed at all, except by visitors from abroad.

Mr. H. F. Pepys, whose farm is situated one mile southeast of Hanford, cut five crops of alfalfa from one piece of ground this season, the product aggregating over seven tons to the acre. In addition to this yield, the land will furnish good pasture for nearly four months before the time will arrive for turning his stock off preparatory to the gathering of other hay crops.

This is but one instance in many, and I speak of it merely to illustrate what can and is being done in the Upper San Joaquin, showing the wonderful fertility of its soil and its adaptations to stock-raising.

The winters are so mild that shelter for loose stock running in the fields is never thought of. Native grasses are abundant, and in horse-raising the colt from the time he is weaned maintains an uninterrupted and rapid growth until he reaches maturity, which period arrives one or two years earlier than in countries where young horses are kept through the fall and winter months on dry feed.

Some years since J. R. Heinlan of Lemoore imported his well-known thoroughbred stallion Baywater, and the production of some very fine families of young horses in Lucerne has been the result. One of these, a three-year-old, has a running record of one-half mile in 48½ seconds.

Geo. A. Dodge of Hanford has given considerable attention to the breeding of trotting and first-class carriage horses, and the results of his labors in these respects are highly gratifying; and it is but fair to say that he can make a showing in this line that would do credit to any horseman in the State.

The demand for draft horses of the Norman or Percheron breeds has been so steadily increasing that five years since, W. J. Newport, whose place is near Grangeville, imported a fine stallion of this stock direct from France, at the same time procuring a fine lot of brood mares. As a result, he now has a field of 80 young horses, which are perfect beauties in their line. At two years old they readily sell, unbroken except to halter, at from \$400 to \$500 a span.

Mr. John Newport, also of Grangeville, has experienced considerable success in breeding horses of the Clydesdale stock.

Rev. N. W. Matheral, who is not only a good preacher, but one of our leading farmers and breeders of fine stock, has recently purchased and brought to Lucerne the thoroughbred stallion, King Daniels, bred by John Arnett of Alameda county. This horse's pedigree shows him to be one of the best bred animals known to Amer-

ican horsemen, and he is certainly a valuable acquisition to the horse-breeders of Lucerne, and a special delight to lovers of speed in horseflesh. It is not the object of Mr. Matheral to breed fast horses for racing purposes. His logic is simply that the best of anything is always the most desirable.

Several hundred horses are shipped from Lucerne to various points by rail yearly, and it would seem that the larger the product the greater the demand. However, it is certain that horse raising is fast becoming a leading and profitable business with the farmers of Lucerne. A. F. JEWETT.

Hanford, Nov. 27, 1887.

[This is good. Now, will not readers in other sections let us know what they are doing with horses, and how they do it? We would like to have far more about the "noble animal" in our columns. Perhaps Rev. Mr. Matheral will give us a lecture on this subject.—EDS. PRESS.]

Alfalfa as a Horse Feed.

B. F. Johnson writes the New York Tribune: Intelligent and observant horsemen tell us the California two-year-old thoroughbred is, as an average, quite as well grown and as fully developed as the three-year-old of our side of the mountains. This, they say, is probably owing to the mildness of the climate and a green forage all the year round, if needed, that keeps a colt growing right along. These are, no doubt, good reasons; but possibly they do not embrace all of them. Has it ever been sufficiently considered whether the feeding of alfalfa (lucerne) green and dry may not have something to do with the rapid growth and size attained at an early age? We know there are no better pastures in the world for putting on fat and flesh than those of Kentucky, where blue grass abounds, supported by timothy and clover, red and white; and we know, too, that in spite of these advantages, Kentucky-bred stock is losing in size and weight every year, however it may gain in quality. And the same is to a certain extent true of the blue grass, timothy and clover pastures of the entire blue-grass region west of the Alleghenies and north of the Ohio river. In view of these several facts, will it not be worth while to try experiments with alfalfa and learn by actual trial whether it may not do for Eastern stock what it has done for that of the Pacific Slope—given it the lead in fast and fine horses, with other kinds of stock to be heard from later on?

[It will be a good thing to try it, but one need not expect to reproduce at the East all the California conditions which contribute to the rapid and magnificent development of the animal merely by growing alfalfa. The fact of the matter is, that even alfalfa owes its excellence here to local climatic conditions which cannot be transplanted. Alfalfa was grown in Central New York when we were there 15 years ago, but it was mighty poor alfalfa compared with what grows here.—EDS. PRESS.]

Breaking Horses.

EDITORS PRESS:—Salinas City has become a noted place in our State to procure fine horses. There is a general interest taken in breeding horses in this section. Prof. R. H. Tapp, whose work in handling wild and vicious horses has often been described in the RURAL, has erected a large tent on Main street, and has been for two weeks the main attraction in town. His system of breaking horses, or rather of educating them, is in keeping with the progress of this age. Among his class of scholars are noted horsemen and leading business men of Salinas valley. One could hardly believe unless he had seen the results of taming and breaking vicious kicking mules and horses by a system that is founded on reason and common sense. There is no cruelty, no drugs and opiates, and no deception; it is simply teaching the horse that he must subject his will to man, his friend and master. Quite a number of horsemen and large breeders of fine horses expressed their unqualified approval of Prof. Tapp's way of educating and subjecting horses to the will of man, and believed it would be a benefaction to the State if the columns of the RURAL PRESS would give an extended and minute description with illustrated cuts of this system. H.

Salinas, Cal.

A HIGHLY COMPOSITE STRUCTURE.—The "Slim Contributor" of the Salinas Index lately took an inventory of a pre-emptor's cabin in the Upper Cholame valley with the following result: Size, 10 by 16; constructed with 1 "King of Pain" box, 3 coal-oil cans, 1 Chronicle gun-cover, 5 slabs, 7 boards, 6 pine poles, 271 broken shakes, 1 canvas horse-blanket, 2 old sheets, 13 barley sacks, 2 old blue denim pants, 1 piece canvas, 23 shingles, 2 cracker-boxes, 4 Pearl oil-boxes, 1 Singer machine table; lined with old Chronicles, Examiners, Salinas Indexes, San Miguel Messengers, San Luis Obispo Tribunes, Wasp, Weinstock & Lubin catalogues. It was built with such mechanical skill that it is warm and sheds rain.

ENTOMOLOGICAL.

Codlin Moth Remedies.

An essay read at the Santa Rosa Fruit-Growers' Convention by W. G. Klee, State Inspector of Fruit-Pests.

During the last year considerable experience in regard to the arsenical remedies or poisons has been gained, and, although we have by no means mastered the subject, we have learned a great deal in regard to their application.

Strength of Compounds.

In bulletins issued by me this spring, the strength of solution was left rather indefinite. Later on, in a bulletin issued after the Riverside Convention, it was given at 1 pound to 180 gallons, as it was ascertained that all the samples that were procured in San Francisco market contained a very high percentage of arsenic, four samples averaging about 54 per cent of arsenious acid. If this percentage could be depended upon, the 180 gallons to the pound would probably be the average, although, as will be seen later, this strength has proved too strong in some cases. At any rate, it is to be urged that a manufacture on a small scale, which could be depended upon, be established, or that a large quantity be bought—to be uniform in strength—in the East and guaranteed by the manufacturers.

The Same Strength Affecting Different Varieties.

In my experience with the spraying early this season, it was learned very soon that different varieties of fruits were affected differently. Thus, I learned that as a general thing pears were less affected than apples; still there were exceptions to this also. Of common varieties, the Bellflower on my own place in Santa Cruz proved, for instance, very susceptible to the strength, 180 gallons to the pound, causing leaves and fruit to drop. Rhode Island greening was also considerably affected, but still made a fair crop. Mr. Trumbull of San Rafael and W. W. Brier of Centerville report the same result. On the contrary, the White Winter Pearmain was not affected, except a few leaves being burned on the edges.

The general spraying of my orchard was done the first time when the tree was well out of bloom, and the second time ten days later. A few trees, with the fruit just in bloom, were tried very early in the season, although a solution of Paris green—1 pound to 55 gallons—was used, and of London purple of similar strength, the effect of this strong solution was not more noticeable than that of the later week's sprayings and did not affect the fruit of either White Winter Pearmain apple or Howell pear, on which it was used. The explanation of this phenomenon must be that the surface presented by the leaves at this early date was much less than later on, when the weak solution was used, and that the rapid growth of the leaves dispelled the arsenic from its surface before it had time to act. This seems also to indicate that the fruit blossoms are much less affected than the foliage.

Effects Increased by Moisture.

That the effect of arsenical mixtures would be more severe in a climate where damp nights prevail, I became convinced of early in the season, and in my circulars of inquiry tried to elicit some confirmation in this respect, but failed to get it. My reason for concluding this was, that in the case of the Bellflower when the trees were located so as to dry off early in the day the ill effect of Paris green was much less. Thus, from an outside tree we harvested from the less shady side of the tree five boxes of apples, while from the side facing the next tree in the row and surrounded on all sides by other trees, hardly an apple was taken, and while a portion of the tree in question produced so well, 30 trees adjoining and of the same side and same variety produced but very little—in fact only ten boxes altogether. It seems, therefore, that the moisture which naturally would remain longer in the more shaded part of the trees and the orchard as a whole, has the effect of leaching out the arsenic from the Paris green, and thereby damages the foliage or the fruit spurs, causing the leaves to fall, and the fruit in consequence thereof.

How Long Does the Effect Last?

In this connection, the question naturally arises, How long does the effect of the poison last, and how long will it prevent the fruit from being attacked?

From personal observation in Santa Cruz mountains, we believe that the effect of Paris green will last about two months, having seen it plainly where a heavy dose has been used, and no successful attack of the worms was made before that. As regards the London purple, Mr. G. W. Ousley of San Jose, who experimented last year, wrote to me under date of August 16th, this year: "From close observation, it is my impression that London purple if used every 30 days will prove very effectual; but it will have but little, if any, effect after 30 days from date of using. In accordance with this, I have sprayed my pears four times with London purple, 160 gallons to the pound. No injurious effect on foliage and trees." Shortly after this I visited Mr. Ousley and found his pears almost entirely free, and he informed me that he had noticed an increase of worms the last two times he had sprayed.

As I must confess that I would hardly regard fruit sprayed so many times as safe to eat with-

out a test for arsenic, three samples of pears, Bourse Clairgeau, Bourse Bosc and Winter Nelis, were forwarded for analysis to Berkeley, and also a sample of apples furnished by Mr. T. C. Settle of San Jose, which likewise had been sprayed four times. The result of this analysis was that not the slightest trace of arsenic could be found. From this we would naturally conclude that no danger would exist from even four treatments with London purple, if rightly and carefully applied. On general principles I should, however, hesitate to recommend such an excessive use.

Analysis of fruit sprayed twice with Paris green has given no reaction, and if done early and carefully we believe is safe to the consumer; but the eating of fallen fruit should be most thoroughly guarded against during the first two months after spraying.

From what I have mentioned above in regard to the effect of moist nights on trees treated with Paris green, it would seem that in such localities the least danger of poisoning to the consumer could result from spraying, as the trees themselves would suffer if used too strong, each part of the tree which received too much naturally shedding its fruit, and, so to speak, refusing to take more than a weak dose.

London Purple vice Paris Green.

From observation in various parts of the State, I am confident that the case of London purple versus Paris green stands thus: The effect of London purple is more severe on the trees generally; and naturally, on account of its greater solubility and less poisonous character, less dangerous to the consumer if used only twice; but its effect as a protective compared with the Paris green is less lasting, everything being equal. It seems to be more applicable on pear trees than on apple. We believe that none of the compounds, if used carefully, are of any danger to the consumer, and that they are of much benefit to the raiser.

The present season has been, according to all accounts and personal experience, less productive of the codlin moth, especially in early part of the season. Not only does this hold good in the coast counties, but also in the interior counties of the State. The effect of the spraying with Paris green has, therefore, been less noticeable. As a general thing, the first brood of the moth was quite scant, yet exceptions to this occur, as, for instance, in the locality where my orchard lies, where early apples in July were badly affected, and the clean condition of all my early fruit must, therefore, be attributed to the spraying which in this case was done only once; and in August and September there was, at least in many of the coast counties, a great increase; so much so that parties reporting at the end of August only one-fourth affected, changed it to only one-fourth saved. This was the case when only one spraying of London purple was made.

In my own orchard the results have been very satisfactory, and stand about this way: Early varieties, sprayed once; Alexander, Early Harvest, Gravenstein, not one per cent affected; fall apples, as Greening, this being the worst, sprayed twice—½ infected; Bellflower, 3 to 4 per cent; W. W. Pearmain, 2 to 3 per cent; Newtown pippin, 4 to 5. It should be mentioned that bands were used all the season.

An experiment to settle definitely the proportion that could be saved by spraying was undertaken at the University this season and has been going on all summer under Mr. Wickson's supervision, and was reported upon by him in University Bulletin, No. 75.

As regards the whale-oil soap and sulphide of potash, or soda, recommended by me this season, I am very favorably impressed with its effect, so much so that I intend to spray a large portion of my orchard with it next season. Five good-sized Winter Pearmain trees treated three times show hardly the presence of any worms. As this remedy is perfectly innocuous even if not quite so effective, I shall prefer it for my own use, and where three sprayings are practiced, I certainly should adopt this as the third. In this regard I have come to the same results as the late M. Cooke. W. G. KLEE, State Inspector of Fruit Pests.

THE Pleasanton Stock-Farm Co. has been formed to breed, raise, buy, sell and own live-stock; to purchase and hold real estate, and also improve and sell the same. The capital stock is \$100,000, with \$1250 subscribed, and H. I. Thornton, Geo. F. Gordon, W. S. Stone, W. McAllister, Jr., and E. B. Young (all lawyers) as directors.

THE hinny is the hybrid offspring of a male horse and a female ass. They are said to be very easy-gaited saddle animals. In Southern Europe they are highly prized and held at large prices. They are bred to some extent at Palmer Lake, Colorado, for ladies' use and the Denver market.

AN auction sale of 81 registered Spanish Merino ewes recently held at the farm of W. J. Gage, South Lyon, Mich., brought an average of \$6.75 per head. The highest price realized was \$15.75.

THE Georgetown Gazette denies the truth of the report that Walker Bros. of Salt Lake have bought the Fairchild ditch in El Dorado county.

EXPERIMENTS are being made by the Western Railway Weighing Association, Chicago, in weighing cars of live-stock while in motion.

FRUIT MARKETING.

Other Hardships of the Shipper.

EDITORS PRESS:—In your paper of November 26th you publish a statement from Capt. Weinstock in reference to freight charges on fruit eastward. The captain deserves much credit for his effort, but permit a "sufferer" to extend it a little. While the captain points out that the railroad companies charge \$400 to Chicago and New York on fast shipment on a ten-car train to Chicago, it is not clearly shown that the railroad company charges on that train virtually \$3500 to Chicago, and therefrom on five cars \$500 to New York, or else the railroad company will take ten cars to New York for \$4000, or ten cars to Chicago for \$4000; or ten cars to Chicago, and reship five of them to New York, for \$4000; or if but one or more, but less than five, are reshipped, the railroad company charges, I believe, the \$4000 to Chicago, and adds \$200 to each car. Now, where is the justice in that? But this does not complete our wrongs.

Captain Weinstock, no doubt, unintentionally omitted another fact equally as important to a large proportion of us fruit-growers and shippers, viz.: Mr. Towne, at the time the captain refers to, also agreed that the slow freight rates should be reduced to \$200 per car. Has that been done? No; \$250 has been charged, and while a reduction of \$50 per ton has been made, the freight has been kept two to four days longer on the road than last year, causing thereby heavy losses to shippers—in many instances not only the loss of the entire shipment, but, as a positive fact, several hundred dollars a car additional for freight, boxes, paper, packing, etc.

Now, Mr. Editor, the thoughtless will ask, why don't those parties ship fast freight? Let me answer that. It is simply because they cannot afford to do so. They are taking their chances on an eight or nine day trip to Chicago as last year, but behold, it takes no less now than 11 days and from that to 14 days, if no accident happens. But that does not yet wholly answer the inquiry. Therefore let me inform you that fruit shipped to compete with Eastern fruit, say the Bartlett pears, which were selling at three cents a pound, and peaches which were selling there at about three to five cents a pound, as this year, cannot afford to pay a railroad rate of 2½ cents per pound, boxes, paper, etc., one cent more—and even after these are gone they have to compete with Eastern grapes, fall and winter pears. I saw a letter from Kansas City, Mo., to a shipper here wherein the consignee stated: "This return is no doubt unsatisfactory, but York State pears are selling here for \$1.40 to \$1.50 per half barrel, containing 75 pounds net weight of pears, and we cannot get much more."

This does not embrace all the complaints that could be justly made, as for instance, a car of fruit is jammed on the road. It is delivered to the consignee, and though the fruit does not cover expenses, the railroad company pays nothing, but collects every cent from the poor shipper. Another instance: Fruit is stolen from the car by railroad employes while in transit. The railroad collects freight for the amount of weight that left the shipper (he is lucky if not more), but delivers the consignee empty boxes instead of full ones, and he seems to have no remedy. This is something in which not only every fruit-grower is interested, but the whole community is likewise.

FRUIT SHIPPER.

Get Land! Get Land!

EDITORS PRESS:—Get land. Joaquin Miller is eminently right. Get land. To the man of money I say, "Get land." To the landless I say, "Get land." To the speculator I need not say it, get land. Even to the gentler sex, if she have a little spare capital, get land. Have something that is substantial and that is your very own. To the man or woman who has children, get land, and their children and children's children will rise up and call you blessed. To the bachelor I say, "buy land," and the day may move on to the hour when you will no longer be a mere cumber of the earth. To maid and mother, son and father, daughter, cousin, aunt and nephew, I say, buy land, and feel that you own an interest in this fair world. Get land, and have at least a spot of earth upon which to deposit your last of earth when the inevitable scythe shall sweep you hence. Get land! Get land! Get land!

But I am sure Joaquin Miller will permit me to add a word of caution. Do not invest all in land. Leave out at least a nest-egg. Have spare means, so that if land falls to a fourth of its present value, it will not seriously distress you. I have seen many a man in the Western States who was "land-poor." I once worked at day's-work nearly all summer, and did not get money enough to pay my taxes on land. Plenty of "trade," but no cash, I have land in Kansas now, not worth so much as 13 years ago, when I left the blizzards and ague for sunny California. My father bought land in Ohio in 1805, when Cleveland was a dozen log houses and Cincinnati in the dim, indistinct future; 35 years after it was worth but little

more than he paid for it, and he had paid taxes all those dismal years. True, Ohio is not California; Kansas is not California; the Western States are not glorious California; but be cautious, be discreet. The present boom will not last. There will be a reaction. Sure as fate. Land will never go back to prices of a few years ago, but it will recede—possibly distressingly so. Nevertheless, get land, get land. I end as I began—get land, get land, and never let go a handful of sand.

S. P. SNOW.

Ladies' Costume.

The attractiveness of the costume lies in its superb method of adjustment, and the novel and gracefully diversified outlines of its drapery.

LADIES' COSTUME.

Mixed blue-and-gray suiting, blue velvet and gray Surah are very tastefully associated in the present instance, the decorative adjuncts comprising Surah, facings of the velvet and Kurscheed's Standard reverse braid, the latter corresponding with the velvet in color. Five rows of braid trim the front and side gores of the skirt, which hangs well, and is given the customary proportions allowed the standard style. The front drapery is provided by the right front of the over-dress, being draped artistically high on the right hip by upward-turning plaits on the right side edge, and reversed at its left side to form a graduated revers, the reversed portion being smoothly faced with velvet. The left front extends in deep basque length, and the closing is performed in a straight line from the neck to the bust, below which the right front is extended to lap in double-breasted style nearly to the lower edge of the left front. The top of the drapery at the left side of the front sews to the lower part of the basque front, and its attachment is concealed by a disposal of braid. Double bust and single under-arm darts in each side of the front and side-

bodies, and a curving seam at the center of the back, are used in fitting, the back extending only to short basque depth. Upon the back is attached the ample back drapery, which is turned down over its seam at the top, and descends almost to the lower edge of the skirt-breadth. Its graceful folds are produced by deep plaits and bournous loops, all of which come at the top. At the right side this drapery is turned over in a graduated revers that is neatly faced with velvet. Upon the fronts, reaching from the neck to the bust, is arranged a plaited chemisette ornament, which is pleasingly revealed between the inner edges of a velvet shawl collar. A standing collar of Surah is at the throat, and inside it is a batiste ruche. The coat-shaped sleeves are trimmed with a row

WHERE TO BUY PIANOS.

Each Piano on our list is SELECTED for PARTICULAR MERIT, and every one the Best of its class.

General Agents for the New Model Gang.

A Plow fully up to the demands of the times, and SURPASSING ANYTHING in the Plow line EVER BROUGHT OUT, in simplicity and neatness of construction, ease of management, lightness of draft, and adaptability to all kinds and conditions of soil.

It is NEW IN DESIGN, neatly and substantially put together, and operated with a single lever, which raises and lowers the Plow and levels it at all depths. The operator walks beside the Plow, on the unplowed land, or behind in the furrow, as preferred, in easy reach and control of both the Plow and the team.

ITS ADVANTAGES are very apparent to every practical farmer; more and better quality of work can be done, a more uniform depth and width of furrow made, with lightness of draft and ease of management under all conditions of soil. Especially when the ground is hard and dry does it show its superiority to the greatest advantage—sticking to its work and turning a 16 inch furrow as deep as may be desired, and with as light, or lighter, draft than any 14-inch hand plow. The harder the ground, the greater difference in its favor.

IT IS VERY NEAT and substantial in its construction. The beams and wheels are of steel, and all castings of malleable iron, giving at once lightness with great strength and durability.

The shares are so made that they will cut full width until completely worn out. The team is hitched directly to the beams, close to the work, and, having no tongue, it will plow as close to the fence at the end of the furrow as an ordinary Plow, and is turned as easily as a sulky; in fact, it is so easily operated and controlled that a boy can handle it readily.

The McSHERRY GRAIN DRILL,

THE BEST, MOST RELIABLE AND LEADING DRILL.

WITH ITS UNRIVALED FORCE FEED

It sows all kinds of Grain and Grass Seed, Oats and Barley as well as Wheat, and SOWS MORE REGULARLY than any other Drill, whether the grain be large or small-sized. IT DOES NOT BUNCH, break or crack the grain.

IT CAN BE REGULATED IN A MOMENT to sow any desired quantity per acre, with CERTAINTY of getting that quantity in the ground.

IT NEVER CHOKES UP in the feeding arrangement, as is the case with Drills regulated by rendering the discharge openings larger or smaller. IT SOWS EQUALLY WELL ON ALL KINDS OF LAND, hilly or level, and it is immaterial whether the horses are driven fast or slow. This Drill must and does sow the same quantity of seed with each revolution of the feed wheels.

IT SOWS ALL THE GRAIN OUT OF THE HOPPER, and with the same evenness and regularity when the last grains are going out as when the hopper is full.

It has High Wheels with Wide Tires, giving great bearing surface on the soil, and enabling the Drill to pass over the loosely pulverized earth lightly.

It has Long Hoes of improved style and shape, with strong, wide, and polished steel points, working well in any soil.

State Horticultural Society.

The regular meeting of the State Horticultural Society, November 25th, was presided over by Vice-President A. T. Hatch.

The secretary reported that the receipts for the year were \$222.50, and that an unexpended balance of \$150 remained in the treasury.

Mrs. J. M. Dyer and H. E. Amore of San Francisco, and N. G. Rogers of Los Gatos were elected to membership.

The name of ex-Governor George Stoneman of San Gabriel being proposed, the rules were suspended and that gentleman was elected a member of the society by acclamation.

The subject for discussion was California seedling fruits, which was opened by Secretary Wickson, who read a number of papers touching upon various fruits which had been mentioned in various records of past years, and which embraced many inquiries as to the identification of the same. As the reading progressed these inquiries were taken up and frequently answered by the members, and where the same fruits in various localities were known by different names, the society by a vote determined upon the proper designation.

For instance, the apple heretofore known as "Skinner's seedling" and "Santa Clara County King" hereafter will be officially called by the former name; the Peach called "Cook's seedling" and the "Sonoma seedling" will be known by the former appellations. The "Marshall seedling" or "red bellflower" will be known as the "Marshall red."

Notes of the discussion during the reading of the essay were taken, and we expect to present the matter in our columns as soon as possible. Mr. Wickson is writing a book on California fruit-growing, and desires all possible information on California seedlings, that it may be presented in condensed form in the book. For the purpose of further discussion and drawing out more information, the discussion on seedlings will be published in the RURAL. The subject was not finished at the November meeting and was, by motion of Mr. Stabler, made the first order of business for the December meeting. The "marketing of fruits" was also chosen for the December meeting, and R. B. Blowers and L. W. Buck were invited to open the discussion.

An Appeal to Congress.

The following resolutions were offered and adopted:

Resolved, That this society cordially indorses the resolutions passed at the late Horticultural Convention at Santa Rosa relative to legislation bearing on horticultural interests; and be it further

Resolved, That we ask and earnestly request our delegation at Washington to urge the provision for the endowment of experimental stations, so as to make it applicable to the current fiscal year, as was originally intended by the insertion of a clause in this session's "urgent deficiency bill."

The resolutions referred to as passed by the Santa Rosa convention were:

First, asking Congress to appropriate money to carry out the Experiment Station law.

Second, asking that the Government appropriate an adequate sum of money to be used by the Division of Entomology of the Agricultural Department for the following purposes: To send an entomologist to Australia, New Zealand, and adjacent islands, the native countries of the white scale-bug (*Icerya purchasi*, Maskell) and of the red orange scale (*Aspidiotus aurantii*, Maskell), to search for and study the habits of parasites and predaceous enemies of the said insects; to collect, import into the United States, propagate and distribute in infected districts such natural enemies of the pests mentioned.

Third, to make efforts to have the United States import duties on green and dried fruits, nuts and oils maintained.

BERKSHIRE SALE.—The last account of transfers of thoroughbred Berkshires, sent us by Phil. M. Springer of Springfield, Ill., secretary of the Berkshire Association, includes the sale of "Lady S," "Redwood Chieftain," "Redwood Belle" and "Redwood Lassie" by Andrew Smith of Redwood City, San Mateo county, to Thomas Waite of Brighton, Sacramento county.

A ROSE BY ANY OTHER NAME.—In "W. W.'s" notes from Contra Costa last week, Prof. John Swett appeared again and again as "Swett." Had our faithful proof-reader been long resident in California, the types would not have so disguised our famous veteran teacher.

San Luis Obispo County.

The advent of the railway to San Luis Obispo has opened up this arcaid region and produced a lively influx of people. The climate, lands, and healthiness of this county will compare with the most favorable sections of the State.

San Luis Obispo has a capital water supply, which is drawn from the creek of that name. This stream also serves as a very efficient open sewer, carrying away the refuse of the town in a very inexpensive, but it would seem satisfactory manner. The conformation of the country surrounding the place is attractive from a scenic standpoint, and numerous beautiful and productive valleys exist in its immediate neighborhood.

The Pacific Coast Steamship Company has now a narrow-gauge railway from Port Harford to San Luis Obispo. It is nine or ten miles in length and passes through a rich country. At the former place there is a fine wharf, from which heavy shipments of beans, grain and dairy products are made to San Francisco. This roadstead is finely sheltered by a range of mountains and by the configuration of the bay. A comparatively trifling outlay would make an effective breakwater and convert Port Harford into a good harbor. An appropriation has recently been procured to erect a lighthouse there, and this will be a great convenience to commerce. The benefits which would follow the erection of a breakwater are almost incalculable.

The Pacific Coast Steamship Company has also built a narrow-gauge road as far as Los Alamos through the most famous bean and dairy country of Southern California. It is understood that the enterprise of the company has proved profitable and that they are making money. The time is not far removed when San Luis will have several transportation strings to her bow, and she cannot fail to thrive immensely in consequence. Our illustration (see page 447) shows the landing-place for the steamers of the Pacific Coast S. S. Co., at Port Harford, San Luis Obispo bay. This is one of the best harbors on the coast of California south of San Francisco. A very large business is done on this wharf, as it is one of the principal shipping points of the products of San Luis Obispo and the northern part of Santa Barbara counties.

TRINITY COUNTY complains that Shasta and Humboldt sheep depasture her ranges, and the Supervisors have passed an ordinance requiring every sheep-grazier to take out a license, under a penalty of \$200 for each failure to comply therewith.

THE BEET BOOM.—The Oroville Register has been keeping count of the fields that would be planted to sugar beets in case a factory is located near enough, and finds 947,943 acres of suitable land ready to be sown to the saccharine vegetable.

The Weaker Sex

Are immensely strengthened by the use of Dr. R. V. Pierce's "Favorite Prescription," which cures all female derangements, and gives tone to the system. Sold by druggists.

Do Not Think for a Moment

That catarrh will in time wear out. The theory is false. Men try to believe it because it would be pleasant if true, but it is not, as all know. Do not let an acute attack of cold in the head remain unsubsided. It is liable to develop into catarrh. You can rid yourself of the cold and avoid all chance of catarrh by using Dr. Sage's Catarrh Remedy. If already afflicted, rid yourself of this troublesome disease speedily by the same means. At all druggists.

Advice to Consumptives.

On the appearance of the first symptoms—as general debility, loss of appetite, pallor, chilly sensations, followed by night-sweats and cough—prompt measures for relief should be taken. Consumption is scrofulous disease of the lungs; therefore use the great anti-scrofulous, or blood-purifier and strength-restorer—Dr. Pierce's "Golden Medical Discovery." Superior to cod liver oil as a nutritive, and unsurpassed as a pectoral. For weak lungs, spitting of blood, and kindred affections, it has no equal. Sold by druggists the world over. For Dr. Pierce's treatise on consumption, send 10 cents in stamps to World's Dispensary Medical Association, 663 Main St., Buffalo, N. Y.

Washing Made Easy.

The King of Soaps makes washing easy.

APPLE BLOSSOMS may now be seen on a tree at 219 Eddy street, in this city.

Jackson Centrifugal Pumps.

JACKSON

Automatic Expansion SELF-OILING ENGINES.

Made in ten sizes, from two to sixty-horse power, and carried in stock for prompt delivery

"ECONOMY" PORTABLE BOILERS. MOUNTED ON SKIDS. 2½ to 20 H. P.

BYRON JACKSON,
625 Sixth St., San Francisco, Cal.

For quantities of water not less than 100 gallons per minute, and for lifts not exceeding 100 feet, there is no better pump than that illustrated in the annexed engraving. It is very simple, durable, and economical. I make them in sizes from 2-inch, 100 gallons per minute, to 24-inch, with a capacity of 14,000 gallons per minute, and am prepared to build larger sizes to order. They must be set within 20 feet of the water; will draw it that far and force it up 90 feet. They are very satisfactory in wells not over 100 feet deep.

COMPLETE Power and Pumping PLANTS A SPECIALTY.

WEST COAST LAND COMPANY.

SAN LUIS OBISPO COUNTY FARMING LANDS. 21,000 acres, representing \$600,000, sold in 14 months. to Nov. 1, 1887, to 260 settlers:

From New York.....	6	From San Luis Obispo county.....	34
" Minnesota.....	9	" Santa Clara county.....	34
" Colorado.....	8	" San Francisco.....	41
" Michigan.....	4	" Los Angeles county.....	17
" Texas.....	5	" Monterey county.....	6
" Kansas.....	5	" Other counties.....	48
" Iowa.....	11		
" Other States.....	24	Total from California.....	184
" Canada.....	4	Total from other places.....	76
Total.....	76	Grand total.....	260

43,000 acres of Vine, Fruit, Olive, Fig, and Farming Lands, being the balance of the Company's property, are for sale at \$10 to \$35 an acre, on same terms— $\frac{1}{2}$ cash, balance in four equal payments on or before 2, 3, 4 and 5 years; interest, 8 per cent per annum

Parties who have purchased are building, fencing, planting olives, vines for wine and raisins, fruits, figs, wheat, oats, barley and all other products adapted to the soil and climate.

These lands are located in San Luis Obispo county on the Salinas river and are traversed by the Southern Pacific Railway for 15 miles, affording near market to all parts. All lots have timber for domestic use, and good water at 20 to 40 feet. There is living water in springs and streams on many tracts and sufficient rainfall throughout, requiring no irrigation.

Templeton, Cal.

\$250.00 Free! Free!
A GREAT OFFER.

In order to extend our list of names, we will put into a box a card bearing the name of each person who sends us the names and post-office addresses of ten young gentlemen or ladies between the ages of 15 and 25 years, who would be likely to attend a Business College or Normal School. These names must be sent in before the 4th day of February, 1888. On that day Messrs. Trask & Ramsey, in the presence of the whole faculty of the Business College and Normal Institute, will draw out the names of five persons, to whom will be presented the following scholarships. These scholarships will entitle the persons to whom they are issued to instruction in the largest and best conducted private school on the Pacific Coast.

BUSINESS COURSE, six months, \$50.
SCIENTIFIC COURSE, one year, \$50.
SHORT-HAND AND TYPE-WRITING, 6 months, \$50.
NORMAL COURSE, one year, \$50.
TEACHER'S REVIEW COURSE, nine months, \$50.

CONDITIONS.—Applicants for any one of these five scholarships must be between the ages of 15 and 25 years, and must not be residents of Stockton.

A person drawing either one of these scholarships can have his choice of either of the five courses of study named above.

Write your name and post-office plainly, and state which one of the scholarships you are an applicant for.

S. F. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Nov. 30, 1887.

Rains the past week have caused a more hopeful, cheerful feeling. More active outdoor work is reported, with plowing becoming quite general. As the supply of cereals, hay, etc., in farmers' hands is light, they are not affected, the usual changes brought in by the rainy season. In wheat the Eastern and European markets have ruled fairly active, with values well maintained, contrary to the usual run of seasons, for, as a rule, prices weaken toward the close of the year. To-day's cable is as follows:

LIVERPOOL, Nov. 30.—Wheat quiet but steady. California spot lots, 6s 7½d to 6s 10½d; off coast, 3s 4½d to 3s 5d; just shipped, 3s 4½d; nearly due, 3s 4½d; cargoes off coast quiet but steady; on passage, buyers have made a pause which, however, will probably only be temporary; wheat on passage to Continent, 1.45, 0.00 qrs; wheat and flour on passage to U. K., 1.45, 0.00 qrs; French country markets, firm; wheat in Paris, steady; flour, firm.

Eastern Grain Markets.

S. S. Floyd & Co.'s telegraph of the 30th, from their Chicago house, is as follows: Wheat market active and higher, due to liberal covering of large lines of shorts, the "knowing ones" who had sold on a sure thing, thinking there was only one side to the market. Corn market continues steady and strong. Receipts of wheat at seven primary points to day, 330,000 bu; shipments, 86,600 bu. Wheat, Jan., opened, 76½¢; highest, 77½¢; lowest, 76½¢; closed, 77½¢; May, opened, 82½¢; highest, 84½¢; lowest, 82½¢; closed, 84½¢. Corn, Jan., opened, 46½¢; highest, 47¢; lowest, 46½¢; closed, 46½¢; May, opened, 50½¢; highest, 51½¢; lowest, 50½¢; closed, 51½¢. Pork, Jan., opened, \$14.80; highest, \$14.87½; lowest, \$14.40; closed, \$14.62½.

NEW YORK, Nov. 30.—Wheat, 88½¢@89¢ for cash, 87 3/8@88½¢ for Dec., 88½¢@89¢ for Jan., 89½¢ for Feb., and 93¼¢@93 3/8¢ for May.

Eastern Wool Markets.

NEW YORK, Nov. 28.—The wool market was not very active last week, and the relative positions of buyers and sellers remain unchanged. California and Territory wools remain steady. Among the sales were 10,000 lbs scoured California at 40¢@48¢; 5000 lbs medium Oregon, 25¢; 9000 lbs Territory, private terms.

BOSTON, Nov. 28.—The market was steady, with a fair volume of business. Among the sales were 35,000 lbs; Territory, 17¢@20¢; 185,000 lbs California spring and Oregon, 80,000 lbs California fall, private terms.

The London Wool Sales.

LONDON, Nov. 26.—There was a large attendance at the wool sales to-day and bidding was active, especially by foreign operators. Scoured realized recent full values, but the high limit hindered the progress of sales at the latter part of the auction.

Raisins.

NEW YORK, Nov. 28.—California raisins are without special change. Two-crown, \$1.75@1.90; 3-crown, \$2.10@2.25; London, \$2.25@2.35.

Fruits

CHICAGO, Nov. 26.—California fruits are in steady demand. The supply is moderate and offerings rather small. Receipts consist of an occasional car of grapes, which grow fewer as the cold weather advances. The following prices are received for fruit in good condition: Tokay grapes, \$3.75@7.25; Muscat grapes, \$3.50@4; winter pears, \$2.50@3; quinces, dull, 75¢@\$1.00 box.

Beans.

CHICAGO, Nov. 26.—Beans were a shade firmer. There are no home-grown beans of consequence in stock. The California crop has been drawn on until prices are higher on the Pacific coast, and this advance is also affecting foreign beans, which are quoted higher. It is said that one broker has sold 46 cars of California beans on this market so far this month. California, according to quality, \$2.15@2.25.

Hops.

CHICAGO, Nov. 26.—Choice New York hops are in rather small supply and market firm; common grades are easy. Pacific coast hops rule steady; trade moderate for choice grades, but common qualities are slow. Pacific's new crop, choice, 18¢@20¢; Pacific's new crop, medium, 16¢@18¢; Pacific's new crop, common and low grades, 12¢@15¢; Pacific's 1886, good, 10¢@12¢; Pacific's 1886, medium, 9¢@10¢; Pacific's 1885, 5¢.

Honey.

CHICAGO, Nov. 26.—California honey is in moderate demand at 7¢@8¢ for strained.

Dried Fruits.

NEW YORK, Nov. 30.—Evaporated peaches are firm, in sympathy with the Delaware product. The best quality sell at wholesale at 20¢; apricots, 16¢@18¢. A carload of Lion prunes sold at 13¼¢, a carload of other marks at 12¼¢ for 50-lb boxes and 10½¢@10¾¢ for other sizes. Two carloads of Los Nietos walnuts were quoted at 13¢.

Raisins.

NEW YORK, Nov. 30.—The Commercial Bulletin says: Our correspondence from Malaga received to-day indicates the great scarcity of really fine raisins; in fact, the information is forwarded that the supply is almost exhausted, and that hereafter only crown loose Muscatel and London will be available. The stock remaining in Malaga and the country districts is said to not exceed 100,000 boxes, while at the corresponding period last year the supply was 550,000 boxes. These reports, coming from a strictly reliable source, should certainly have a strengthening influence upon the future market.

Local Markets.

BAGS—The market for June-July delivery is firm. One vessel is en route, with another loading, with

jute for the factories in this State. Calcutta bags, June-July delivery, are quoted at 7½¢ to 7¾¢.

BARLEY—Receipts the past week were light, while the demand for shipping and consumption was large. In options on Call, trading was unusually active, with prices showing a steady gain up to today. To-day's sales are reported as follows:

Morning Session: Buyer season—100 tons, 93¼¢; 100, 93¼¢; 100, 93¼¢; 400, 94¢. Buyer 1887—100 tons, 84½¢. Seller 1887—100 tons, 83¼¢ per cbl. Afternoon Session: Buyer season—200 tons, 93¼¢; 800, 93¼¢; 200, 94¢. Buyer 1887—300 tons, 84½¢; 100, 85¢ per cbl.

BUTTER—The market continues poorly supplied, but with the present rains there is less disposition to maintain the high prices for ruling up to Monday of this week.

CHEESE—The market is barely steady. Strictly choice is in light supply, but the demand is slow.

EGGS—The market continues to rule easy and in buyers' favor for all kinds under liberal receipts from the East.

FLOUR—The market has a stronger tone, but no advance is made.

WHEAT—There is a good demand in the sample market, with holders not disposed to sell even at the advance. Ships on berth are receiving quick dispatch on Call. Trading has been more active, with a higher range of values up to Monday, when the bears hammered prices down a trifle. To-day's sales on Call are as follows:

Morning Session: Buyer season—100 tons, \$1.47; 100, \$1.47 1/8; 500, \$1.47 1/4; 900, \$1.47 1/2; 1500, \$1.47 3/4 @ cbl. Afternoon Session: Buyer season—100 tons, \$1.47 1/4; 100, \$1.47 1/4. December—100 tons, \$1.35 1/4; 100, \$1.35 1/4 per cbl.

[COMMUNICATED.]

Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 to Nov. 27, '86.	July 1 to Nov. 26, '87.
Flour, qr. sks.	2,078,145	1,464,736
Wheat, cbls.	7,446,582	4,186,258
Barley, cbls.	1,584,225	1,404,187
Oats, cbls.	99,398	113,991
Potatoes, sks.	436,916	497,246
Corn, sks.	29,758	94,617
Rye, sks.	10,578	11,382
Buckwheat, sks.	4,168	374
Beans, sks.	216,763	284,501
Bran, sks.	210,734	195,056
Hay, tons.	53,624	61,184
Salt, tons.	11,313	8,480
Wool, bls.	44,122	36,923
Hides, No.	48,732	43,373
Raisins, 20-lb boxes.	82,880	47,952
Quicksilver, flasks.	6,156	11,124
Hops, bls.	11,681	13,110

The receipts of certain articles of produce from Oregon, Washington Territory and other distant points, for the same period compare as follows:

	July 1 to Nov. 27, '86.	July 1 to Nov. 26, '87.
Flour, sks.	17,221	86,071
Wheat, cbls.	126,390	359,994
Barley, cbls.	1,198	75
Oats, cbls.	143,660	68,045
Corn, cbls.	45,726	12,590
Wool, bales.	9,052	6,986
Bran, sks.	26,418	26,382
Hops, bales.	648	106
Hides, No.	13,272	11,848
Potatoes, sks.	22,050	747

Oregon advises continue to report a free movement in wheat, with vessels under charter receiving quick dispatch. Considerable is also bought for this market. Barley is being sent from Walla Walla eastward, but Chicago exchanges report maltsters prejudiced against it.

In this city farmers' deliveries of wheat continue light, owing to their surplus being warehoused. The tonnage in port under charter are receiving quick dispatch. These heavy shipments are depleting stocks quite rapidly. The strong and higher markets in Europe and at the East cause ours to move in sympathy. There have been several parcels of No. 1 white shipping placed at from \$1.36¼ to \$1.38½, with occasional sales of strictly No. 1 favorably situated taken at a slight advance on the latter prices. Millers are taking sparingly, owing to the most of them being fairly stocked.

Barley has held strong throughout the week, even the rains on Monday did not make any impression. The strength is due to steadily lessening stocks, large consumption and freer shipping. The ship Sintram for New York took out about 1250 tons, while the vessel on the berth for England will take over 1500 tons. The latter will be Chevalier, which is in large supply this year.

Oats are strong at full prices, under moderate stocks and a good demand. Wild oats for seed are claimed to be selling at 2¢@2½¢ cts per lb. Washington Territory and Oregon advisers report that the quantity to come from there this season will be light, while none will be received from the West. Last season large supplies came overland.

Rye holds strong at full figures, under light receipts and a good inquiry.

Corn is very strong, due to the high market at the West, higher overland freights, light supplies on this coast and a good demand.

The N. Y. Produce Exchange Reporter, 20th, says: Our mail advices to-day from the West are more interesting than usual; the continued absence of rain and great injury and suffering consequent upon the duration of the drouth seem to be the all-absorbing subject. More mills have shut down this week for want of water; this for the latter part of November exceeds the drouth of 1881. The growing crop is not in a condition to go into winter, and in a large area of country the wheat plant is suffering, hence much apprehension is expressed for the future. We have had a fair demand for the Continent where prices are improving. Spain and Portugal are buying more freely. The movement of wheat at primary markets has been large and an increase in the visible this week is estimated to exceed 1,500,000 bushels.

From the late English exchanges, Nov. 12, the

following is obtained regarding wheat: In England the rainfall has been of immense value to the land in every respect, and the surface has been rendered workable for wheat sowing; probably the acreage sown to wheat may now exceed that of last year if the weather keeps open. In Germany the trade has developed some strength from the fact that a further increase in the import duties on grain is probable. According to a telegram from Berlin, dated Thursday, the German Agricultural Council is debating a motion in favor of doubling the existing customs on all cereals, and it is probable that the motion will be carried by the council, and presented to the Imperial Parliament. There is thought to be no doubt that a bill for increasing the corn duties will be laid before the Reichstag when it meets on the 24th inst., and the proceedings of the Agricultural Council are taken as indicative of the "way the wind is blowing." In France the rainfall has been welcome. Deliveries of native wheat have been on a much smaller scale, but millers successfully resist any advance in prices. Foreign wheats are in ample supply at the ports, and values, after deducting the duty, are relatively lower than they are in U.K. markets. In Paris, native wheats are now quoted at 38s 3d to 40s 5d, as on parity with English wheats in London per 480 lbs. The import duties, therefore, are proving of immense benefit to native growers in France, the difference in their favor being nearly 10s per qr. According to latest advices from South Australia and Victoria, the prospects of the wheat crop were never more favorable, the rainfall for the year having been the largest on record. In Southern Russia the maize crop is stated to be of good quality, but much of it is out of condition from the recent rainfall.

Feedstuff.

The rains of the past week appear to have acted as a stimulus to the market, for the demand is said to have increased, while the offerings are light. Choice grades continue scarce and readily command from \$18 to \$19.50 per ton, according to quality and where located. Straw finds a quick market at strong prices.

Free receipts of bran and shorts from Oregon caused an easier tone for bran and middlings, but all obtainable at concessions was quickly taken by dealers. In ground barley the movement continues large, but at unchanged prices.

Fruits.

Strawberries are coming in "stragglingly," and fetch good prices.

Both table and wine grapes are in light receipt, with dealers unable to get good keepers, except at an advance. It is said that some cold-storage table grapes are being marketed. They are in excellent condition.

The holiday demand for apples is quite free. The more choice hard keepers are freely taken for both shipping and local. It now looks as if a still higher range of values will rule before the holidays.

Mexican oranges move slow, owing to their poor quality. Only a few Californians have put in an appearance. Mexican limes are slow, as are lemons.

In dried fruits, contrary to general expectation, the demand continues good, with the stock of the better grades quite light. The market is better cleared up in this month than ever before at the like date. No doubt much of the heavy shipments to the East was due to the very large increased consumption there, and latterly to the fears of an advance in overland freights.

The stock of raisins is light, with a continued free call ruling. The East is still drawing heavily. The superior quality of this year's pack and its relative cheapness compared with the imported, promoted the increased demand. It can also be asserted that the cholera scare operated against the imported. The home demand is large, with the stock light.

Live-Stock.

This market continues to be fed with beef cattle from Arizona and many distant points. There is more stall-fed cattle offering, but butchers' views are too low to admit of free sales. Mutton sheep are moving off more freely, under a good demand, owing to freer consumption. Calves are in good demand.

Hogs are coming in freely, with packers taking all offering. In milch cows there is nothing new to report. There have been large offerings of small work horses, which caused low prices. For matched teams, drivers and general utility horses, the call is good at full prices.

The following are the wholesale rates of slaughtering to butchers:

BEEF—Extra, 7½¢@7¾¢; first grade, grass fed, 6½¢@7¢; second grade, 6¢@6½¢; third grade, 5½¢@5¾¢.

MUTTON—Ewes, 5½¢@6¢; wethers, 6¢@6½¢.

LAMB—Spring, 7¢@8¢.

VEAL—Large, 6¢@7¢; small, 6¢@8¢.

PORK—Live hogs, 4¼¢@4½¢ for heavy and medium; hard dressed, 6¼¢@7¼¢ per lb; light, 4¢@4½¢; dressed, 6¢@7¼¢; soft hogs, live, 3½¢@4¢. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

Cold weather destroyed all vine vegetables.

In cabbages, the Eastern demand, heretofore noted, is continued with choice hard heads, taken at good prices.

Choice potatoes have a stronger, healthier tone, owing to a good local and shipping demand. The bulk of the stock here is poor, only fit for feeding to stock, which causes choice to be well cleaned up each day.

Onions are stronger and higher, with a good demand reported for both home and shipping.

Pumpkins and marrowfat squash are in good demand.

Miscellaneous.

Rains the past week have caused an improving demand for grass seeds.

Game has ruled largely in buyers' favor throughout this week.

In poultry, there is a stronger tone at the close, owing to light receipts and a good demand.

Salt has been advanced from \$1 to \$2 per ton.

Beans are still moving up. The advance is due to light stocks, light supplies and a continued free demand.

In hops, there is little or nothing to note. Some large growers are consigning to the East.

Wools have ruled more quiet the past week. As usual, the close of the year is always dull, with prices in buyers' favor.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	308,481	195,808
In port, disengaged.....	87,389	85,437
In port, engaged.....	26,582	72,738

Totals..... 422,452 343,983

To obtain the carrying capacity add 60 per cent to the registered tonnage.

San Francisco, Nov. 30, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

Opening the Way to Portland.

The completion of the railway from various California points to Portland, Oregon, is now only a matter of a few days. Various efforts are in progress to secure proper celebration of the linking of the two great commonwealths of the Pacific by continuous rails. At the meeting of the State Board of Trade in this city on Tuesday of this week the following proceedings were had:

The committee on the celebration of the opening of the California & Oregon railroad met in the rooms of the State Board of Trade at 7:30 o'clock. Mayor Pond occupied the chair.

A communication was read by the secretary, from Thomas J. Haynes, Secretary of the Chamber of Commerce, stating that the president, William L. Merry, had appointed the following committees: Committee on Portland Celebration—R. S. Sneath, L. L. Baker, C. L. Taylor, W. W. Dodge and Fred A. Gibbs; Committee on Sacramento Celebration—A. C. Hecht, W. B. Harrington, L. A. Haber, W. T. J. Schenck and James R. Kelly.

A dispatch was received from John Gates, Mayor of Portland, to Mayor Pond, which read as follows:

Portland will join San Francisco and other California cities in celebrating the completion of direct railroad connections, and will heartily welcome all who may visit us on that occasion.

W. H. Miller, for the Committee on Transportation, reported that it had engaged three cars for the accommodation of San Francisco delegates and their friends. Cars containing the delegations from other cities would make up the train to Portland, which would have dining-rooms cars attached. It was proposed to have the cars gaily decorated. The time of starting from San Francisco is Monday, December 12th, at 4 o'clock.

The following resolutions, presented by W. L. Merry, were unanimously adopted:

Resolved, That a special committee of five be appointed from the members of this committee, who shall have full and complete charge of an excursion to Portland, in celebration of the completion of railroad communication between the city of San Francisco and the city of Portland and between the States of California and Oregon, comprising the following:

Four delegates representing the State of California, to be chosen by the Governor of the State.

Four delegates representing the city of San Francisco, to be chosen by his Honor the Mayor.

Four delegates from the Chamber of Commerce of San Francisco.

Four delegates from the Board of Trade of San Francisco.

Four delegates from the Manufacturers' Association.

Four delegates from the Produce Exchange of San Francisco.

Four delegates from the Executive Board of the State Board of Trade.

Four delegates from the Southern Pacific Co. and one delegate from each local Board of Trade of the cities or counties of the State of California. The latter delegates to be selected as the organizations herein mentioned shall direct.

The following committee were appointed by the Chair to carry out the resolutions: William L. Merry, W. T. Garratt, A. T. Hatch, Frank P. Dalton and George H. Sanderson. By a unanimous vote the Chairman, Mayor Pond, was added to the committee.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING NOVEMBER 22, 1887.

373,715.—COMBINED SCALE MEASURE AND SPIRIT-LEVEL—Thomas H. Bates, Pasadena, Cal.

373,651.—CONFORMATOR FOR THUMBS—John H. Fones, Oakland, Cal.

373,524.—MOWING MACHINE—Charles A. Greene, Stockton, Cal.

373,702.—OAR-LOCK—Charles H. Vite, S. F., Cal.

373,761.—ELECTRIC-ARC LAMP—Gustav A. Wiese, S. F.

373,710.—INJECTOR FEED-COCK—Gregg W. Wiswell, S. F.

17,888.—DESIGN FOR VIOLIN—David K. Darbyshire, S. F.

373,489.—PLOW—John T. Senteny, Blocksburg, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

H. STUCKE—Arizona Ter.
C. E. WILLIAMS—Yuba Co.

SAN FRANCISCO GRAPES.—The *Alta* has lately received from Mr. David Paine of this city a bunch of purple grapes, grown at his residence, No. 129 Dolores street. The berries were the size of the ordinary Hamburg, delicious to the taste, and the cluster weighed fully a pound.

"WITH BUBBLING GROAN!"

A Fatal Sense of Security Awfully Realized at Sea.

'A wet sheet and a flowing sea, a breeze that follows, fast.'

From his look-out the faithful old captain of yonder merchantman casts an uneasy glance at the distant horizon. See! yonder a small speck of cloud "no larger than a man's hand." He watches it with his piercing eye for a few moments, then reaches for his long eye-glass. To his experienced view this harmless little cloud betokens danger.

Across his bronzed face there comes a look of determination, and, with quick orders to the seamen, the craft is put about and all sail made for the nearest harbor, where in apparent safety the anchor is dropped, and the hardy mariners watch the approaching storm with defiance.

The storm bursts!

The decks have been cleared, the sails close furled, and all ordinary preparations made for an emergency.

The storm increases; but all seems safe.

But see! the vessel gives a sudden lurch, turns quickly about, and away she goes!

The anchor chain has broken!

This mighty ship might have ridden safely but for one weak link in that anchor chain!

The strength of the chain is no greater than the strength of its weakest link.

On the sea of life how many men are wrecked because of the unsuspected weakness of a link in the chain of health—one weak vital organ in the body.

The mystery of death is even greater than the mystery of life. We think the links of our chain are strong, but we too seldom critically examine them for ourselves and never really know that they will bear the strain that we put upon them.

"I have a friend," said Dr. Dio Lewis, "who can lift 900 pounds, and yet is an habitual sufferer from kidney and liver trouble and low spirits." The doctor, who was one of the wisest and safest public teachers of the laws of health, wrote:

"The very marked testimonials from college professors, respectable physicians, and other gentlemen of intelligence and character, to the value of Warner's safe cure have greatly surprised me. Many of these gentlemen I know, and reading their testimony I was impelled to purchase some bottles of Warner's safe cure and analyze it. Besides, I took some, swallowing three times the prescribed quantity. I am satisfied that the medicine is not injurious, and will frankly add that if I found myself the victim of a serious kidney trouble I should use this preparation."

One year ago the *Servia*, while in a great storm, parted her two-inch rudder chain—no wonder—it was rusted through. The key to human health is the condition of the kidneys, and they may long be diseased and we be ignorant of the fact, because they give forth little or no pain. They in reality cause the majority of all the deaths, by polluting the blood and sending disease all through the system.

SILK CULTURE AT PIEDMONT.—A meeting of the Woman's Silk Culture Association was held recently to furnish a plan of work to be carried on at the Piedmont Silk Station. In the search for water a depth of 40 feet has been reached, and it was decided to sink 35 feet further. It was decided to extend the facilities devoted to cocoon-raising; to make the farm self-sustaining; to cultivate the several varieties of worms and trees, to see which are best suited for this country; to build a larger cocoonery; to distribute the surplus of trees at the ranch and to form a typical orchard. The following ladies and gentlemen were present: Dr. Gibbons, president; Mrs. L. E. Pratt, secretary; ex-Governor Perkins, Prof. Hilgard, Mrs. T. H. Hittell and Mrs. Ashburner.

The Culture of Farm Crops—A Handbook of Practice for American Farmers. This book should be in every farmer's house and in every student's library; for the farmer it is a library in itself and for the student a most valuable book for reference. Mailed on receipt of \$1.50. Address, Duane H. Nash, Publisher, Millington, New Jersey.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Consumption Surely Cured.

To the Editor:—Please inform your readers that I have a positive remedy for the above named disease. By its timely use, thousands of hopeless cases have been permanently cured. I shall be glad to send two bottles of my remedy free to any of your readers who have consumption, if they will send me their Express and P. O. address. Respectfully,
T. A. SLOCUM, M. C., 181 Pearl St., New York.

HALL'S SARSAPARILLA

Cures all Diseases originating from a disordered state of the BLOOD or LIVER. Rheumatism, Neuralgia, Boils, Blotches, Pimples, Scrofula, Tumors, Salt Rheum and Mercurial Pains readily yield to its purifying properties. It leaves the Blood pure, the Liver and Kidneys healthy and the Complexion bright and clear.

Anarchism in America.

The S. F. *Alta* has a very timely sermon on "Lingg, the typical anarchist," and the class he represents: He was scarcely more than a boy, but he was a typical anarchist. With but little experience in the world, and with less knowledge about economic matters, he came to this country in 1885 to raise the red standard of social and political revolution. A lad of violent temper, with no homely common sense, strong physically, and a believer in force, he required the hospitality of this land, which had offered him an asylum, by libeling its institutions and murdering the officers who, by enforcing its laws, protected his life and liberty. He led others by his violence. There is a class always ready to follow professions of courage, and vociferous denunciation always secures recruits. So Lingg's voice was for blood. On the open space on the lake-front in Chicago, corresponding to our sand-lots, he harangued Sunday after Sunday against law, against God, against society, against all things that are.

He was a skilled worker in metals, and had readily secured employment at good wages, but he loved the applause that followed his violent speeches, and soon abandoned himself entirely to the task of destroying the country of which he was not a citizen, murdering the people who had welcomed him as an alien, and overthrowing the laws which divided with him the birth-right of liberty which belonged to those he had marked for assassination.

Coming here in 1885, had he been obedient to the mild laws of the country, had he been industrious and frugal, had he wrought well at his trade, with none but himself to support, by frugality he might now have been far upon the road to ownership of a home and to independence. But he preferred to cut across lots, and it led him to the gallows, which he has cheated by self-slaughter.

Let those who regard him as a hero, and propose to follow in his footsteps, beware. While they are boisterous the law is silent, long-suffering and full of patience; but once they commit the overt act, the land whose tolerance they have insulted, and whose hospitality they have betrayed, will smite them from existence.

A very serious series of questions is raised by the incident which Lingg ended with a double tragedy. Processions have been paraded in our large cities in honor of these men who libeled our government and murdered our people. In the processions, 99 per cent of the men are not of American birth. They are aliens. A majority have not even taken upon them American citizenship. They are here as critics of our country, as avowed enemies of our laws, which they did not make and which they refuse to obey. They propose no system of government to replace this which they intend to destroy. Their tendencies are destructive, and not constructive. They come here and crowd our own people, and foreigners who are quiet and well-intentioned toward our institutions, out of mills, mines and workshops. They occupy the field of skilled and unskilled labor, not to develop it, not to harmoniously advance the country, but to paralyze its industries, disorder its commerce, disturb its peace and destroy its institutions.

Our country suits our own people, those who are of the lineage of the men who made it and fought to maintain it. It suits all well-ordered foreigners who come here to take advantage of the best opportunities that men have had since the race was created, and if it doesn't suit these disturbers and murderers they would better form a procession and march out of it, for the black cap and noose will go from head to head, and neck to neck, as long as one of them raises his hand to overtly carry out the principles in behalf of which he raises his voice. They can refuse with insult the final attentions of the clergy, but they cannot escape those of the hangman.

The eight men who were convicted in Chicago, and of whom five are now dead, might by industry and thrift have been good, property-owning citizens. Within two years we have known foreign-born men in California to homestead government land, which they are now tilling, and which, by the time their title is perfect, will be worth \$5000 to \$8000 for each holding. The government gives them the land, and their labor upon it assures them a living, and by and by a fortune. The same government offered by its laws the same gift to Lingg and the rest, and they required the proffered kindness by treason and murder.

There was no faltering with them. The law they so long defied took their lives, and it will overtake their sympathizers who attempt to imitate them. The fact that is put foremost by the incident and its collateral is that we have been receiving an immigration with which we do not assimilate. That is as bad for a nation as for a man to eat more food than he digests. As the country gets older and its population more dense, its digestive faculty grows weaker and it finds it all the time harder to assimilate anarchists, socialists, communists and the other abnormal food sent to it from Europe. It is time to discriminate, time to cease eating more immigration than we digest, time to redeem our commerce and industries from the control of the enemies of our institutions. Therefore let greater kindness go into our invitation to the orderly foreigner, who will appreciate the asylum offered by our laws; but let it be known that we have not even standing-room for our imported enemies.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE!

FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOEBIG—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

DR. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully, E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 5 pounds each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobrauto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

NITROGENOUS SUPERPHOSPHATES

— OF THE —

MEXICAN PHOSPHATE & SULPHUR CO.,

The Best Fertilizer in the World!

IN USE IN ALL PARTS OF THE OLD WORLD AND ACKNOWLEDGED TO BE
THE BEST KNOWN.

We have been shipping this material for years to our Agents, Messrs. SCHRODER & MICHAELSON, HAMBURG, and under date of January 4, 1887, they wrote:

"The demand for your phosphates continues very good, as you will see from our having sold so far ahead as September and October arrival, at full prices, and we could to-day place a much larger quantity if we only had them to offer."

Under date of January 26, 1887, Messrs. SCHRODER & MICHAELSON, alluding to letters acknowledged, write as follows to H. M. NEWHALL & CO.:

"They referred partly to the quantity of Mexican Guano which we may expect to receive in the course of the present year, in regard to which our repeated inquiries addressed to the Company had so far brought no reply. We are glad to note from your telegram that Mr. Halsey has now written us on the subject, but we are, on the other hand, somewhat disappointed at the SMALLNESS of the figure you name (8000 to 10,000 tons) which we hope is exclusive of the 'Tranmere' and 'Saigon' cargoes. We have, in fact, in consequence of the numerous inquiries for this guano, been placed in an awkward position, through not being able to give any reliable information to our buyers in regard to the quantity of Mexican Guano forthcoming during the present year."

Its Introduction into California has been marked with the most gratifying results.

IT IS THE CHEAPEST, BECAUSE THE MOST EFFICACIOUS! THE SAFEST, BECAUSE DIVESTED OF ALL ORGANIC MATTER!
AND IS TOTALLY INOFFENSIVE TO TOUCH OR SMELL!

We invite correspondence with Farmers, Viticulturists and others interested, and are prepared to give the minutest details in regard to this most valuable Fertilizer. For particulars of Analysis see certificate of Dr. Schneider and testimonial of Professor Hilgard in another column.

MEXICAN PHOSPHATE & SULPHUR CO.,

SAFE DEPOSIT BUILDING, Room 7.

American Senna.

If our readers have not developed a hatred of the whole senna family through memory of the liberal potations of "senna tea" which was one of the mainstays in the old system of household medication, we beg a few moments' attention to the subject of American senna which is described by Dr. Vasey, Government Botanist, in one of his recent reports. The engraving is reproduced from this source, the main figure showing a branch in bloom, natural size, Fig. 1 being an enlarged flower, and Fig. 2 representing the mature pods, which, even to the popular mind, shows that the plant belongs to the large order *leguminosae*. The botanical genus of senna is *cassia*, which includes about 400 species, mostly herbaceous, but some shrubs and trees. The commercial senna consists of the leaves of two or three species which grow in Egypt, India and Arabia.

In the United States we have about 20 herbaceous species, only one of which, *Cassia marilandica*, has obtained reputation for medicinal use. This is a vigorous plant, having a perennial root, the stalks, many from the same root, growing four or five feet high, with numerous alternate large pinnate leaves, six or eight inches long, and composed of about eight pairs of oblong-lanceolate leaflets of a light-green color, which are about one inch to one and a fourth inches in length, smooth, tipped with a very short, bristle-like point. Near the base of the leaf-stock is a small dark-colored stalked gland of unknown use. The flowers grow at and near the top of the stem in short racemes from the axils of the upper leaves and are each about one-half inch long. The sepals are five, oblong, thin, shorter than the petals; the petals are five, bright yellow, half an inch long, rather curved, obtuse, and broadest near the top. There are ten stamens, which are unequal in length, and some of them imperfect, the anthers opening by two pores at the apex. The young germ or pod is quite hairy, but becomes in age a smooth, linear, curved pod, four to six inches long, and containing 20 or more seeds, a depression of the pod occurring between each of the seeds.

Our plant is related to the Eastern senna in its botanical habit and resembles it in its medicinal virtues, but requires about one-third greater quantity to produce the same effect. The Eastern senna is so cheap that there is little inducement for the gathering or use of our native one.

PORK-PACKING IN OAKLAND.—A meeting of the trustees of the lately incorporated Chicago Packing and Provision Co. was held Dec. 6th, and the following officers were elected to serve one year: W. Selover, Pres.; J. S. Emery, V. P.; A. Gerberding, Sec.; P. N. Schlesinger, Supt.; First National Bank of Oakland, Treas. Plans for a large packing-house have been received from Chicago, and work on the new structure will be commenced at once in Oakland. It is expected that the building will be ready for business within 90 days.

A CHANCE FOR INVENTORS.—R. W. Cameron of New York City has received a communication from the Government of New South Wales, offering a reward of \$125,000 to the inventor of any process that will exterminate the rabbits which overrun Australia and New Zealand.

POSTAL TELEGRAPHY commends itself to Congressman Vandever's approval. A dispatch from Washington says he expresses the opinion that if Congress is to act in the matter, a bill

CITRUS FAIR AT SAN JOSE.—The Santa Clara County Horticultural Society will hold a two weeks' citrus fair at San Jose, beginning Feb. 22, 1888. All the counties of Northern and

Renewing an Old Orchard.

A subscriber in San Rafael asks us how to proceed to renew "an old orchard which has for 12 years lain unplowed and unplowed and is infested with three or four kinds of insect pests." It is hard to tell what to do with such a case without seeing it. If it is in as bad shape as some old neglected orchards we have seen, the cheapest and best way to renew would be to cut down the trees, grub out the roots and burn every vestige of the old growth which could be collected. Then break up the land deeply, following in the furrow with a sub-soiler, cross-plow in the spring, and leave the land fallow during the summer—plowing under the weeds as long as there was moisture enough near the surface to start weeds. Another good plan would be to put in potatoes, corn or some other crop which would need cultivation during the summer. In this way the land can be brought into good condition for replanting next winter. This is the heroic way of renewing an orchard, and in many cases it is the best way. Whether this would be the wisest thing to do in the case of our correspondent one could only tell by seeing the trees.

Supposing the trees are of good varieties, not so badly gnarled and stunted and diseased and brushy as to make their renewal unprofitable, the first thing to do is to employ a skillful pruner, one who is not merely a wood-chopper, but really has some eye for a tree, and start him in at once. If he is a good hand he will know enough to take out all dead or dying wood, to head back or remove other branches as needed, to re-form the tree, to cut so as to develop branches where they are needed, etc. All large cuts should be pared smooth, and covered with paint or shellac, or a liquid grafting preparation. All brush should be carefully collected and burned, and when this is done, the trees should be well sprayed with one of the washes recommended by the State Board of Horticulture, as printed in another column of this issue. When this work is thoroughly done, put on all the well-rotted manure that can be found in the neighborhood, and plow as deeply as any plow will go. Plow again before the weeds become too high to turn under, if the land does not become too wet for plowing. If so, as may happen in a region of heavy rainfall like San Rafael, the weeds must be mown and then the land plowed as soon as it comes into proper condition. After the rains cease, and the last spring plowing is done, use the cultivator and keep the surface mellow during the summer.

If the varieties are not good, new sorts may be grafted in this spring or budded into the new shoots next summer. The after treatment will be constant attention to plowing, spraying and cultivation. If any one can advise any better or easier treatment for an old orchard we should like to hear from them.

A CHECK ON HORSE-THIEVES.—A correspondent of the Tulare Register, who has suffered at the hands of horse-thieves, suggests the enactment of a law requiring from every person who desires to sell a horse a permit under the sheriff's seal, the blank to be filled out by resident officers. These blanks should contain a description of the horse and the name of the party, and when a horse was offered for sale the intending purchaser might ask to see the permit.

AMERICAN SENNA—*Cassia Marilandica*.

should be introduced in both houses at an early day, else when the session gets advanced it will be next to impossible to secure any result, as other important matters will absorb all the attention of Congress. The people on the Pacific Coast, more than any others, feel the need of postal telegraphy.

THE CALIFORNIA FRUIT-GROWER, a much-needed book, as noted on another page, is to be published by the firm of Dewey & Co. at as early a date as possible. Address orders to this office.

Central California will be asked to make displays. The American Horticultural Society will also be invited to attend in a body, and excursions will be arranged from Los Angeles and Riverside.

BIG TOMATOES IN OREGON.—W. H. Maule, the Philadelphia seedsman, offered a prize of \$100 for the largest tomato raised this year from seed sold by him. A Wallowa paper says that the largest reported were from Indiana and Eagle valley, Union county, Or., and weighed 3½ pounds.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Napa County Notes.

EDITORS PRESS:—Of repeated promises of rain during the last month or more have proved false, and anticipations and longings of our farmers have come to naught. While other sections of the State have been visited with showers, we look forward with hope for the first of the season, which, maybe, will come before this letter appears in the RURAL. [It has.—EDS. PRESS.] Harvest over, the fall work done, the vintage concluded, many farmers have commenced seeding for next season's crop, and at this date considerable hay land has been cultivated and sown generally to black oats, the little summer-fallow we have in this valley to wheat and considerable dry plowing is being done for different varieties of grain. Ground devoted to corn this last summer was seeded some time ago.

Black oats, for hay, are in large demand, and find increasing favor with our farmers from year to year. What seed is raised in this valley is usually engaged—sold—early in the season. Our barley crop will, as in past years, be, as compared with the wheat crop, small. Bald barley is raised to some extent, but generally for hay rather than for thrashing.

More summer-fallowing is done in Berryessa valley than in any other portion of the county. There the farms are large, the soil productive. These summer-fallowed fields have been already sown to wheat, that they may get the benefit of all the rains. This valley, the second largest in this county, is beautifully situated, possesses unexcelled climate and has a grand future. It cannot be long before a railroad will traverse the valley, when we may look for a division of the large farms, an increase of population and a rapid appreciation of real estate.

But, as frequently noted in the past regarding the agricultural progress of our county, but more especially of Napa valley, grain-raising is giving way to the cultivation of fruit; the upper valley was long since almost entirely devoted to grape culture; in the lower portion orchards are increasing in number. Our local nurseryman, L. Coates, reports the demand for trees this fall much larger than in previous years, not only here, but in all portions of the State, prune trees being especially in request. Our finely equipped cannery, located in Napa City, the railroad running by its front doors, the river flowing past its rear—now closed, awaits the coming of some good manager who can easily do a very remunerative business the coming season. The fruit of our orchards is eagerly sought by cannerymen of localities far and near, and many of our orchardists made much money this season.

The excellent showing our county made at the last Mechanics' Fair in San Francisco, and the handsome awards received, served a two-fold purpose. Not only did it call the attention of the general public hitherward, giving us a notoriety we richly deserve, but it served as a stimulus to our farmers and fruit-growers, who, next year, will endeavor to make a far better showing and capture the first prize. We mean business and therefore that our award will head the list is a foregone conclusion. I think many of our own residents were astonished when the first award for nuts in variety was given this county at the exposition named. Although we raise so many fruits, vegetables, grains, nuts, etc., we are just beginning to realize the marvelous productiveness of our soil and its adaptability for a very varied husbandry.

Olive culture is receiving considerable attention, and not only are many trees being planted, but large orders for trees are being received from all portions of the State. Mr. A. Flamant is the leading local spirit in this branch of horticulture, and others are catching something of and will profit by his enthusiasm.

What the citizens of this county most desire now, particularly those residing in Napa valley, is the location of the National Veterans' Home at Yountville. Until the committee who visited the Home a few days ago, and who are now visiting the southern part of the State, there inspecting sites offered by different communities, shall have announced their choice, we shall be in hopes ours will be the favorite locality. The distinguished committee, upon their visit of inspection, were, apparently, favorably impressed.

To better advance the interests of our county, Boards of Trade have lately been organized in Napa, St. Helena and Yountville, and the advantages our county offers to persons intending to locate in the State will be more widely and systematically made known, and, at the same time, concerted action will be taken upon internal improvements. Our real estate dealers make many sales; the inquiry for land is growing. Noteworthy improvements are being made in the country districts, and in the towns there is great activity. In Napa City mechanics are with difficulty obtained, and that speaks well for our prosperity. One contracting firm has had from 20 to 26 men at work for them during the entire summer.

It will not be long before our entire State, like those in the distant East, will be gridironed with railroads. In this county, the road now building from Napa City to Lake county will be

a long-desired and a very beneficial improvement which we hope will be completed in the near future. These things seem to indicate the construction of a railroad from Napa City to Point Tiburon or vicinity, along the north side of the bay, thus bringing us into much quicker communication with the metropolis.

For many years there has been no Grange in the lower Napa valley. A decade or so ago one was organized and for a time flourished in Napa City, but it was short lived. Now the farmers here have no organization of the kind. The grape-growers' and horticulturists' semi-monthly meetings have been of great benefit in the past. Progression is the order of the day, and all along the line there are evidences of greater prosperity in the future than in the past.

R.
Napa, Nov. 28, 1887.

San Joaquin West-Side Notes.

EDITORS PRESS:—Winter work is going on briskly in this neighborhood. Notwithstanding we had a total failure the past season, not even raising hay, not an acre of land, goes begging for a renter.

The past dry year was taken more cheerfully than any I have previously known. Not a word of complaint or regret have I heard, from which I infer the settlers are better situated to endure the loss of a crop than formerly.

Indeed, there are many evidences that farmers here are gaining in financial stability, and we seldom hear the expression, so frequent in years past: "I shall sell out and move away the next good crop." We are learning slowly the best implements and machinery to use, and the most profitable grains to sow, thereby making the cost less and production greater. We are learning also to better appreciate the advantages of this locality, and are coming to the conclusion that for a poor man with small capital to make a living with reasonable hopes of competence in the end, this portion of the State will compare favorably with other much-bepuffed places.

The fact that so many who once farm on the west side find their way back after trying other places is an evidence in its favor. They often find a climate that disagrees with them, or find that with harder work they make no better living. Nearly all land is sold to old residents, who prove their faith in its future by buying all that is for sale.

Without any boom (may one never come this way) land has steadily risen in value, having nearly doubled the past five years. Several farms changed hands the past year at \$25 per acre, but holders are not anxious to sell.

Tracy continues to grow. The past year has witnessed the most gratifying improvement since the location of the town—the erection of two churches—a Catholic and a Presbyterian, the latter costing about \$2400 and having a large, sweet-toned bell, the gift of an Eastern friend. Both town and country are improving in windmills, fences and buildings; but the fact that so many are living on rented land is a great drawback to real improvement. We are hoping the new railroad that crosses the others at Tracy will do much to build up this locality. Indeed, we hear hints of many things—water-storage, irrigation enterprises, etc.—and wait patiently to see what the future has in store for us.

At present, land is certainly very cheap, considering locality, richness of soil and fine climate. Indeed I look for the time when well-appointed sanitariums will be built here, where those who find their neuralgia, rheumatism and bronchitis aggravated by the fogs of the coast can flee for temporary relief, to bask in the bright sunlight and dry atmosphere. True, it is rather warm for comfort in midsummer, and too much wind in the spring, but a great portion of the year the climate is almost perfection.

We hear prophecies of both good and evil for the season. Some are saying plenty of rain; tule rats are building their nests high. Others are shaking their heads at the early cold weather, ice having formed several nights lately. If the old moon sign—dry year when the moon is well on its back, so you can hang a powder-horn on it—holds good, we have had two very good moons lately, well on end. I never had faith in lunar signs, but have noticed this to have been true the past two years. Another dry year now would indeed be serious. The more so to ourselves, as we lost our barn, containing grain for seed and feed, last spring. However, there is plenty of time for all needed rain yet, and we will go forward with hope.

Mrs. J. M. K.

Tracy, San Joaquin Co.

Labor and Liquor.

EDITORS PRESS:—I notice that our fraternal labor organizations are having trouble with the liquor traffic. Just what might be expected! Whisky never was a peace-maker, and in this "unpleasantness" my sympathies are with the labor interests, for I regard labor as generally promotive of prosperity, excepting, of course, labor invested in liquor. That I consider an investment in general loss. Labor is the foundation of wealth. Nearly all assessable values are the products of labor. All values in improved lands above that of their wild condition, all agricultural products, all buildings,

all manufactured goods, wares and implements, all commerce and literature, are labor's productions. Money, the representative and measure of values, is one of labor's productions, yet labor may be misdirected and turned to loss. For illustration, let us suppose two cases and compare results. Suppose a carpenter employed to build a house receives \$500 for his work. That \$500 is so much added to his assessable valuation. His employer received as equivalent for the money he paid a house assessable at \$500 or more. The county assessor finds the same amount of money to assess as before, and a \$500 house besides that had not existed before. The county is that much richer and nobody poorer by the transaction. That \$500 invested in labor has duplicated its value. Thus well-directed labor creates wealth.

Now suppose another carpenter turns saloon-keeper. (All saloon-keepers have left better employment.) His neighbors pay him \$500 for liquor. Do they get an equivalent? They pay for the liquor and drink it, and with the drinking all semblance of value vanishes forever.

No duplicated value there to assess, but in its stead the common results—demoralization, idleness, crime, and consequent expenses. The drinkers have bought an injury and laid up a loss; a loss to themselves and a loss to the commonwealth. The labor that made the drink and that of him who sold it was loss-producing work. By transforming industrious, wealth-producing laborers into idlers, tramps and criminals, it lessens the labor product of the country; thereby undermining the very foundation of wealth. Yet we are told of the good the traffic does in furnishing "employment" to laborers. As if employment could never be otherwise and useful, or industry ever fail to be a virtue. I believe Satan has a reputation for industry, but not much for good works; and I know of no "employment" that seems to me more thoroughly devilish in general characteristics and results than the liquor traffic.

THOUGHTOGRAPH.

Nov. 18, 1887.

Santa Barbara Notes.

EDITORS PRESS:—In resuming my notes taken during a recent tour of some of the counties of the southern portion of the State, I have first to say, that, for more than two months, from effects of bad health and consequent suffering, I have been incapacitated for the business of correspondent. As my health seems to be gaining ground again, I resume my correspondence with a hope of being able to at least briefly give you some items of interests from observations.

During our stay in the county of Santa Barbara, we found all astir, in both town and country, and flushed, because of the successful building of the coast extension of the S. P. R. R. The completion of the road to the city of Santa Barbara dates a new era in the history of that celebrated watering-place. It has long been a resort for tourists and health-seekers. All are charmed with its delightfully mild days and pleasantly cool nights. The Santa Barbarans prides himself upon the well-recognized climatic condition of the place. Other places may believe they may have the best climate in the world, the Santa Barbarans know they have.

Now that the glorious climate of these western shores is attracting attention abroad, and so many of the first-class families east of the great Rockies are pouring into various parts of California a new population, many of whom are capitalists, it is confidently predicted that Santa Barbara will be one of the counties to be particularly favored by a flood of immigration, which may further enhance the value of lands, already high in public repute, and bring renewed life and activity into all channels of business.

Carpinteria Valley.

On our way from San Buenaventura by way of the beach road, alongside the railroad, after rounding Rincon point, we enter the Carpinteria valley lying along the coast, east of Santa Barbara, the same being a section of the coast valley extending from Rincon point westwardly to Gaviota pass. This valley is rather level about the town of Carpinteria, but in the main quite undulating, finally rising toward the north and terminating at the foothills of the rugged Santa Inez range of mountains.

The most of the Carpinteria country is well watered, and the soil is principally formed by alluvial deposits. The cultivation of beans is the most extensive business here, and that of corn is also considered a matter of importance. Potatoes of good quality are raised. Grain in many places is grown to fine advantage.

We notice that so far as observation extends but comparatively few persons pay much attention to stock-raising, but what we see shows very favorable conditions for the rearing of fine horses and cattle. We will mention that Mr. Thos. P. Callie, three miles west of Carpinteria, is interesting himself in the rearing of Jersey cattle. His Jersey bull, Romeo, calved Jan. 1, 1886, registered in the Pacific Coast Cattle Club, No. 394, was bred by C. K. Lawton of Santa Barbara, bought by Mr. C. at six months old, is of good size, color, a beautiful dun, the shade becoming lighter on the back, legs, and muzzle.

Higgins' Ranch.

Among the many valuable places in this valley we will mention that of P. C. Higgins, less

than a mile below town. This is a most delightful residence and farm. The principal crop is lima beans. It is uniformly good, the production being about three-quarters of a ton per acre on all his grounds. There are exceptions in favor of higher figures, as much as 2500 pounds per acre, but the first named quantity is the ordinary average yield.

The young orchard at this place looks very well. Success with the soft-shelled European walnut is quite encouraging. Nectarines do not succeed every year.

Rincon Canyon.

At the extreme eastern end of the valley the surface is considerably elevated, and thence we descend into the wooded canyon of Rincon creek. Up and down the rather narrow confines of the "canyon," we find very rich alluvial soil, very productive of strawberries and other fruits thus far tried. Among the few places here we will mention that of J. E. Shepard, five miles northeast of Carpinteria. He has 140 seedling orange trees 11 years old and in fine bearing condition. He has two acres strawberries, varieties being Monarch of the West and Charles Downing. He considers the first-named best for market, as it bears transportation well. The last-named pronounced best for home use. On the rich fields near Carpinteria we see much that is interesting in the way of tree and plant growth. H. C. Ford, artist of Santa Barbara, has a country residence here on the main coast road, and has adorned the grounds by the introduction of many of the most ornamental plants, shrubs and trees, most of which are exotic, many of which are quite rare and must have been procured at both trouble and expense. It would seem from the success attending this, and we may say somewhat similar experiments about Santa Barbara, that we might have to search the world over to find a more favored spot for a wide range for the growth of vegetation, if the natural locality of the same is within the temperate or semi-tropical zones.

McD.

POULTRY YARD.

Practical Hints for December.

Do not neglect the water fountains. Keep them sweet and clean and filled with fresh water. During the rainy season, keep the yards well drained, so that no impure water will stand where the fowls may drink it.

If eggs are the main desideratum in keeping fowls, avoid short-legged fowls of any breed. They rarely lay well the second year on account of laying on too much fat, while a fowl with good length of leg will ordinarily lay well until three years of age.

Keep only as many fowls as your time will permit you to attend to well in every particular. When 50 fowls well cared for will pay a good profit, 100 somewhat neglected may be kept at a loss. Feed judiciously, keep the water fountains pure, look out for vermin, avoid overcrowding, give the fowls a chance to scratch, provide shade in summer and a dry shelter in winter. Think of these things once a month.

Give the September hatched chicks a bed of straw, but do not allow too many to huddle together.

Collect the eggs often, and wash all dirty eggs at once, that they may look well when sent to market or sold for hatching.

As a rule, short-legged fowls will fatten more rapidly than those "well up on their pins." This is important to the broiler-raiser, as his object is to get a nice plump chick as soon as possible.

This is generally a month of abundant rain on the Pacific Coast. See that the poultry-yards are well drained, and that all depressions where muddy, filthy water may collect are filled up.

A good supply of dry earth and fine gravel will be found a great convenience during the winter months. The gravel supply should not be neglected until the creeks are running full of water, and it is impossible to get it.

A damp roosting-place is an abomination, and yet fowls prefer a wet roost free from lice to a dry one covered with vermin which sap their blood and strength. This will explain why some people's chickens prefer to roost in trees.

The straw-stack may be put to a variety of good uses in December. It means bedding for the cows and horses, dry floors for the poultry-houses and for hiding grain in for the fowls to scratch after, bedding for the pets, and feed for all kinds of stock in a greater or less degree.—*The California Cackler.*

Gas Lime for Poultry Vermin.

EDITORS PRESS:—When I moved to Morro bay last winter, the fleas were an awful pest; they appear to propagate in that sand. I remembered that gas laid me to sleep once for several hours, and I concluded to experiment on the fleas. I got some gas lime at San Luis and sprinkled around the yard, chicken-house, stable and barn, with the happiest results. While it has checked the flea nuisance, it appears to have laid the chicken lice also to rest. I only sprinkled the bottom of the chicken-house, and it didn't affect the chickens at all.

True, it must not be sprinkled thicker than an inch or so. If the lairs are not too close, it will not hurt the chickens.

The gas treatment for scale insects, I believe to be the very thing for fleas and chicken lice wherever practicable.

CHRISTIAN E. SCHNEIDER.

Ballard, Cal.

HORTICULTURE.

Fruit in Southern California.

The following is the report of Commissioner A. S. Chapman to the State Board of Horticulture, for an early copy of which we are indebted to Secretary Lelong:

The past season in this part of the State has been a very prosperous one. Owing to the wonderful rise in real estate, many fine orchards have been abandoned, to be replaced with beautiful homes, and many new orchards have been set out.

Insect Pests.

Black Scale.—The black scale infesting the citrus and olive trees has this year ceased to be a pest, owing to its parasitic fly which has kept it in subjection.

Red Scale.—The red scale infesting the orange trees is very bad. Mr. D. W. Coquillett, however, has found scales with internal parasites, therefore we may look to nature for relief, we hope. The larvæ of the twice-stabbed ladybug does not increase as fast as we might expect, yet there are spots in our own orchard where the red scale is scarce where before it was plentiful.

Fluted Scale.—This scale has been steadily increasing, notwithstanding all efforts to keep it in subjection. While Mr. Klee, State Inspector of Fruit Pests, was here a short time since, we found a larva feeding on the egg in the sac of a female. I have since succeeded in hatching out one of these larvæ, which Mr. Coquillett pronounces to be *Scymnus marginicollis*. He further says that he bred specimens of this same beetle in Sacramento in 1883, where he found it feeding on plant lice on a thistle. I have also found in the sac of a female where it had eaten all the eggs, a small worm about one-quarter of an inch long; it being the first and only one observed by me, I left it to multiply.

Deciduous Fruits.

The apple crop this year was a very heavy one, many trees breaking with their loads of fruit; and the same might be said of all our deciduous fruits. The woolly aphis and the codlin moth do not as yet seem to have worked material injury. While the former may be kept in subjection with proper fertilizing and care, the second needs more costly bands and poisonous sprays, which every farmer should remember, and unitedly they should forever keep it in check.

The Nut Crop.

The English walnut both yielded and sold well this year, though the price has since receded from nine to seven cents on buyers' hands. On our own place, these trees have been copiously matured, and the crop is double as much as last year. These trees have not been plowed for two years, the manure being placed broadcast over the surface of the ground, and the trees irrigated during the summer. The seeds were kept in subjection with a hoe. It seems as though this tree enjoys thorough drainage and plenty of manure and water. The tree is subject to the *Icerya purchasi*. The pecan nut does well in this end of the State, making a beautiful ornamental tree, but I have never seen the nut attain the size of the Texas pecan.

Lemons.

There is a great future for the lemon in California. It is a fruit that keeps well, sells well and is ripening in fruit every month in the year. Yet it is a prey to the scale insects and to the fluted scale, the king of scale insects. But the tree itself is hardy, growing from the cutting, and will resist much drouth. It is said to be shorter-lived than the orange, but it is a more rapid grower and fruits sooner. No tree responds more quickly to fertilizers. With each new start in growth come flowers on the same new wood. It is true the major portion of the crop matures in December and January, yet we have sold on our place December lemons in June.

Oranges.

In Los Angeles county, the crop of this fruit is behind, owing to the ravages of the red and fluted scales. In many orchards, the song of the hammer is the echo of the plowboy's song. In particular spots that have been fertilized, the crop is above the average in quality and quantity. In San Diego and San Bernardino counties, the crop is said to be above the average—clean and bright. In San Diego county it may be owing to virgin soil and isolation from insects, whereas in Riverside it is free use of fertilizers and a quarantine guardian against insect pests.

The Olive.

It seems that each fruit is to have its run in California, the olive being more prominently before the people than any other tree both north and south. It enjoys exemption from the fluted scale, but is a prey to the black scale. If, however, the parasite of the black scale can continuously keep it in subjection, then so long is the

olive master of the situation. But, however well the olive may thrive on poor soil, no man should expect remunerative returns unless he can properly take care of, fertilize and irrigate. Mr. C. H. Dwinelle, now in the town of Fulton, in Sonoma county, says that the olive should not be trained as a tree, but rather as a bush with extending limbs, so that the fruit may be gathered by hand without bruising, and this idea with him is not theory, but his observation of facts in Europe.

Figs.

Figs have done well this year, some varieties fruiting for the first time, the most prominent among which are the Smyrna and the White Adriatic. In the San Gabriel valley the Adriatic takes precedence, the fruit not falling off the tree but drying thereon, and though it commences to ripen somewhat late, it ripens its fruit continuously until stopped by cold weather. The Smyrna has dropped its fruit this year, some at maturity and some before. However, another year may make a great difference in the Smyrna, and only speaks for this locality.

Fruit Culture in Several Countries.

Reports from the consuls of the United States in answer to a circular from the Department of State on the cultivation of oranges, lemons, olives, figs and raisins in their several districts, No. 413, June, 1884, is a book of which every fruit-grower should have a copy.

A. SCOTT CHAPMAN,

Commissioner for the State at Large.

San Gabriel.

Success in Berry Culture.

EDITORS PRESS:—My attention has been called to farmers, who, while growing a blackberry patch sufficient to supply the village, gather scarcely enough for their own family use. Their plants are thrifty, ground is well manured, cultivated and irrigated. An examination of the bushes shows that the plants have been allowed to grow to a height of eight or ten feet; then the tops were cut off about six feet above the ground; during the balance of the season no attention was given to the bushes, and, in consequence, they throw out branches six feet long in the fall or spring. These branches were cut back to within a foot of the main bush, the bush tied up to stakes, and a big crop of berries expected the coming season. As the season advances the grower finds that while the bushes of other berry-growers are white as a snowball with blossoms, his plants have but a few scattered over the top, and when the scorching heat of midsummer comes his berries all burn and fail to mature.

The main fault in this instance is improper pruning. The bushes for want of heading back when four feet high made their bush between four and six feet above ground, leaving the stalk below the bush unshaded. By cutting high but half the bush was formed that would have grown had the tip of the main stalk been pinched off at four feet. An examination of the branches cut off will show that the majority of the bearing buds were beyond the place of separation. The natural result is no bush and no berries. If in this article I can so simplify berry-culture as that "the way-faring man though a fool need not err therein," I shall feel that I have saved the berry-growing reader years of experimenting to attain the highest degree of success.

Having determined upon setting out a heap of blackberries, we first examine our supply of fertilizer; if it is stable manure we estimate what amount of surface we can give a yearly dressing three inches deep. Inexperience will benefit us to plant beyond that, but experience will show that one-half the number of plants, well manured, will yield berries in a greater quantity, of double the size, and superior sweetness and flavor to those grown on a poorly manured soil.

In the selection of ground for the berry patch, preference should be given to a rich, loamy, damp soil.

The best berry to grow is a disputed question, but as the Kittatinny is the largest and heaviest bearer, preference should be given to it, with Wilson's Early for the first cross.

See to it that the plants are entirely free from rose scale. If this pest is found, burn every plant, and seek a more conscientious dealer.

As the plants should be six feet apart each way, and but one plant should be set at a place, an acre will require 1210 plants, which should be cut down to the last or lowest bud, covered with moist soil, and sheltered until wanted for planting.

Look the intended patch over carefully to see in which direction the water for irrigation will run, and yet not wash, and set your rows in that course. First dig the holes, then drive a six-foot cedar stake well into the ground in the center of the hole; or, if stakes are expensive, set a stout post, well braced, at each end of the row, and at five feet above ground stretch a wire, supporting it by occasional stakes between the posts.

Set one plant to each stake, pressing the soil well down with the feet. If the planting is done in the late fall, very few plants will fail to take root by springtime and make a good growth.

With the plants in we cover the ground to a depth of three inches with manure and turn

the chickens in to pulverize and spread it. The winter rains will level out the manure, and the soil by spring be mellow as an onion bed.

Very early in the spring plow up and pulverize the soil thoroughly, at the same time striking out the irrigating ditches. From the time that the first bud shows until the last leaf has withered, see that the soil never becomes dry. It is a common practice to defer irrigation until the berries begin to fill out, which is wrong, as no irrigation gives as large returns as the water supplied in the early part of the season. It is then that the bush matures and forms its buds, and the plant will only make what the moisture at the time would supply to the plant throughout the season.

When the plants have grown to four feet above the ground, pinch off the tips; if allowed to grow higher they will burn from the sun's rays; if lower, the reflection from the ground will burn as well. With the top off, the bush will now throw out laterals or side branches. These should be pinched off when about 18 inches long. These in turn will throw out other branches, which should be pinched off at a foot's length. This will give you a stocky, well-branched and broad bush carrying all of its bearing buds so dense in foliage that the berries will not burn and branches be well braced that they will not break, and the bush so compact that it can be cultivated and its immense yield gathered with a minimum of profanity on account of weeds from the briars.

The first season is devoted entirely to growing the plants, the labor required consisting of irrigating as often as the ground becomes dry, and following with cultivator to break up the brush after irrigation. During the season the bushes are tied up securely and our labor for the first season is completed with the fall dressing of manure.

Our second season is but a repetition of the first, with the addition of gathering the reward of our labors in luscious berries and in the fall cutting out the former season's dead wood, which operation can be made pleasant if a long-handled pitchfork is used to lift out the bushes, when cut loose at the ground, and then carried to the mulch or burning pile.

Raspberry

Culture is almost identical with that of blackberries, save that the bushes can be set a little closer, and more plants set to the hill, and the tops should be pinched off at 18 inches high instead of 4 feet. If quick returns are desired, four plants can be given to each hill. If the same attention is given to secure a bushy growth that has been directed for blackberries, four times the usual quantity can be picked on a given piece of ground. Raspberries give a greater yield of larger berries, if in tying up the bushes they are well spread out along the wire so that the sun can get at every part of the bearing part of the bush.

This long but I trust explicit article would not be complete if I did not add that berries should be picked directly into the shipping baskets, which should never hold more than a quart. Any other method will result in crushed and sour berries. When possible, the berries should reach the consumer on the same day that they are gathered, as lying over night in closed baskets softens and detracts from the appearance of the berry.

Murphys, Cal.

E. H. SCHAEFFLE.

THE DAIRY.

Close Cropping of Pastures.

EDITORS PRESS:—It is generally admitted that a great part of the substance of plants is derived from the atmosphere. They imbibe water, air, all manner of gases, and so grow and mature. It would be a curious study to determine how much of a great cornstalk, when complete, is taken from the earth, and how much from the air. We imagine the better half comes from the latter. But let us suppose one-half.

A grain of corn, put in the ground, begins its work very slowly. The plant will mature in 150 days. It will then weigh five pounds, ear and stalk. This may be 1000 times the original grain. At some time in its life it grows very fast.

For the first ten days, earth and water alone nourish it, and it has not doubled in weight. But as its leaves are spread to the sun, wind, rain and dew, it grows apace. The larger it is, the faster it grows in one day. If it weigh 1000 times the first grain in 150 days, that is an average of six times a day, all the way through. But as its baby growth is so slow, the last growth is accelerated, till it must add 20 or 30 corn grains a day. It probably doubles in the last month.

What makes this difference? The size of the plant, the spread of roots and leaves. They are all workers. The baby plant does baby work, and the great plant works in proportion. For the plant to grow it must have its leaves catching nutriment.

Now, hereby hangs a tale. If you keep clipping the plant all the time and keep it bare of working leaves, it will make only a baby growth all the year, 10 days to double itself. In 150 days it will have made the weight of 15 corn grains, whereas if you let it keep all its working leaves it will make 1000 instead of 15.

Now, all the plants of grass, clover, etc., in

your pasture probably follow these same. Turn on your cattle and sheep, nip them down to the ground and almost pull up the roots, and you have a poor baby growth all summer. The weight of vegetation is 15 instead of 1000.

Should you have two, three or four pastures and let each one grow uncropped till it touched maturity, till all its working surface was at work, the ground shaded, the moisture, electricity and gases had full play, and the swiftest growth attained, would not your grass crop be vastly improved?

We have seen California six inches deep with rich herbage almost everywhere. We see it bare now. The ground is exposed to the blazing sun and dry as a burnt brick. Is not this close cropping the reason? Men have kept vast herds that have eaten every green thing and then starved to death. They served the pasture just as they did the cattle and lost both.

We feel satisfied that in California no pasture should ever be eaten down to the bare ground. The plants should be spared while they are still big enough to do some good growing; and we shall have more cattle and better beef when the pastures are all fenced and never grazed till the crop is thick and plenty.

A. B.

October, 1887.

Views of a Yolo County Butter Consumer.

"Consumer" writes to the Yolo Mail a letter on butter-making, etc., which contains some practical and valuable suggestions. We quote as follows: Having lived in Woodland some years and finding but little if any first-class butter brought in, I have been inquiring into the causes, and am satisfied that it is wholly because of either a lack of knowledge or painstaking, for Yolo county around Woodland abounds in the best of feed for first-class butter, and thinking perhaps an article from a practical butter-maker who has made butter for years for the Boston market, and received first-class prices for the same, might be acceptable also with the view of helping those who wish to learn how to make a strictly first-class article. In treating upon butter-making we say first that it is impossible to make first-class butter without the cows are properly fed; that alfalfa is good we admit, but that alone will not produce the best results either in quality or quantity. The best and most practical butter-makers of the East have given up the idea that the natural grasses even in their most perfect state are sufficient to obtain the best results. Grain is necessary not only for quantity but especially for quality of butter. The grasses will make very fair butter, but if you are looking for something fine that has a good grain and will stand up in warm weather, grain must be fed. The best kind of grain is cornmeal mixed with bran or shorts. Barley is fair, but will not add so much to the quality as cornmeal. Bran or shorts always produces good milk and much of it, but will cause the cow to lose flesh, hence enough of cornmeal or barley should be fed to keep the cow in proper condition, for poor cows are always fed at a loss under any condition whatever. So much for the feed.

To make first-class butter even of first-class milk requires a great deal of hard work, and, in fact, eternal vigilance is the price. Everything must be perfectly clean, not only the dairy utensils but the surroundings. Milk and cream are very easy to become tainted from impure air. The perfect temperature for milk to raise good cream is 62°; as near this as possible will produce the best results. Cream should rise in 30 to 36 hours, and great care should be taken that the cream shall be properly raised, and it is a mistake that you will incur a loss by skimming a little too soon, for what is lost in quantity will be made up in quality, as the last to rise is poor. The best globules of cream rise first. The cream must not stand over 12 hours after skimming before churning, and if churned sooner it is better. A great mistake is often made in churning too much. Churning should always be stopped as soon as the butter is the size of grains of wheat; this will leave the butter in nice shape for the salt to strike in; the butter-milk strained off and the butter placed in a dish and salted from one-half to one ounce to the pound or to taste, and should only be worked enough to get it together in one long loaf. Then let it stand eight to ten hours and work until the milk is out, and stop as soon as it is out; also great care should be taken in preparing it for market. Neat, attractive packages go a long way toward suiting a customer.

I am sure by following the above the butter-maker will not have streaked or salty butter, and can always find a ready sale, even when the market is glutted with ordinary butter. That the best of butter can be made in Yolo has been proved by one particular dairyman to the knowledge of the writer, who has a standing offer the year round in Sacramento (where much coast butter is used) of two cents a pound above the best Point Reyes butter. The dairy interest is a great one and should be looked into by our people. We know of a few dairies that now make good butter and that is very reliable, and get satisfactory prices, while others make butter that is not fit to cook with.

THE Colorado brand-book contains the names of 7200 Colorado owners of cattle.

WHITE or gray horses are, it is said, rarely prostrated by heat.

PATRONS OF HUSBANDRY

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Hon. J. V. Webster.

We take pleasure in presenting, with almost photographic accuracy, the outspoken face of one of the best and most favorably known members of the Order of Patrons of Husbandry on this coast.

Jonathan Vinson Webster was born in Coffee county, Tennessee, July 31, 1830, and is now 57 years old. Bro. Webster at the age of seven lost his father, and was put to work on the farm to assist an elder brother in obtaining a subsistence for his mother and sisters.

He manfully dug away, going to a common district school, when the labor of the farm would permit, until he reached the age of 18, and then, seeing nothing before him but continual toil and little remuneration, he bade the friends of his childhood adieu, and, with a company of strangers, started West. Arriving at White river, Kansas, he remained 18 months engaged in the cultivation of cotton and corn. Finding himself a sufferer from chills, he again moved his gripsack to Western Missouri, where he remained until his health was recovered, and then joined a company of engineers who were surveying a railroad route through Missouri to Red river, Arkansas. The survey completed, he started for Texas via the Mississippi and the Gulf of Mexico; but after reaching New Orleans he turned back and made for Illinois.

In the early part of 1853, he started from Quincy to cross the plains, and reached California in the October following. He settled first at Placerville and then at Poverty bar, the name of the locality being appropriate, since his belongings had by that time dwindled down to an old red shirt, a pair of old pants and a longtailed, black coat of antediluvian origin. Commencing work in the mines at one-half ounce (\$8) per day, he saved money, and by and by he removed to Alameda county. More recently he has taken his family to Creston, San Luis Obispo county, where he is at present residing.

Bro. Webster has been identified with the Grange ever since its organization in this State, and has been one of its foremost members, his interest being that of a hard worker in the ranks of the Order. He has always endeavored to advance the cause of education by all just means within his power, ever acknowledging the broad principle that difference of opinion is no crime. He was elected Worthy Master of the California State Grange in 1875, and filled the chair at the Fourth Annual Session, at San Francisco, October 3 to 8, 1876, succeeding Worthy Master J. M. Hamilton. At the Sixth Annual Session, held at Sacramento, he was elected Treasurer of the State Grange, and filled that office till the Ninth Annual Session, at Santa Rosa, when he was chosen Secretary.

Although holding the highest State offices in the gift of the Order, his qualities as a leading member have been no less conspicuous through his connection with the *California Patron*, of which he was associate editor when first issued, May 17, 1876, by Dewey & Co. After two years' service as Master, he closed his editorial connection with the paper. On March 6, 1880, he again assumed the management of the *Patron*; and that he was thoroughly imbued with the importance of the work was made apparent in the development of the journal by gradual advances to the favorable position his fearless, animated and sound editorials and able management brought it through hard work.

The Brothers and Sisters who were present at the organization of Temescal Grange, in 1873, will remember that it required some urging to get Brother Webster to accept even the office of Chaplain of that Grange, he being a charter member.

In the old California Farmers' Union, organized before the Grange movement in this State, Brother Webster was placed upon the Executive Committee and acted well his part. From that time to this he has been one of the foremost men in the Farmer's and Grange cause.

When the non-partisan movement was started at Haywards with the avowed object of electing honest and capable men to the State Constitutional Convention, regardless of parties, Brother Webster was one of the strong men who led the movement that secured the election of several good members from Alameda county. When in the Constitutional Convention, he was a stalwart position in warding off the attempts to make the Constitution one that would favor the interests of money and monopoly rings rather than afford equal rights and justice to the great majority of people. He was also in the lead in heading off those who were willing to sell their birthright for a mess of pottage, by preparing for adoption such a Constitution

as would have been rejected by the people, and therefore continued in force the old Constitution. It required a man to guard the work successfully who could command the confidence of other good men, and one who had the intelligence and ability to make his power effective against the destroying wolves in that Convention. Such qualifications Brother Webster proved to possess.

It was through his sagacity and persistent effort that provision was made for mailing an official copy of the new Constitution to each and every voter in the State, and in our judgment, that was an all-essential point in giving it success on the day of election. Each voter having an official copy in his hands, upon reading the hired newspaper lies which flooded the State, the money-power influence proved powerless, and, in many instances, no doubt, reacted against the old Constitution and in favor of the new.

Patrons who have stood side by side with Brother Webster since the beginning of the

A Good Anniversary Day.

Although the weather was very threatening on Saturday last, a goodly number of Eden Grangers met with the Temescalites at Oakland, and thus jointly, with a small representation from other Granges, had another good old Grange time.

Brother and Sister Coulter from Santa Rosa were welcomed in due season, and Brother and Sister Deming of Vallejo, Don Mills of Bennett Valley, Sister Dorman of Valley Grange, Brother Moore of Danville and Brother Frazier of Alhambra were also present.

Brother Russell, by request, kindly relieved Brother Dewey, who was suffering from a severe cold, by presiding during the afternoon; and he did it most gracefully.

Upon being requested by Worthy Master Dewey, Bro. Coulter spoke of the meeting of the State Grange at Santa Rosa, saying that

pleasant things appreciative of young Grange women which, had he spoken in season, might have made him Governor before this time. Brothers Goodenough, Perham, Klee, Chester, Renwick and Deming also made brief speeches. At the Harvest Feast and in the hall quite a number of Brothers spoke eloquently and in a manner to make the whole occasion joyous and profitable. Several Sisters also made pertinent suggestions.

By request, Brother W. T. Jones of Benton Harbor Grange, Michigan, gave two songs, which, as well as his remarks, were excellent. Sister Roxy Dennis sang several beautiful solos, which were well received. Sister Blackwood was also fortunate in pleasing the audience with her singing. Sisters Jessie Weed and Nellie Webster both recited with well-recognized success.

Brother Coulter alluded to the birthday of the Grange and its organization at Washington by the seven men, noble, good and true, but humble and without special notoriety. How well they planned, and what incalculable benefits have their works brought forth in the short space of 20 years! He beautifully compared the banding together of these men in their work to Christ's gathering together the poor fishermen as His apostles, and how the world has been moved and uplifted in the 1887 years that have intervened! He spoke of the things which we shall accomplish, but laid more stress upon the failures which have been made, and which admonish us of the true way and the good work which stick-at-it-iveness on the part of the Patrons will yet accomplish. We hope Brother Coulter, as well as other speakers, will furnish as nearly as possible the substance of their remarks, as they should go upon record.

Brother Blackwood spoke with his usual ability, and was also requested to furnish his remarks for publication. This is the first occasion on which Temescal Grange has ever celebrated the anniversary of the Order. It was the first Grange to move in the matter of celebrating this year, and to its early action, and the publications relating to this and other matters, in the Grange papers, we think is due the result of securing various good gatherings throughout the State. Let us always henceforth make as much as possible of such occasions in keeping up the true spirit of the Order in active Granges, and in reviving and enthusing the lukewarm.

Had the weather been pleasant, the attendance would have been more than double; but as it was, the occasion was so well enjoyed that the following resolution, moved and seconded by Brothers Dewey and Blackwood, was unanimously adopted:

Resolved, That we will endeavor to meet in full numbers, on the next anniversary of the birthday of our noble Order, (the Patrons of Husbandry, Dec. 4, 1888.

ANNIVERSARY CELEBRATIONS.—Among the Granges of the Golden State that observed with feasting, culinary and intellectual, the Order's attainment of its majority, were Alhambra, Eden and Temescal, San Jose, Stockton and Santa Rosa. Yuba City also elected officers on that day; and we suppose there were a good many other celebrants, yet to be heard from.

BUTTE MOUNTAIN POMONA GRANGE will hold a regular meeting in Yuba City, Saturday, Dec. 17th, at 1 P. M., when it is expected that the fifth degree will be conferred upon a large number of applicants. The charter is still held open for new members, and all fourth-degree members in good standing in Sutter or Yuba counties are cordially invited to join.

MERCED GRANGE, according to a fraternal letter just received from Worthy Master Elliott, is doing finely. What with ten new members initiated since Nov. 1st, change of quarters, Harvest Feast, work in the third and fourth degrees, and fresh applications, the Order at Merced must be wide awake and prospering.

BRO. D. WOODMAN of Paw Paw, Michigan, whose visit to this coast many Californian Grangers recollect with lively pleasure, attended the recent session of the National Grange and will have a communication about it in the next issue of the *Patron*.

By late amendment the quarterly dues from Subordinate Granges to the State Grange are to be increased from 10 cents to 20 cents for each member of a Subordinate Grange in good standing.

BRO. I. C. STEELE of Pescadero, W. T. S. G., has been occupied since he returned home from the city preparing to start a water-motor to supply power for cutting hay, grinding grain, etc.

SAN JOSE GRANGE will complete the election of officers this Saturday, and discuss "Pruning the Peach" and the "Best Varieties to Plant."

HON. J. V. WEBSTER.

Grange movement to the present time, have never known him to flinch or turn away from what he believed to be right, and just, and true to the welfare of the Patrons of Husbandry.

The famous Stockton Grange Convention proved that Brother Webster had the "courage of his convictions" every time. It was a bold stroke, and although it failed of entire success, it was not Brother Webster's fault. It furnished many good lessons to Grangers, and our legislative halls have, through its influence, been since profited by the presence of more than one Granger who would never have passed its threshold as a member except through the lessons that J. V. Webster's self-sacrificing agitation taught.

While Brother Webster sacrificed thousands of dollars in valuable time and money while Master of the State Grange and as editor and manager of the *California Patron*, he has received a large reward in the education wrought upon himself and others by his good works. He has also gained a rich inheritance in the friendship and esteem by which he has engrafted himself in the hearts and confidence of his fellow-Patrons.

ALHAMBRA GRANGE has for the 14th time elected the venerable Dr. Strentzel Master.

not only the Patrons of Santa Rosa and vicinity were much gratified with the company present on that occasion, but the leading citizens and people generally spoke in warm commendation of the class of farming and household representatives who attended. Among all the different State associations that have met in Santa Rosa, none could receive higher praise for ability and good behavior. Bro. Coulter's remarks were excellent.

The Harvest Feast, prepared by the sisters of Temescal Grange, was one of the handsomest and best of the kind for which they are celebrated, the refreshment tables being abundantly loaded and beautifully decorated. They were completely filled; but with the exception of the sisters who served, all were finally accommodated with seats.

Sister Dennis in her good, quiet way, furnished a quantity of fresh home-made butter that could not be excelled. We want no gilded premium ranch butter for our palate when Sister Dennis' gilt-cream butter is in sight! This Eden butter was accompanied with some Eden mince pies, also of rare quality.

Brother Alfred Perkins, being called upon, made some very thoughtful and excellent remarks, which we should like to have him write out for publication. Brother Russell said some

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

RECLAIMING LAND FOR BEETS.—*Examiner*: Owners of 19,400 acres of tide land on the Oakland side of the bay, situated partly in Alameda and partly in Santa Clara counties, have contracted for a \$50,000 dredger with which to reclaim these lands, the object being to put them down in sugar beets. "We will have about 60 miles of dyking," said Charles F. Burrows, one of the owners, yesterday. "Each dyke will have a 60-foot base, a 20-foot crown, and be six feet high. There are six different estuaries, and the lands extend from Alvarado to Alviso. We recently reclaimed about 3000 acres of this tract, but we needed more powerful machinery, and this is why we are having this great dredger made." W. W. Montague, W. H. H. Hart and others are owners with Mr. Burrows.

Butte.

COTTON.—*Chico Enterprise*, Nov. 25: J. B. Thrower, a prominent rancher near Nord, about eight miles from Chico, brought to town this morning two cotton bolls of good size grown on his ranch. One of the bolls had burst and displayed a fine quality of cotton ready for picking. The seeds were planted late last spring in a mixed soil of adobe and sandy loam. Mr. Thrower is of the opinion that cotton can be successfully grown in Butte county, but thinks it should be planted early in the spring to give the plant a sufficient amount of moisture.

A MODEL NURSERY.—*Oroville Register*: A gentleman who lately visited the fruit nursery of General Bidwell at Chico tells us that it is conducted in the most systematic manner. The rows are marked with the name of the fruit, what stock they are grafted on, who did the grafting, the date of grafting, the age of the trees and all other particulars that can be used in keeping an accurate record of the trees. This is all entered in one book kept by the nurserymen and in a second book kept in the business office of the general. The utmost care and attention is exercised by Gen. Bidwell and Mr. Roach, the nurseryman in charge, in order that parties purchasing trees may obtain the fruit true to its name.

Contra Costa.

ALFALFA.—*Concord Sun*: On Senator Stanford's place, three miles from Concord, Jos. Silva Perez has leased a piece of land, barely 35 acres, from which he has cut this year 175 tons of alfalfa. The crop has yielded him \$1750, an average of \$50 per acre. Although this crop is a large one, a good season, such as Contra Costa usually has, will almost double this yield.

A NICE LITTLE VINEYARD.—*Antioch Ledger*, Nov. 26: We have received from Mr. Plumley's vineyard, at Point of Timber, generous samples of grapes of the Empereur, Sultan, Tokay, Muscatel, Muscat and Black Prince varieties. One cluster of the Empereur of the second crop weighed 3½ lbs., and a single bunch of the Sultan, a grape usually grown in small clusters, 3 lbs. Mr. Plumley's vineyard comprises 10 acres set to raisin and table grapes. All have not yet come into full bearing, and this year the crop has not been so abundant as was expected; but little, if any, less than \$100 per acre will be realized from the fruit, most of which has been sold in the vineyard. The samples received are all well ripened, finely colored—the Tokays are especially handsome—and highly flavored. A considerable amount of fruit still remains upon the vines.

Fresno.

ORANGES.—*Fresno Republican*, Nov. 25: Dozens of orange trees are to be seen in different parts of this city loaded with fruit now turning slightly golden. Fresno oranges are two weeks earlier than the same varieties grown about Los Angeles and Riverside. Pet-covich has on exhibition at his fruit-store several limbs from orange trees that have on them from 10 to 50 oranges. The limbs were cut in the orchards of Mr. Jos. Burns and Mr. Hazelton, near Centerville, and the fruit is as fine as that grown in any other section.

FINANCIAL SUCCESS.—*Republican*: The past year was Mr. F. H. Ball's first experience in farming of any sort, and he does not seem to be at all discouraged by the result of his summer's work. The fruit was all sold to Geo. W. Meade & Co., the peaches and pears as they came from the trees, and the raisins in the sweat-boxes. From ten acres of peaches he received \$2522.60; from three and one-half acres young pear trees, \$101.05, and from 55 acres of raisin vineyard of three-year-old vines, \$8700; a total of \$11,323.65. The net returns are something over \$8000, a neat sum to lay away for a modest investment of capital for one season's work.

Humboldt.

THRASHERS' TOTALS.—Mr. Ferrill has furnished the *Watchman* with figures of grain handled by six different thrashers in the Eel River valley this fall, with two machines at Mattole yet to be heard from. Oats, 329,286 bushels; barley, 96,993; wheat, 12,408; peas, 6551; rye, 902; birdseed, 61; grass-seed, 206; lentils, 104; total, 446,511 bushels. The grain was all remarkably clean and heavy.

Inyo.

FOR IRRIGATION BONDS.—The *Inyo Index* heartily congratulates the people of Irrigation

District No. 1, the people of Owens River Valley, and all the people of all Inyo county, upon the happy result of the bond election of Nov. 29th. The votes as canvassed in the five divisions forming the district gave a total of 38 yeas to 23 nays.

CANAL-MAKING.—*Inyo Independent*, Dec. 3: Good progress continues to be made on the east side canal. During the week the ditching machine has been kept at work toward the head of the canal, about three miles above Independence Station. The machine continues to work as well, indeed better, than at the start, as the men and horses get more accustomed to the work. From where the machine was at work a day or two ago the distance to be made to the river is a little over a mile. The soil turned up is of the finest quality; it is mellow and rich as an ash-heap, and will be very fertile when irrigated. If the work goes on as well as up to the present time, water will be conveyed in the canal for a large amount of land early in the spring.

Lake.

PLANTING CRANBERRIES.—*Avalanche*, Dec. 1: E. C. Riggs has received 1000 cranberry plants from Z. K. Jewett of Sparta, Wis., and will set them on some marshy ground he has. If successful, he will plant several acres to cranberries. We think this may prove a paying industry in some portions of Lake county, and hope Mr. Riggs will succeed in his experiment.

Los Angeles.

WESTMINSTER ITEMS.—*Cor. Times*, Nov. 28: Affairs in Westminster are quietly prosperous. Corn-husking and cribbing and potato-harvesting have kept the farmers busy, and field-hands have been scarce. Hay-balers have yet many tons waiting for them. The rainfall was .65 of an inch, and the roads are now in good order.

Marin.

HEAVY GRAPE CROP.—*San Rafael Journal*: The most prodigious yield of grapes we have ever heard of is recorded of six acres on the Novato ranch, from which Mr. DeLong this year gathered 102 tons of Mission grapes, not in two or three crops, but all in one. The grapes were sold at \$12 per ton on the ground—a yield of more than \$200 per acre.

Mariposa.

EDITORS PRESS:—On the dinner-table at the ranch owned by Marshall Harris, Thanksgiving Day, were green corn "roasting ears" and new potatoes. This place is over 3100 feet above sea level, 36 miles from the Yosemite valley, and is noted for the fine fruit raised there, especially apples, for which Mr. Harris finds a ready market in Merced and Fresno. Some that he shipped to S. F. brought \$4 per 50-pound box.—W. L. M., *Grant Springs*, Nov. 25th.

Monterey.

EDITORS PRESS:—Since the rain, the grass has started, and it is already green in places. Plowing will commence this week. There has been some dry seeding done. We have a great advantage in our soil here; unlike the adobe, when our harvest is over it is ready to plow again. Some of the farmers plow in the fall when their land is not foul. Summer-fallow always proves the best here. There are quite a number of people camped in the vicinity, looking for land to buy or take up. There is very little land worth taking up left now, unless it would be for vineyards. I think most of the hills would bring very good grapes, but it requires some labor to clear brush and prepare the ground. Grapes will grow on very dry soil when properly cultivated; they will grow between rocks where there is any moisture at all. This is a very poor country for feed; it was pastured with sheep so long that they almost destroyed it for feed. Sheep in traveling over the land bring all the gravel to the surface and make it look worse than it really is.—E. E. M., *Jolon*, Dec. 5th.

SAN LUCAS PROSPECTS.—*Cor. Salinas Index*, Dec. 1: San Lucas, although young, is a stirring burg with a promising future. It is surrounded by thousands of acres of first-class land, especially adapted for fruit and grain, on all of which excellent water in unlimited quantity can be struck at from 10 to 50 feet from the surface. Upward of double the acreage seeded last year will be brought under cultivation this season if times are any way propitious, and the plains, two years ago roamed over by sheep and cattle, will in a few months, by the hands of industrious settlers, be transformed into a vast expanse of waving grain.

Napa.

OLIVES BEARING.—*Register*, Dec. 1: At Napa Soda Springs there are 75 or more olive trees growing. They were planted out four years ago, and 10 of them are already bearing. A branch from one of them, loaded with ripe olives, has been placed upon our desk. A gallon or more berries per tree can be gathered from some of the trees. This is something remarkable for trees of that age. At Mr. Estee's "Hedgeside," there are a large number of olive trees in bearing, and their fruit will be seen with Napa's exhibit in the State Board of Trade rooms, S. F.

San Diego.

SUPERIOR SPUDS.—*San Jacinto Register*, Nov. 24: Last Saturday G. D. Spittler brought to this office some Irish potatoes of the White Elephant and Peerless varieties, which were raised on the mountain ranch of M. M. Onstott, five miles east of A. Sherman's mill. The potatoes are the best and largest that it has been our lot to behold. Mr. Onstott has a bonanza

in his mountain ranch if only for raising Irish potatoes. . . . Hardly had Mr. Spittler left when Robt. Shaw appeared with a half-dozen or more sweet potatoes which almost filled the wheat sack in which they were carried, they were such monsters. J. N. Huston took one to Kauffman & Haas, and it was found to tip the scales at six pounds. A much larger one had already been carted away by the "devil." Mr. Shaw planted the sweet potatoes just the same as he did his Irish potatoes, although the general rule is to first plant in a hot-bed and then transplant.

ARTESIAN WATER.—*San Diego Union*, Nov. 18: Less than three weeks ago the San Diego & Coronado Water Co. commenced boring an eight-inch artesian well at their works, about half a mile east of Old Town. After the sand of the river-bed had been passed, a stratum of clay was reached. Then came a layer of boulder and gravel, after which one of micaceous sand was reached at a depth of 70 feet. At this point the drill became clogged with the fine sand that continually fell in, but as soon as this was removed a flow of 24,000 gallons per day was obtained. Since then the flow has increased steadily, until now a stream of pure water is running from the pipe at the rate of 400,000 gallons every 24 hours. The water is soft, limpid and delicious to the taste. The two other eight-inch wells are being sunk at the water works, one of which is nearly completed, and work on the other is well under way.

VINEYARD COMPANY.—Articles of incorporation of the El Cajon Vineyard Co. were filed at San Diego, Dec. 2d. The capital stock is \$240,000. C. M. Johnson, S. M. Marshall, S. B. Bliss, H. F. Johnson and A. R. Bliss are the directors. The company is formed for the purpose of developing and maintaining vineyards.

Placer.

LATE PEACHES.—*Auburn Republican*, Nov. 30: Down on the Greeley ranch, below Newcastle, are some ripe peaches hanging on the trees. They are of the variety known here as the Winter Freestone. There are not many trees in this locality, and the fruit rarely ripens.

Sacramento.

PICKING GRAPES AFTER THANKSGIVING.—*Record-Union*, Nov. 28: John McNie of Florin to-day brought to this office a box of fine Muskat, Flame Tokay and Rose de Peru grapes, picked from the vines yesterday. They were of mammoth size and delicious flavor. This will be a hard story for those who reside in the regions of "six months winter and six months mighty late in the fall," but it is true, nevertheless. In fact, the markets of Sacramento are now supplied with grapes fresh from the vines.

San Joaquin.

PREPARING FOR FRESHETS.—*Stockton Mail*: Repairs are now being made on the island levees. On Union and on the main levees of Roberts' islands dredgers are employed. Mr. Ferris has had a dredger at work on the lower division of Roberts' island almost constantly for a year and a half. The expense of getting ready for the regular winter freshets is a heavy tax on the owners of reclaimed land, as the levees must be repaired annually. Last year over \$12,000 was expended in protecting Rough and Ready island, and this year the expense will be \$3500. The money is raised by a tax which is levied on the 1685 acres benefited.

S. L. Obispo.

OSO FLACO POTATOES.—*Arroyo Grande Cor. Tribune*: Phillips Bros. have on exhibition at their store some spuds from Oso Flaco, that beat the record. Three Burbanks weigh nine pounds and two White Elephant seven and one-half pounds. These are not potatoes with warts on, but good smooth ones. Those with small growths on run up as high as 10 and 12 pounds.

Stanislaus.

MODESTO JOTTINGS.—*News*, Dec. 1: A band of about 2000 sheep passed through town to-day, going south. . . . Major James Burney has been appointed agent at Modesto for the Capital Nurseries, Sac., W. E. Strong & Co., proprietors. . . . Several large pears raised on the ranch of J. E. Stewart, adjoining the city on the north-east, are on exhibition in Clayes' show window. They are fine specimens. . . . C. C. Baker brought to town a nine-pound potato, which from all sides represents heads of potent animals and various articles. It is a curious freak of nature. . . . In the Turlock Irrigation District, T. G. Yancey of Modesto and Mr. Fife of Stockton have purchased the Otis Perrin ranch five miles southwest of Keys Switch, consisting of 400 acres, for \$8200. Also 200 acres on the Stanislaus river, two miles this side of Oakdale belonging to Andrew Olsen has been purchased by W. A. Stuart of Sacramento; consideration, \$10,700.

Tulare.

CALVES DYING.—An unknown disease broke out among the Holstein calves of Sheriff Parker last week and two of them were found dead in the alfalfa pasture a few mornings since, while a calf of another breed died before a remedy could be administered. Mr. Parker says the disease was never known here until the introduction of alfalfa.

MIXED MENTION.—*Visalia Times*, Dec. 1: Numerous "bee-trees" are to be found in the timber belt surrounding this city. The first of this week Rev. and Virg. Sparks and Walter Barnes cut a limb from a tree near the cemetery that yielded about six gallons of honey. . . . Wherever almond trees have been set out in this county they have made a good growth and

proved very productive. . . . On the 23d ult. Thos. Kelly brought into Porterville a fine sample of turnips raised on his ranch. One of them weighed 5½ pounds and measured 25½ inches in circumference. . . . Several ranchers in this vicinity have signified their intention to plant small patches of sugar beets this season, and after their ripening have them analyzed and ascertain the percentage of saccharine matter they contain.

BROOM-CORN.—V. P. Ludlow, the broom manufacturer, before leaving the East, procured broom-corn seed in Indiana for use in seeding land in California, entertaining the idea that as Indiana broom-corn was the best raised in the Middle States it would prove the best for cultivation here. Last season he sowed his Eastern seed and also some that was raised here. The Indiana seed produced a straw 12 to 14 inches in length, while the California seed furnished a straw 18 to 20 inches in length and of extra quality. Everywhere in the county that broom-corn has been planted it has yielded abundantly, the straws being of good length, strength and fineness—the latter quality being one of the requisites in the manufacture of a first-class broom. As broom-corn brings from \$60 to \$90 per ton in S. F., its cultivation should pay, even with the high freight charged for its transportation to that market.

ARIZONA.

PEARS AND ALMONDS.—*Phoenix Herald*, Nov. 22: Maj. G. W. Ingalls to-day exhibited at the *Herald* office a basket of pears gathered at the ranch of E. O. Slocum, just north of town, of which eight pears averaged 17½ ounces each, and the largest weighed 20 ounces. They are of the Winter Nelis and Vicar of Winkfield varieties. He also gathered at Mr. Slocum's place a peck of elegant soft-shelled almonds, which he showed us, and they were fine both in size and flavor.

TOMBSTONE is organizing a fair association, and why not? Tombstone has a good stock country about her and the San Pedro valley to draw from in an agricultural way, while her mines are yet among the best in the Territory.

OREGON.

WILD FIRE.—A *Chronicle* dispatch from Portland, Dec. 2d, reports a disastrous fire in Grand Ronde valley, Or. Sparks from a passing locomotive set fire to an immense body of dry tules, and the flames swept over a large portion of the valley. In that neighborhood are several extensive cattle farms who have thousands of tons of hay and many hundred head of cattle in winter quarters. The fire destroyed all the hay, and the cattle were in danger of being burned to death. A strong wind was blowing at the time, and the flames spread very rapidly. The loss falls heavily on the stock-owners of Grand Ronde valley, especially at this season of the year. It will be impossible to replenish the stored hay, and should the winter be severe the loss of stock will be enormous.

The Oroville Citrus Fair.

We have received a card of invitation to the Oroville Citrus Fair and a circular relating thereto, which shows that the exhibition will have novel features, some of which have, however, been previously mentioned in the *RURAL*.

The fair will be held at Oroville, in Butte county, in a canvas pavilion, commencing Tuesday, December 20, 1887, and will continue five days. Full and varied collections of oranges, lemons, limes, olives, persimmons, pomegranates, olive oil, raisins, vegetables, cereals, etc., all products of Butte county, will be placed on exhibition, and no doubt the display will be a notable one. The holding of a citrus fair in a canvas pavilion in the month of December may appear to be novel, yet it is hoped thereby to demonstrate "that in Northern California can be found a climate as mild and equable as that of sunny Italy or balmy Spain," as the circular puts it. As stated last week, there will be a cheap rate on the Southern Pacific railway from San Francisco during the fair.

THE WOOL INTEREST.—A meeting of woolmen was held in this city at the office of Christy & Wise on Monday morning of this week. A full discussion was held, showing that the local wool interest is most strongly opposed to any reduction in the tariff on wool, and proposed to do all that can be done to bring their influence to bear upon Congress to that end. P. B. Flint, John H. Wise, Gardner Ball, John Shober, R. F. Parks and T. L. Whitney were appointed a committee to draft resolutions expressing the views of those who were present, to be forwarded to the Wool-Growers' Association and our representatives at Washington. It was also resolved to appoint a committee of five to represent the California wool-growers in Washington, to be appointed by the chairman at a subsequent meeting.

ANTI-DEBRIS.—The Sutter county Grand Jury, at their recent session, tendered a vote of thanks to George Ohleyer for presenting before the body the various phases of the anti-debris war. The actions of the Board of Supervisors in all such matters were heartily indorsed, and the advice was extended to them to carry on all suits until victory is secured.

Mushrooms.

Amid the pearly mists of rain,
Last night in dashes pouring,
I, watching from our window-pane,
Saw troops of fairies soaring.

Poor things, they meant to give a ball,
For grief they all were weeping!
I left the sight at nurse's call,
She said I should be sleeping.

And now across our door-yard's green,
Its velvet turf adorning
With dainty dots of snowy sheen,
Umbrellas lie this morning.

Wee, wee umbrellas lined with pink,
And still with moisture dripping,
They sheltered restless fays, I think,
Who longed to be a-tripping.

—Florence Brown, in the American Magazine.

Making Over Dresses at Home.

[Written for the RURAL PRESS by FRANCES M. PAYSON.]

There is a great deal of "knack" about this branch of dressmaking, and in no direction does natural taste and tact show for more than in trying to make "something out of nothing," as I heard one little woman put it.

It is a great mistake to slight the making of a suit and think it unnecessary to take pains because it is old, for often old material, properly cleaned and "revamped," comes out in a new and charming costume with little or no expense, and it certainly gives a vast amount of satisfaction to make a pretty new suit out of something otherwise worthless. The first step in the making over is to rip carefully all your material. It is a good plan to spend spare moments when you have no new work ready to take up in ripping old garments ready for the wash.

When the stitching is done on a lock-stitch machine, it pays better, unless you are short of material, to run the scissors along close to the seam and cut rather than rip the pieces. Having ripped or cut all your pieces and picked out all threads, examine the goods carefully to find all the spots, so that you may be sure to get them out in the wash, for after the goods are wet it is impossible to tell the soiled from the clean.

Try washing a little piece of your goods first to see if it will change color. If it is too delicate, clean it by a thorough shaking, brushing, or whipping, after which sponge it over carefully, rubbing the spots well with the following preparation for cleaning, which is a most excellent recipe and seldom harms the most delicate colors even in silks and ribbons.

Rusty black goods should be dipped after cleaning in strong coffee, which will freshen it and take away its greenish look.

Press heavy goods while damp—not wet—on the wrong side, with a hot iron. More delicate materials, or those which you do not wish to make shiny on the wrong side, press on the right side, laying a damp cloth over the goods. Never rest your iron on the right side, as it glosses the goods. Sometimes a hairy, woolly piece of material looks better to be ironed on the right side without the cloth, as it lays the nap, but it is usually unsafe to try it.

Unless, however, your material is of a very delicate and fading nature, it will look far better to be put right into a washtub of hot water in which a handful of borax has been dissolved, and thoroughly scrubbed, piece by piece, on a washboard. If greasy, add fine white soap, and even if a durable color, rub it directly on the greasy spots. Most all wool goods come out of the wash looking like new, and I have even seen the treatment repeated two or three times without detriment.

Having now gotten your material ready, decide how you will make your suit, or in selecting a style bear in mind the general shape of your pieces. Don't plan shirring when your goods are all on the straight way of the cloth, nor pleats when it is mostly bias. Try to pick out a pattern which admits of using the shape of the piece you have to advantage.

Select the best pieces for the front or side breadths and save the poorer for the back draperies, as these, on account of their looping, may be pieced a good deal. If you already have a piece used for drapery, turn it end for end, or bring the worn and faded parts up in the gathers. If material is scanty, you can piece it widthwise, just underneath where the main loopings come, and the part which hangs may be matched and pieced lengthwise several times. Piecing can be carried to a great extent if you carefully press every seam flat. Let me beg of you not to neglect this and think it of little moment; it makes all the difference between neat and slipshod work. It is so little trouble to have an iron/setting on the stove and a pressing-stand ready, and 'tis so much easier and quicker

to work over nicely pressed work. Wet every seam and press it dry or it will rise again.

Pleating may be made out of the little bits, as piecing may be done here very nicely, indeed, if you have patience inexhaustible, you may run a seam under every pleat and it will never show when pressed.

Select the strong parts for sleeves and don't piece your uppers except under a cuff. The unders, if very narrow, especially if the goods is of a mixed pattern, may sometimes be pieced two or three times without being noticed, though 'tis best to piece them only down the middle lengthwise, as the edges are the noticeable part.

If your basque fronts are too small or the buttonholes are worn out, set in a vest (or a simulated one) or put on trimming to hide a seam down each side of the front. If the bottom of the basque is too tight in the back for the now fashionable bustles, split it up the back seam, face it and finish with buttons, or set in a straight piece and boxpleat it up underneath to a postilion back, or set in a fan of the same. If the basque is too short, lengthen by trimming with a bias fold put on smoothly.

There are endless ways which ingenuity suggests for using old material, and if care is taken it is often hard to tell that a suit has ever been in the washtub.

THE LABOR QUESTION.—Edison, the electrician, in reply to the question, "When motive power gets to be four times as cheap as it is, what will become of the laboring man?" said: "He will be enriched by it. Machinery will be his slave. See how machinery has multiplied in the past 50 years. As a direct result, workmen get double the wages they did then, and the necessities of life cost only half as much. In other words, a handworker can to-day buy four times as much with 10 hours of work as his father could 50 years ago. For the first time in the world's history, a skilled mechanic can buy a barrel of flour with a single day's work. The machinery in the United States represents the labor of a thousand million men, or 50 times as much labor as that of all the men in the country. When motive-power is still further cheapened—say in another generation—I believe that the unskilled laborer, if sober and industrious, can have a house of his own, a horse and carriage, a library and a piano. It is terrible stupidity that leads some laboring men to suppose that machinery is their foe. It is the thing that gives them independence and even freedom. Without machinery society would drift into the condition of master and slave. The multiplication of machinery means for every worker more food, better clothes, better house, less work. In fact, I believe that the indefinite increase of machinery is going to solve what folks call 'the labor question'—that is, the desire of hand-workers to get a bigger slice of the margin of profit."

A HINT FOR HOUSEKEEPERS.—The *Indiana Farmer* tells how a lady put to flight a tramp who called a few mornings ago and asked for cold victuals. He was given a plate of oatmeal mush, some raw, dried prunes, a tomato, and a saucer of hominy, the whole without seasoning of any kind. "I—I—can't you let me have some milk and sugar, salt and pepper?" inquired the embarrassed tourist as he surveyed the spread. "Milk is not wholesome," replied the lady of the house, sweetly, "and we never use condiments. I can let you have some cracked wheat if you like." "Haven't you any meat?" "Oh, no! we never use meat; it is not fit for the human stomach. Would you like some gruel?" "Is this the kind of stuff you live on?" "Certainly, my friend. Meats, seasonings, gravies, condiments of all kinds, and heating foods have a tendency to injure the coating of the stomach, impart an unnatural condition to the system, and—why, here, let me read a chapter of this book to you. I can show you in half an hour—" With a yell of consternation the tramp fled. As he went through the front gate he paused long enough to write on the gatepost with chalk these words, for information of other tramps: "Krank! Keep away!"

HE OBEYED ORDERS.—The *Santa Cruz Courier-Item* gives an example of literal and unreasoning obedience to instructions. A gentleman who lives on Beach Hill, and has a fine lawn and flower garden, hired a Chinaman a few weeks ago to work about the house. Among other things he was instructed to sprinkle the flower garden with the hose at 5 o'clock each evening. This duty was faithfully performed—very faithfully. Last evening, when the owner of the lawn went home, he found the Chinaman standing in the rain, holding an umbrella over his head, and sprinkling the flowers.

A LIAR PUNISHED.—A Nova Scotia woman went out into the field to bring in a horse. She held out her hat, as if she had some oats for him; but it was empty. When the animal discovered the fraud, he turned and kicked, his feet striking her in the forehead. She was unconscious for two days, and it is doubtful if she will recover.

JAVELLE-WATER, used to remove tea and coffee, grass and fruit stains from linen, is made thus: Mix well in an earthen vessel one pound of sal-soda, five cents worth of chloride of lime and two quarts of soft water.

How to Learn About Entomology.

Now that the law requires instruction in entomology in the public schools, we trust that every effort will be made to make the study inviting and profitable. Much rests with the teacher in the way the subject is presented and interest awakened. We have not seen anything more hopeful for the study than the report which we give below from the *Register* of San Jacinto, San Diego county.

PUBLIC SCHOOL, Nov. 4, 1887.—According to previous adjournment, the last meeting of the Agassiz Association was devoted to entomology. After the calling to order, roll-call, reading of minutes, committee reports and other routine business had been transacted, the president called upon each member in succession to bring his contribution to the day's exercises. Each member, as his name was called, exhibited a mounted insect specimen, collected, classified and labeled by himself since the last meeting. Each of these specimens was accompanied by a short essay, explaining and classifying the specimens, giving in many cases detailed drawings of the insect as a whole and of its parts. These essays were all written upon uniform paper, and were preserved by the Curator for future reference. Many of the members also made large blackboard drawings with colored chalks to illustrate their essays. Some of the exercises were as follows: Milton Bates brought in a specimen of beetle and made a large drawing of its leg, showing the scientific name and use of each part. Minnie Cree read an essay calling attention to the value and attractiveness of entomology, illustrated by a blackboard full of large drawings showing a typical insect in the larva form, the pupa form, and in its final perfect condition, a beautiful butterfly. Mand McCormick presented a fine specimen of wood-borer with drawings on blackboard and paper. Charley Stoddard's specimen was a grasshopper, very neatly drawn on paper in different positions, with detailed drawings of its parts. Thomas Fairchild showed a large green tomato worm, then exhibited the same insect in its pupa form, and finally called attention to a blackboard drawing several feet square of a magnificent moth, the perfect form of the same insect. This was considered to be the finest drawing of the day. William Russell brought in and exhibited to the society a series of comic drawings of grasshoppers. They excited much merriment. Miguel Estudillo brought in a butterfly, and created a great deal of amusement by describing the adventures that befell him while capturing it. Mr. Hyatt gave a short lecture showing the difference between good specimens and bad ones, and explaining in detail the four forms of insect life. Mary Anderson explained the difference between butterflies and moths and showed drawings of the scales on the wings of butterflies. Fische Foote, Carrie Clark and Minnie Todd sang a song about the charms of "Gathering up the bugs from the green fields." The secretary's table at the close of the meeting showed a remarkable collection of insects to have been made in one place within the space of three days. Every one of the order of insect life was represented. More than 50 specimens, belonging to more than 25 different species, were there. The number of species from each order was as follows: Hymenoptera, 5; Lepidoptera, 9; Diptera, 2; Hemiptera, 3; Coleoptera, 1; Orthoptera, 5; Neuroptera, 1. The society was assisted in making its collection by several members of the intermediate departments, especially Una Atwood, Willie Cresmer, Albert Reinhardt and Ernest Jenkins. A lack of space prevents mention of the many points of interest and information contained in the essays and remarks accompanying the specimens.

WILLIAM FOWLER, President,
CARRIE BATES, Secretary.

The Home or the Saloon?

The following notice, headed "To the Public," and signed with the woman's full name, appears in one of our California exchanges:

"It sometimes becomes necessary for a woman to protect herself, and when such a state of affairs exists she must use the best means of defense at her command. My husband, when at himself, is a gentleman, a good mechanic, a liberal provider for his family, and a good husband and father. When under the influence of liquor, he is the reverse in almost every respect. His habits of conviviality are such of late that he is fast becoming a wreck; and while I regret the necessity of the course I am compelled to pursue, I say now that I shall fully enforce my rights under the law against any and all of those who disregard the following notice:

"From and after this date I will prosecute to the full extent of the law any person selling, furnishing or causing to be sold or furnished any intoxicating liquors to my husband, —"

Is a man, who would for lucre's sake disregard such an appeal as the above implies, fit to cast the ballot of an American citizen, or deserving of the protection of our laws?

FEATHER CARPETS.—The Japanese make carpets of feathers, said to be both durable and beautiful.

Athanasia.

The ship may sink
And I may drink
A hasty death in the bitter sea;
But all that I leave
In the ocean-grave
Can be slipped and spared, and no loss to me.

What care I
Though fall the sky,
And the shriveling earth to a cinder turn?
No fires of doom
Can ever consume
What never was made nor meant to burn.

Let go the breath!
There is no death
To the living soul, nor loss, nor harm.
Not of the clod
Is the life of God—
Let it mount as it will, from form to form.

—(Chas. G. Ames)

Fannie H. Avery.

Thousands of our readers, who never looked into her bright, brown eyes, have made pleasant acquaintance with Mrs. Fannie H. Avery, in our "Home Circle," through her contributions in prose and verse; and many will share the sorrow with which we announce that she will never lift the pen again. Her lungs had long been troublesome, and her friends concerned about her, but she was up and out of doors until a fortnight before her death, which occurred quite unexpectedly the last day of November.

She was born in San Francisco in 1860—being a daughter of Peter Job, whose restaurant was somewhat famous in its day—and was brought up and given a common-school education here; but twice in the course of her girlhood she made trips across the Atlantic and visited Great Britain and Paris.

At the age of 18 she married Geo. H. Avery, whom she leaves with their two little children, George and Fannie. They lived for a considerable time in Arizona; but she returned to her native city before her husband, and there was a period of many months, during which he was there, while she was here, regularly employed in proof-reading. For the past year and more, however, the family has been together in San Francisco.

Of Scotch extraction on her mother's side, Mrs. Avery combined with French vivacity the energy and grit of the Caledonian. Her mind was active and inquiring. She had lively intellectual ambition and aspirations, and beside her contributions to our columns, wrote a good deal for the *S. F. Post* and the *News Letter*. At one time, we remember, she was an eager and enthusiastic reader of Thoreau; then ardent in the study of astronomy; and at Mrs. Sarah B. Cooper's bible-class she was a frequent attendant and a fearless questioner.

On the afternoon of Friday, Dec. 23, a few friends gathered around the casket, and two of those whom ties of kindly interest and personal affection had drawn thither conducted a brief and simple funeral service of prayer, scripture and spoken word. One read Mrs. Avery's own verses, "His mother made him a little coat," which appeared in the *RURAL* of July 16, 1887.

"Tis long since Samuel's mother wrought
A little coat for him to wear,
In token of her loving thought,
Her tender, unforgetful care.

Strong emblem of maternal love!
Sweet story from a distant age!
We mothers prize it far above
More striking themes on history's page.

For we, too, fashion little coats
For loved ones of our own to-day;
While Fancy many a banner floats
Above our needle's gleam and play.

The prophet's mother's hopes and fears,
Her love, are changeless links that bind
Our hearts to hers through all the years,
And ebb and flow of humankind."

And the closing stanzas of her later "Mamma":

Who always is at hand to hear
Their little troubles, saying, "Dear,
I'm sure 'twill be all right, don't fear?"
Mamma.

Who loves them with a wondrous love,
That is all earthly love above,
Which she would every moment prove?
Mamma.

And the thought came quickly that the great Father-Mother Love, wherein we are all embodied—the Love out of whose soundless depths spring all the loves of parents and children and brothers and sisters and friends—does not fail to clothe upon a right the life which so lately informed the beautiful but lifeless form, now forever discarded as an outworn garment.

She had in her 27 years a varied and sometimes sore experience, but on that dead face the departing spirit left a look that was more than peaceful, a look that seemed almost ready to break into a smile at the remembrance that any of those trials, forever past, had seemed hard and heavy in the passing, and as there came to mind Elisha's question to the Shunammite mother: "Is it well with the child?" there rose up also, with strong inward assurance, the same old answer: It is well.

THERE are 60,000 women farmers in Ireland.

YOUNG FOLKS' COLUMN.

Edith.

(Written for the RURAL PRESS by AGENT SUSIE.)

"O mamma! I have a letter from aunty, and she wants me to go and make her a visit; do you think I can?" exclaimed Edith Brown, as she ran in from the postoffice, where she had stopped for the mail, on her way home from school.

Mrs. Brown thought a moment, then said: "Yes, dear. I think you can go, when school closes next week, but you will have to go on the cars alone, for I can't leave home to go with you."

"O well, mamma, you know I am 13, so of course I can go alone."

Edith counted the days, and they seemed to pass very slowly, she was so impatient to visit her aunty, who lived on a ranch. At last the long-looked-for day and hour arrived for her to start on her journey. To be sure she only had an hour and a half to be on the train, but it seemed quite a journey to her, as she was going alone. She amused herself looking out of the window, and saw lovely woods with a merry stream running along over stones, that in some places dashed the water into white foam, and then again she saw in the distance beautiful hills and mountains, then all at once the train plunged into a long, dark tunnel. It made her heart beat a little faster, still she wasn't afraid, though she felt very glad when they came out in the sunshine again.

There was a lady near her who had a little baby-girl. Whether she was sick or only cross, nobody knew, but she cried and fretted till her mother was worn out. Edith loved babies, and she asked the mother to let her take the little girl, which the poor tired mother was very glad to do. Edith amused her, and she was soon laughing and crowing in her baby glee. Edith was so taken up with her, the time passed quickly, and her journey seemed very short.

When the train reached the station, her aunty was there to meet her, and they had a pleasant ride out to the ranch, about six miles right up into the mountains, and through shady nooks part of the way. As soon as they reached the ranch, she began a tour of the place and found plenty to see.

One day the men were thrashing wheat for the hens. They spread it on a clean place, where the ground was hard and smooth, then took four horses to tread it out. The two front ones had bridles and one had a saddle. The two back ones were tied to the tails of the front ones and looked very funny indeed.

Edith longed to ride the leader, and at last she got on and had a fine time riding round and round, guiding the four horses nicely. As her aunty watched her, it seemed very much like work, but Edith thought it was great fun. She found something new to interest her every day, and did not spend her time in play, either. She helped her aunty peel great, luscious peaches to make preserves of, fed the chickens, and helped in many ways, and was as happy as a busy little girl should be. I don't believe idle girls are ever very happy. They tire of their constant play, and need some real duties to keep them happy and cheerful. You know it is said: "All work and no play makes Jack a dull boy," and I don't doubt it is true, and think I can suggest a line that is also true: "All play and no work makes Jane a dull girl." Girls long to reach womanhood, and when in their "teens" feel very grand, and think they know a great deal more than they really do, and are not always willing to share with mamma little cares, duties and burdens of life that each day brings to any and every home, and that a girl of 13 can take, with no harm to herself, and be a great help to mamma.

One day Edith and her aunty went down to the beach, where they found a long stretch of smooth sand that was nice to walk on. They watched the waves as they came tumbling in, making a line of white on the sand. It was a lovely warm day, so Edith and her aunty went in the surf bathing. Both could swim; but Edith with her fresh young strength far outswam her aunty, who had to call her back for fear she would go too far out. Her swim on her back and side and tumbled about, having a fine time. After their bath they sat on the beach and ate their lunch, with appetites sharpened by their exercise. They watched the flocks of little tiny birds called "Mother Cary's chickens," which ran along the sand and when a wave came in would scamper back like so many children. They looked black as they ran; then all at once the whole flock rose and flew off, and as they did so looked like a sheet of white, and as they turned and swayed about would show the black side of their wings again.

Edith wanted to go in the museum, so they did, and saw many beautiful shells, sea mosses and curiosities that had been taken from the "mighty deep." Then they had a pleasant ride home in the cool summer twilight.

Edith had the promise of staying two weeks, and her mamma wrote for her to go on a certain day and that she would meet her at a station a few miles from the one nearest where they lived, but did not say she was going to take the train at that station, so Edith and her aunty supposed Mrs. Brown wanted her to get off at this station; so when she took her to the train, checked her little trunk there, and sent her off well pleased with her visit, and when the train reached that station she jumped out as

quick as she could to find her mamma. But alas! things get dreadfully mixed up and crooked sometimes in this world. Mrs. Brown meant to have written that she and papa would get on the train at that station, so they did get on, missing Edith as she jumped so quick. They hunted all through the cars for her, while she, poor child, was hunting for them outside. At last the train started on. They comforted themselves with the thought that she had not started for home, and that a letter would tell them all about it, so went home, not very much worried, while Edith was left alone in a strange place, and began to be very anxious as to how she should get home. At last a kind gentleman, who saw her walking about with a troubled look, said, "Little girl, are you waiting for some one?" Edith told him she had somehow missed her parents and did not know how she could get home. Just then a man who heard what she said, stepped up and told her he would take her home in his wagon for five dollars, but she thought that was too much to pay. Then the gentleman who spoke to her first, said she had better take the freight train to the station nearest her home, and then she could walk the four miles from there to her home, if no other way could be found. So with a very lonesome feeling she took the train which soon came along, fortunately, and when she got out, was much relieved to see a man who lived not very far from her home. He asked her if her papa was coming for her, and when he heard about her trouble, he very kindly said she could ride as far as he went, and then would only have one mile to walk. So she gladly climbed up into his wagon. She had some lunch that her aunty had given her, but was too worried to eat. Though her head ached, she did not realize that a little food would make her feel better and stronger to take the long walk. She was thoughtful enough to leave her little trunk with the baggage-man.

When they came to the crossroads she thanked the man for her ride and started off on her long walk. It was summer, but was after seven o'clock, so was not very light, and as she plodded on through the dust the tears would come. Now and then a belated bird gave a little chirp as it flew to its nest; but she did not heed it, just hurried on as fast as she could. He who watches even a sparrow fall watched over her, and she reached home safely but very tired, and it seemed a sad ending to her pleasant visit. Her parents were so surprised when she walked into the house that they hardly knew what to say. Her mamma said: "Why, Edith, where have you been?"

She replied amid her tears: "I've been walking home."

"Walking home from where, child?" asked her papa.

Then she told them all about it; and, after they had talked it over, it did not seem strange. They thought they wanted her to get off where she did. They were very glad she had met kind people, and said she was brave and thankful to have gotten home, and felt very thankful to the Good Shepherd who had watched over His lost lamb.

What Became of Uncle John's Rubbers.

(Written for the RURAL PRESS by TOM WILLIS.)

Susie found this in an old note-book in mamma's trunk, and brought it to me to read, and, at her request, I have given it to the public, word for word.

In the first place, just after Uncle John (that's grandpa now) had brought them home from the store, Lulu wanted to know what they were for. Lulu was told, but she resolved to do something else with them. When Uncle John had retired to his room for an after-dinner nap, Lulu, a mother of 19 dolls of all kinds and both sexes, carried the rubbers into her play-room, put all of her dolls in them that could be crowded in, found the scissors and cut holes in the rubbers, then putting the arms and feet of the unlucky dolls through. Tying strings on the rubbers, she drew them, one by one, through the hall and around the porch. Suddenly the tea bell rang. Lulu left both the dolls and their queer carriages by the nursery door, and hurried to the dining-room, little thinking when she would see her dollies again.

After lunch, four-year-old Tommie came through the hall, and spying the rubbers and their odd carriages, he thought what excellent boats they would make; he then carried them upstairs. Luckily for him, Lulu and her mother were out riding, and the hired girl had company in the parlor, so he passed out unmolested. There was a tub of clear water on the back porch, and in this he sailed his queer craft. Suddenly one of the rubbers sank and faithful Tommie reached after it, but in the endeavor, sank the other, and tumbled in himself. First pulling out himself, and then the rubbers, he threw Lulu's pets in the sink, and carried the overshoes out in the garden. Carlo, Tommie's pet dog, seized them, buried one and chewed the other. When Uncle John came home at night, no one knew what became of the rubbers, not even Carlo, who wagged his tail and barked as brisk as ever. But the doctor *did* know that Tommie had the croup, and papa knew that there was a long doctor bill. But some time after, there were some very ragged pieces of rubber found in the fence corner, and Uncle John guessed that they were once his rubbers. Cloverdale.

GOOD HEALTH.

Cigarette Smoking.

A champion of the weed says: "The Cubans, who smoke all their lives, live as long as we do." To this statement there are several points to be made in demurrer. In the first place the Spanish race is constitutionally temperate. The cigarette is preferred because it contains less tobacco than the cigar. In the next place the cigarette smoked by the Cuban is not the cigarette of the cheap cigar shop. It is not made of sweepings adulterated with drugs, poisoned with "perique" and rolled up in paper which preserves the flavor of the chemicals used in the paper manufacture. "Perique," by the way, is a Louisiana product, in which is preserved and concentrated, by the method of curing, the most intense properties of nicotine. A pipe full of it, smoked by one not accustomed to this particular tobacco, would throw even an old smoker into a swoon. A little of it goes a great way. Genuine perique, or its drugged imitations, enters into the most popular and costly brands of cigarettes. Their effect is instantaneous until the habit becomes fixed, and then the effect is a chronic evil. Opium or even hasheesh may often be suspected. The Spanish epicure in cigarettes often, if not usually, rolls up his own. The deft performance of the operation is as much an accomplishment as the flitting of a lady's fan. The exquisite produces from his pocket a square bit of rice paper or corn husk, or paper of an approved manufacture. Delicately he doubles this and sifts into the fold a modicum of the best tobacco, clean and pure. With the skill of habit he finishes the cigarette, and turning it up at both ends, then produces his "machero," lights, puffs gently, and in a few minutes tosses the end away. He waits a long space before he takes another. And that is Spanish cigarette smoking, in which the paper or bulk envelope is scarcely moistened by the lips—not sucked as if the smoker would drain out the last drops. Some cigarettes may be considered an improvement on the heavy, strong cigar. The men who manufacture them for sale for home consumption conform to the delicate tastes of their customers. The cigarettes which fill our streets and houses with their noisome stench are things entirely of another sort. They are as bad as bad whiskey to pure brandy, which are not necessities of life any more than tobacco is. A decent respect for the proprieties of manhood might keep those who call themselves men from fraternizing with the dilapidated street urchins, who can outsmoke the tallest man on the street. And a proper regard for the duty of example should deter men from leading boys to create the fumes which resemble—King James in his "Counterblast," will tell you what.—*Philadelphia Ledger*.

TO REMOVE FRECKLES.—The following ointment was recommended by Dr. Heitzman and others at the late Greenwich-meeting of the American Dermatological Association, being an ointment recommended by Wertheim, of Vienna: White precipitate, subnitrate of bismuth, each one drachm; glycerine ointment, one ounce. This was to be applied in a thin layer every other night, and in from four to six weeks the result would be found to be highly satisfactory. Another remedy is given as follows: Horseradish grated into a cup of cold sour milk—let it stand 12 hours, then strain and apply two or three times a day—will, it is said, remove freckles from hands or face in a short time. Or, one ounce of lemon juice mixed with a quarter of a drachm of pulverized borax and half a drachm of sugar, will also remove them. Keep the lotion in a glass bottle, corked tightly a few days before using, and apply to the freckles occasionally, and they will soon disappear.

ANCIENT VIEWS ON TEMPERANCE.—Nearly a century ago Johnson said: The water-drinker glides tranquilly through life without much exhilaration or depression, and escapes many diseases to which he would otherwise be subject. The wine-drinker experiences short but vivid periods of rapture and long intervals of gloom. He is also more subject to disease. The balance of enjoyment, then, turns decidedly in favor of the water-drinker, leaving out his temporal prosperity and future anticipations, and the nearer we keep to his regime the happier we shall be. Here, however, as in all other things, there is a certain latitude within the range of health and happiness which the wise man and the philosopher will occasionally traverse round, but not exceed. The native fountain is in the center of this circle, and from it our eccentric divergences should be narrowly watched and carefully limited.

THE CAUSE OF INFECTIOUS DISEASES.—It is generally believed at the present time that the peculiar poisonous matters, the immediate cause of infectious diseases, are living germs or organisms, which are introduced into the body through the mouth or lungs. Consonant with this theory, it is accepted that these germs exist in nature; are always somewhere, awaiting, as it were, conditions favorable for their continued development. If this is believed, then it

follows that for each infectious disease there is a specific germ or poison which is capable of giving rise to that disease and no other. The germ theory has been established by facts in several diseases, and it seems highly probable that further investigation will yet prove that it is properly accepted for all infectious diseases.

DOMESTIC ECONOMY.

Washing Oilcloth.

To keep oilcloth looking nice it is essential that proper attention shall be given to the washing of it. Nothing will ruin it quicker than carelessness in this, and it will take but very few washings of this kind to do it. A good housewife is more careful of her oilcloth than of her best carpet, for the latter, not being in use as often, she knows does not require as much care; while the former, being in constant use, needs to be looked after very carefully, in order to have it present as good an appearance as possible. An oilcloth that has been neglected, aside from its not looking as well, will not last as long as the one that has been cared for carefully.

Too frequent washing, no matter how well it is done, will not improve oilcloth in the end. Usually this is the kind of treatment it receives, for few housewives seem to recognize the difference between a dusty oilcloth and a dirty one, and treat both the same. After it has had a thorough sweeping, if it looks dull and dusty, go over it, a little at a time, with a dry mop cloth, frequently shaking the cloth outside to relieve it of the dust collected in its work, and it will look as bright as though washed, and will wear a great deal longer. Frequent dustings of the oilcloth will save it many washings, and the housewife also some extra time and strength. A long-handled mop is just the thing for this work, for with its aid the floor can be gone over in one-half the time, or even less, than if done by hand, and look every bit as bright and clean.

Never use soap in the water when washing oilcloth; it is good for a great many things, but this is not one of them. It will, to be sure, remove any grease or dirt there may be; but with it, it will also remove the paint and fade the colors. An oilcloth that has been always washed in soap and water is easily discovered by its faded look. Ammonia should never be used in the water, which is one of the few things for which it cannot be recommended, although some women use it for this work. It may not injure the colors nor remove the paint, but it deadens the luster and gives to the cloth a dull, dead look. There are very few housewives that do not know that a brush should be used on oilcloth only on rare occasions, and that only a very soft one should be used then. When an oilcloth has been neglected, and by faulty washings or dryings the water or suds has been allowed to settle and dry between the rough surfaces, a brush is the only thing that will thoroughly remove it; but it should be a soft one and used as lightly as possible, but just enough scouring done to loosen and remove the sediment.

Use clean, warm water, or milk and water, which is much to be preferred when it can be conveniently obtained. With a clean flannel cloth wash as large a space as you can without doing much reaching. Have a dry cloth of flannel or coarse crash for a wiper, and after wiping as well as the wrung-out damp cloth will admit, go over it again with the dry cloth, being careful that no sediment is left in the corrugated surface, and wipe thoroughly dry. Go over the whole floor in this way, then let it stand until all the dampness has disappeared and it is perfectly dry. Warm some linseed oil, and with a flannel cloth apply it while yet warm to the oilcloth. The trouble with most housewives when using oil is that they use too much, when a little is all that is necessary. Rub a very little into the oilcloth, just enough to give it a nice gloss. If too much is used it will be worse than none, for the cloth will be sticky, and catch and keep every particle of dust touching it. If linseed oil is not convenient, kerosene will do very well, but even this should be used sparingly, or like the linseed it will do more harm than good.

In the country, skim-milk is often used for washing oilcloth, and is an excellent thing for this purpose, as it gives the cloth a beautiful gloss and dispenses with the use of oils altogether.

COLORING WHITEWASH FOR INTERIOR WALLS.

—Coloring matter may be stirred into white wash to make any desired shade. Spanish brown will make a red-pink, more or less deep according to quantity used. Finely pulverized common clay mixed with Spanish brown makes a reddish stone color. Chrome yellow for yellow color, and if small quantity is used, a cream. Use indigo for different shades of blue, and indigo and chrome yellow for green. Green pigments cannot be safely used with lime, as the lime will injure the color, and the green will cause the wash to peel off. For different shades of red, mix Venetian red and Spanish brown in various proportions. Lampblack will give a pretty gray if used in proper proportions with the whitewash.—*Atlanta, Ga., Southern Cultivator*.

The Week.

Rains have continued at intervals and locally since our last issue, but the precipitation on the whole has been light, though in many places sufficient for present uses. Indications are for a recurrence of the storm, and the general outlook has revived confidence in all lines of trade and production. Our Northern friends in Oregon and Washington Territory report the prospect of a hard, long winter, and the stock-growers congratulate themselves on the storage of abundance of provender for their animals. What they call a hard winter will mean for us a wet winter, as we get in this State what the Northern folk have left over in the way of weather. Such a prospect is especially pleasing after the 2½ years we have passed through.

Arrangements are complete for the celebration of the railroad wedding of California and Oregon, as is stated elsewhere. The event will be of notable historical importance, and many will no doubt be eager to participate.

Congress is in session again, and we give elsewhere a few paragraphs from the President's message. His anti-protection doctrine will not please the wool and fruit and wine interests of the Pacific Coast. It looks much as though the tariff would rise as a leading political issue which will make a sort of a geographical fight, as

the tariff is in the main a question of local producing interests. The President certainly has "the courage of his convictions," and probably knows that he will have to encounter the most earnest and organized opposition thereto. What the message says about the menace to national prosperity through the gigantic aggregations of power and capital called "trusts" will command the approval of all good citizens.

Land Tenure.

Let us make a diary of land tenure! Let us set out how it began and how it grew to its present condition. The past may enable us to understand the present and more intelligently divine the future.

We may divide the history of the world into ages and mark the successive steps by figures. The figures will not indicate any precise time in history, but only the condition of the people in that nation, tribe or locality.

1. Utter savages, and only two or three to a township of 36 square miles—mere ramblers, with neither name nor local habitation. Land possessed only as they stood upon it, and left without an intention to return. No land tenure here, no ownership.

2. Population increased to one or two to a square mile in places. Certain spots desirable for fish and game, claimed, fought for and lines formed. It was done after the manner of Abraham and Lot. A line was made between two hills or two trees; and it was said, let this be the line between thee and me, thy hunters and mine. Still there was no ownership of the soil, but only a forbidden line.

3. We may suppose that other families on other sides would tie Lot and Abraham up in the same way. These lines, when all the sides were filled, would include a space which the head of the family could begin to map out in his mind and call his.

4. The cattle-keepers, with sheep, goats and swine, horses or camels, became 8 or 10 to the square mile. They lived on smaller areas and became attached to still waters, rich pasturage, and made local homes. The land touched them more nearly, because it was more immediately useful. They could define its bounds by visible objects close at hand, and a sort of sense of ownership sprang up. "This is mine!" was first heard, and why not? The young man took his wife, his flocks and herds and journeying till he came to a choice place, he found no owner, no one to say nay. Henry George was not there, so he pitched his tent and made his home. Had he been the most conscientious follower of the modern prophet George, he knew not how many people there were in the world, or how many acres there were, or whether he held more than his share or not. He got no deed, patent or papers. He had no consent of any one. Indeed, there was no one with a right to consent. If a stronger family came along and drove him away, he sought another place, that was all.

5. Then came the farmers, the planters of groves, orchards, gardens and fields. They lived 20 to 50 to a square mile. They fenced and built houses. The land took a new value, and became indeed a private property. It was measured and bounded. It was bought and sold; yet, perhaps, a mere giving of possession was all the title had. All was held by law a year. It was all force. He who would not fight could hold nothing in those days, and the stout robber took house, land, wife, family, and slaves when he made a conquest.

6. As the best locations were occupied, the rich harvests invited marauders, who were still hunters or herders, and men of war, and found themselves hedged in by these inclosures, and enticed by what they contained. They came singly or in bands. The farmers united against them. They made common cause against these barbarians. They elected captains. They built strongholds, or castles, to flee to for safety. They laid up stores there, that when bands of savages came they could make war upon them with their families in safety. Often the domain was desolated by fire and sword. The foe subdued or fled, each Granger betook himself to his own home and began life anew. But the lines were all down. They had disputes. Then the captain became a judge. He heard the evidence, fixed the lines, and gave papers and landmarks for a perpetual memorial. New settlers came to him, got his consent, paid a fee for the trouble, made his home, and became

one of the compact. In this way the captain became the feudal lord. He declared himself the landgrave or owner, and all the rest renters or vassals. So easily do men placed in power magnify their offices and assume even a crown.

7. Then came the conqueror. He might lead a savage tribe or be the feudal lord of the next valley. He overran the farms. He took the castle. He assumed to be the lord. He increased the rents or dues, and enriched himself at the expense of the farmers. And he did not hesitate to declare that all the land was his, because he had conquered it. Nay, very often he would kill the farmers and put his followers in their places. Thus did the Romans everywhere. Thus did Charlemagne in France. He gave the Kingdom of Rome to the Pope, and this title he claims to-day. Thus did William the Conqueror in England. Thus did the English in Ireland. The English landlords there have this title, and no more. When the English black prince entered France, he took castles and placed his captains in them, to hold castle and estate, by mere conquest. It was a good title if they could hold it. No one in those days had any better. The burly villain who did not scruple at murder, became a lord, if not a king.

8. This age of murder passed away. The great kings appeared in France, Germany, Spain and England. Laws were made and written. Parliaments were called. Records were made, and metes and bounds, heritages and successions, fixed. There must be a purchase or heirship. These robbers managed to make vested rights of their claims, hereditary ever. Fighting for land was at an end. Unless born to it, you must buy or rent forever. Thus Europe took shape, with nine-tenths of the soil the property of great nobles, so-called, the heirs of the war chiefs.

9. The United States were settled under these ideas. The kings of England, and other powers, gave mere paper titles, often from the Atlantic to the Pacific, to leading men. These grants have given a world of trouble to the republic and to many of our States. The patents were so framed that it was difficult to say what they did not include; and the owners always claimed a very broad construction. The State of New York was convulsed, almost to revolution at times, on account of these extravagant and dangerous claims. Happily the people found means to demolish them all at last.

10. The American land system was in some sort an offshoot of the English, but yet much modified to meet the requirements of the republic. Land does not go to the eldest male heir, but by will, or by a regular law of partition, made by each State. The great wilderness came to the possession of the Government, and it devised a land system by which it was to pass to the settler, in small quantities only, at a small price. This was the decree of the whole people. It had the common consent, we may say, of all mankind or of all who had a right to consent.

It is true that of late years some large grants have been made, and the lands have fallen into the hands of alien holders. As to these, some legislation will be had to restrict and return to the people. But as to all the rest, no man who holds only a fair share need ever fear that the people of the United States will go back on themselves and disturb his quiet possession. Even on Mr. George's own showing, each one might fairly claim such a share, because he leaves the same to all the rest.

Then we are pledged to this, that all laws shall be just and equal, and if any new land theory is to be accepted, all who are disturbed will be fully compensated out of the public purse. We cannot do less, as the scheme was of our own invention.

DEATH OF G. W. COWLES.—Many of our readers will hear with regret of the death of G. W. Cowles of San Diego. Mr. Cowles was known in his own county for his activity in a number of important local enterprises, but throughout the State he has won a name for his devotion to the raisin industry, and his product from his ranch in El Cajon valley has achieved prominence as one of the best in the State. He began in El Cajon ten years ago, and at the time of his death he owned 4000 acres on which he had fine fruit plantations and herds of horses and cattle. Mr. Cowles was but 52 years old at his death, and his demise was a great shock to the community.

A Demand for Honest Lard.

The dairymen have secured a law against putting lard into butter without telling the purchaser, and now the honest lard men call upon Congress to make similar provision that debasing substances be kept out of lard. Dietetic reformers have long tilted their lances against the lard barrel, proclaiming even honest lard the cause of many of the ills which flesh is heir to. How their ire will rise at the thought that even commercial lard is unspeakably worse than they have dared to paint it.

Be it known, then, that the Butchers' National Protective Association, with a membership of 10,000, representing the live-stock breeders, the butchers and retail dealers of the country in the pure live-stock product, duly convened in second annual session in the city of Chicago, by resolution, determined to present this matter to the attention of Congress, asking that a law be enacted, similar in effect to the Oleomargarine Act, levying a special tax on all manufacturers of and dealers in adulterated lard, compelling a specific name to be given to the article so manufactured and adulterated, and requiring the labeling and marking of this manufactured product in such a manner, by such a device and under such a name, that the consumer will not be deceived in the article purchased.

And what can there be in lard worse than the qualities which the hog puts into it? Much every way, for the powerful association which we have described above declares to Congress that the evil which they would do away has become so wide-spread that the great product known in commerce as lard has for some time past been, and is now, so counterfeited and adulterated that the consumer rarely, if ever, is able to procure the pure article. The ingredients used in this counterfeit are of such a cheap and inferior grade that they have practically driven pure lard from the market.

What can be the debasing materials which deceive even the great American pie and doughnut expert—experts in those lines than which the world cannot furnish better? The manifesto to Congress declares that the use of vegetable and mineral oil, often of a deleterious nature, compounded with other ingredients, such as starch, caustic lime, alum, carbonate of potash, salt, potatoes, potato flour, chalk, plaster of Paris, baryta, cotton-seed oil and sesame oil, and various other articles, ingredients, mixtures and compounds, has produced an article sold and bartered in commerce under the name and appellation of lard, so nearly like the pure article in appearance that few save experts can distinguish the difference.

This is indeed alarming, as indeed are the facts wherever we look in the line of food adulteration. We are of the opinion that the United States Government has perhaps its greatest future work in such enactments as will secure to the people honest materials in the nation's food, drinks and medicines. In the matter of lard it is claimed that annual production in the United States is now estimated at 600,000,000 pounds, of which more than 35 per cent is an adulteration. The 60,000,000 people of the United States are thus compelled to pay for a counterfeit and adulterated article, which they are led to believe is the pure, unadulterated rendered fat of the hog.

Congress should listen to the lard men. As they are prohibited from putting their product into butter, they should be protected from the host of despoilers which prey upon them. The American hog has a hard time of it on the whole at home and abroad. Congress should see to it that his rich juices should not receive injections from the petroleum barrel or from other base sources. Congress should give the lard tub a chance to stand squarely on its own bottom.

FRESNO RAISINS.—The first trainload of California raisins, borne in 20 cars and valued at \$45,000, reached New York last Monday, and the second was expected to arrive on Friday of this week. Another (the fourth) raisin train of 15 cars, shipped by Geo. W. Meade & Co., left Fresno on the 5th, making 75 carloads direct to New York, besides 35 carloads shipped one or two cars at a time. Meade will yet ship 25 carloads to different points, which will close the season's pack.

CANADA is now furnishing more sheep for the Boston market than any State in the Union.

Notes on Pacific Coast Seedling Fruits.

[No. I.]

(By EDWARD J. WICKSON, Berkeley, Cal.)

[NOTE.—During the preparation of my book, "The California Fruit-Grower," which is now approaching completion, I have been collecting information concerning the origin and value of California seedling fruits, with the idea of presenting as good a list as possible in the book. For the purpose of correction, and to elicit further information, my notes were presented in part at the last meeting of the State Horticultural Society, and are now offered to the readers of the RURAL PRESS, with the same end in view. The matter as presented below is not at all in the form which I expect it will permanently assume, and I invite the fullest correction of the notes given and information of all other seedlings which are entitled to entry in the lists. I shall esteem it a special favor to have correspondence with any reader who takes an interest in the subject.—E. J. W.]

Seedlings at our State Fairs since 1856.

It will be interesting as an introduction to the subject to run over hastily the records of seedlings brought forward at our State Fairs. I shall be very glad to have the subsequent history of any seedling which is included in any of the exhibits mentioned, and hope any who can trace down any of the premium seedlings of the early time will do it:

The committee on fruit awards for the Fair of 1856 in their report* note the multitude of seedlings which are brought forward, and urge that at least three years bearing of a seedling be closely observed before the variety is proclaimed as valuable. There had evidently been disappointment in purchasing seedlings after their first year's fruiting, and when the trees "had been stimulated by every means that science could dictate or ingenuity invent." They suggest that all seedlings shall be exhibited for three successive years, and be examined each year by a competent pomological committee, and the several examinations carefully and accurately compared before the seedling receive the indorsement and sanction of the Society. They report upon three seedling peaches:

First—A seedling cling grown on dry ground without irrigation by John S. French of Santa Clara; size, 6½ by 7 inches in circumference; deep yellow, slightly oblate, with small projecting apex, and suture indistinct: flesh bright orange, uniform, very firm, crisp, but little acid and slightly astringent, ripening very late, probably Oct. 20 to Nov. 1. This was pronounced worthy of cultivation.

Second—Two clings by Major S. J. Hensley of San Jose, first 9½ by 8½ inches, white, roundish, white flesh, red at the pit, juicy, sweet: middle to end of October; second: 9 by 9 inches, light orange color, globular, flesh bright orange, very rich and excellent: last of October. For these peaches a premium of \$25 was awarded.

Third—Lot of freestones by A. P. Smith of Sacramento, 7½ by 8 inches, globular, deep orange color, flesh soft, juicy and melting, with very rich apricot flavor: first to middle of October.

The Society awarded a prize of \$25 for the seedlings of Major Hensley and premiums of \$10 each for the seedlings of Messrs. French and Smith, so that all the seedlings shown were honored with awards.

The Committee of the Fair of 1856 favorably mention a seedling-apple by J. C. Yount of Napa, "12 by 12½ inches in circumference, oblate, angular, skin smooth, pale yellow striped with red, flesh yellowish-white, flavor generally good, altogether worthy of attention."

At the place of J. Cook on the Alameda, San Jose, some very "fine seedling peaches" were noted by the Visiting Committee of the Agricultural Society in 1856. This committee also saw at the place of A. H. Meyers in Alameda "a seedling-peach which promises to be one of the very best varieties." This peach is mentioned in the annual address before the fair of 1853 as "Meyers' Rare-ripe—perhaps the best peach in California."† This variety is mentioned as free from curl in San Joaquin county in the statement of West & Brother to the State Agricultural Society in 1861.‡ [At the meeting of the State Horticultural Society November, 1887, Dr. Gibbons said the variety was still to be seen about Alameda, but it was now subject to curl. James Shinn said it had ceased to be of value. Being of the serrate glandless class, it suffered from mildew and general debility.—W.]

At the fair of 1857 a premium was awarded to A. P. Smith of Sacramento for the best seedling-nectarines.

At the 2 ranch in Ione valley, Amador county, the committee found Col. Alex. Bolton with 50 seedling peach trees, "of several fine varieties." At Wolfskill's place in Los Angeles they note some seedling peaches of fine size and flavor which well deserve to be added to the catalogue of cultivated varieties. Mr. Cardwell also had seedling peaches and nectarines "of many fine varieties."

At the fair of 1858 premiums were awarded for seedling peaches to G. W. Henshaw of Butte county, O. Covillard of Yuba county and G. W. Brooks of Butte county, but no name or description of the fruit is given. The "visiting committee" of that year found, however, at the farm of Major P. B. Reading, 22 miles from Red Bluff, a seedling freestone peach of excellent quality, ripening November 1st and keeping two weeks; another freestone ripening in August, having the deep blood-red appearance of the Indian cling and of much more delicious flavor. Major Reading had at that time

fructed over 600 seedling peaches, and considered himself repaid for all his outlay by securing the variety first-named, ripening in November. They also found at Major Reading's a "seedling fig of uncommon size."

At the fair of 1859 a special premium was awarded to Frank Keller of Butte City, who exhibited a collection of 21 seedling grapes from vines which he secured by planting the seed of the Los Angeles grape in 1853. The committee declared that Mr. Keller was on the "right track for originating varieties of the grape that may prove of value to California." At the same time George R. Moore of Sacramento showed a cane of a seedling of the Black Hamburg eight feet long and bearing over 50 bunches of grapes, which could not be distinguished from the parent variety.

At the fair of 1859 J. J. Swart of Sacramento is credited with yellow seedling peaches, "which compared in size and good appearance with any peaches on exhibition, and the same, shown again in 1860, were said to "bid fair to take a prominent place."

The report for 1859§ has an account of the Merrill Seedling apple, large, irregular oblate, greenish yellow, striped and mottled with red, flesh, greenish white, brittle, lively and juicy, sub-acid with rich, vinous flavor; ripens August 20th to September 1st. Originated with J. Merrill of Sacramento county, and pronounced by the Examining Committee to be "a good summer variety, early, and of an agreeable flavor."

At the fair of 1860, J. H. Nickerson of Placer county exhibited a white-grape seedling from the "California grape," which he named "Malvina," and which is described as "giving promise of becoming a desirable wine grape, having a sharp, pungent flavor." (Rep. 1860, p. 315.)

The report for 1860 mentions a nameless seedling apple by S. C. Tyler "of pleasant, sub-acid flavor, moderate size and said to be a good keeper."

In 1860, also, the committee recognized a large number of seedlings by different growers, "some of them beautiful and highly flavored."

At the fair of 1861, the award for the best seedling peaches was made to Dr. Bateman of Stockton.

A seedling almond by W. P. Miller of Stockton is mentioned in the statement of West & Bro. in 1861 as having borne three crops and as being of undoubted value. This variety received the premium for the best soft-shell almonds at the State Fair of 1861. (Rep. 1861, p. 324.)

For ten years or more following 1860, the plan of securing carefully written reports from fruit committees seems to have been abandoned. This is unfortunate, because we find no comments whatever upon the hosts of seedlings which must have been brought forward during that period. The early idea of testing seedlings for three successive years, and then formulating a report upon the results, was never carried into effect. The changes in administration of State societies, and consequent change in policy, is certainly unfortunate when the change is for the worse, as in the case of exhibition and trial of seedling fruits.

At the State Fair of 1872 E. Dane of Sonora showed three varieties seedling plums, but there is no report of their character. He also showed five varieties seedling pears, but there is no judgment of value recorded. An exhibit of three varieties seedling pears by T. K. Stewart of Sacramento also stands without comment.

In 1872 Robert Williamson showed 11 varieties seedling apples, and for these and other seedling fruits already noted, he received a premium, but no account is given of the varieties, nor were they named.

At the State Fair of 1872 there was a notable display of seedling peaches. E. Dane of Sonora showed 19 seedlings and won a special premium, but there are no comments or descriptions of the fruit. Robert Williamson of Sacramento showed three seedlings, named, "Orange Free," "Accident," and "George's Late," and the next year Mr. Williamson showed also "Smith's Late Cling," a seedling.

At the State Fair of 1873 there were at least seven seedling peaches shown by different growers, but there is no record of their quality. The following year Ira S. Bamber of Placerville exhibited 18 varieties seedling peaches, and G. R. Grant of Roseville, one variety, a cling-stone. [At the Horticultural Society meeting, November, 1887, Senator Buck said this was the first appearance of the peach now known as the "Roseville Cling." He saw them at the fair and was so favorably impressed that he began to grow them. It is very prolific; a large, smooth, round peach, a little red at the pit. Mr. Hatch said it is a first-class white peach. The red at the pit is hardly observable. It is better than McKevitt because bruises on it do not show, hence it ships well. It does not curl at Vacaville. Mr. Coates remarked that in some places the Roseville Cling would curl so as to lose its crop, while the McKevitt was not injured.—W.]

In 1874 W. S. Manlove of Brighton showed a seedling apple unnamed.

In 1875 Mr. Robert Williamson showed two varieties seedling peaches and four varieties seedling apples, and won a prize for a display of seedling fruits, and in 1876 did the same thing again. In 1877 he showed 16 varieties seedling fruit and won the prize again.

In 1878 there were four entries for the seedling fruit award: D. C. Young, Sonoma

county, I. S. Bamber, El Dorado county, Mrs. R. Blacow, Alameda county, and E. M. Smith, Coloma. The prize was given to Mrs. Blacow. At the same fair Mrs. R. K. Wick of Sacramento showed what is called the "October seedling peach."

In 1879 Mr. Williamson entered the lists again with his seedling collection, and wins the prize over two competitors, one of them being Mr. Bamber. The record does not even say how many varieties were shown. The next year Mr. Bamber, who had been vanquished by Mr. Williamson for two years, seems to have become aroused, for he came down from the mountains with 28 varieties of seedlings, and laid out the valley champion, for Mr. Bamber took the prize, and the committee gave Mr. Williamson an anodyne in the form of a recommendation for a special premium.

In 1880 Mr. Williamson returned to the front and won the general seedling prize and the gold medal for general fruit display. A new exhibitor, however, appeared in the form of L. Rosier of Placerville, who showed the "Wilcox cling" and "Tripp's seedling" peaches. No comments are made on these varieties.

In 1881 no entries of seedlings were made, but Mr. Williamson pocketed another gold medal on the general fruit display. In that year Thomas Hardie and I. S. Bamber captured seedling premiums at the Placerville fair, and G. R. Hinde at Los Angeles.

In 1882 and 1883, no entries of seedlings.

In 1884 the interest in exhibiting seedlings seems to have revived. In peaches, J. H. Carrington of Sacramento showed a white cling-stone. C. R. Harlow of Auburn showed "Leak's Seedling" and "Thompson's Freestones," but won neither award nor compliment. Also, in 1884, A. D. Miller of Walsh Station showed Miller's Seedling and a general display of seedling apples, but no award was made.

In 1885 and 1886 there was no distinctive mention of seedling fruits, though some were shown.

Thus I have made a running review of 30 years' history of our State Agricultural Society, with a view to discover what has been done to advance the development of California fruit varieties. The conclusion must be that 30 years ago the work was taken up wisely and energetically. If the provision of 1856 had been carried out, that all seedlings should be examined and reported upon for three years consecutively and then described and named, we should have a record and history of seedlings which would be of great value, and every originator of varieties would have been eager to submit his fruit to such a cautious and scrutinizing tribunal. But this proposition was never carried into effect. The awards made afterward for displays of seedlings, unaccompanied by any critical estimate of value, were of comparatively little account. It is not too late for the State Society to return now to the ground marked out by the pioneers of 30 years ago, not only in reference to seedlings, but in awarding prizes for best exhibits of named varieties in display and in single plates. As the fairs are now, the fruit exhibit is merely a heterogeneous mass of fruit, varieties duplicated without limit merely for display, and hardly one sample in 50 named correctly, if named at all. It is high time we brought our horticultural displays upon a more scientific and more useful basis. At present there are "boom agencies" and in no sense pomological displays. No doubt the State Board of Agriculture would listen with pleasure to any suggestions which this society might make looking to a practical reform in this respect.

Apples.

In turning now from the records of the State Fairs to other sources of information, I shall present the seedling fruits, of which I have information, each class of fruit by itself. Concerning all these fruits I wish to know where they succeed and where they are considered of little account, as well as historical data enough to place each valuable seedling properly upon record:

Skinner's Seedling.—Name approved by Cal. State Hort. Soc. Nov., 1887. Synonyms: Skinner's Pippin: Santa Clara King. Originated with Judge H. C. Skinner on bank of Coyote, east of San Jose, and tree reported still standing in 1879. Recommended by B. S. Fox at Convention of Fruit-Growers, held in S. F. Sept. 8, 1859, and adopted for trial. Described by Com. of New Fruits American Pomological Society 1877 (p. 46) as follows:

Santa Clara King: Fruit large to very large; form, oblate, conic, slightly mixed: color, rich lemon yellow, faintly striped with bright red: flesh, yellowish white, very tender, juicy, sprightly mild sub-acid: quality, best. Season, September and October. This is the best very large apple we have seen. Said to be a good grower and productive.

Recommended by Southern California Nurserymen's Association for family use in 1886. Other descriptions as follows:

Skinner's Pippin: Considered here one of the best early fall varieties. Fruit, large, oblong; skin, thin, pale yellow, often with blush next the sun: flesh, very tender, juicy, sub-acid flavor: tree, a vigorous grower. September.—*John Rock's Cat.*, 1886.

Skinner's Seedling: Large, yellow, very tender, good flavor. Tree grows well, and comes early into bearing.—*Shinn's Catalogue*, 1885.

Santa Clara King: Large, roundish: skin, yellow, with red blush on exposed side: flesh, crisp and juicy: good for all purposes; ripens Aug. 10 to 20.—*W. R. Strong & Co's Cat.*, 1887.

Cook's Seedling (Name approved by C. S. H.

S. Nov., 1887.) Synonym: Sonoma Seedling. Brought to notice by O. B. Shaw of Sonoma, who sent specimens to the RURAL PRESS in January, 1872. Described in that paper January 27th as a seedling raised by Mr. David Cook from the seed of the Juneating: Above medium size, pale yellow striped with red, sharp acid flavor. Not decidedly rich, but flavor full and acceptable. Excellent keeping qualities.

Described by B. S. Fox (RURAL PRESS Dec. 29, 1887,) as "of the Esopus Spitzenburg class, with a little variation, and is a good, tart apple, just what is wanted at this season, when so many varieties get sweet and mealy. For market purposes, it is a good, firm, high-colored apple and well worth propagating, for all high-colored apples have a preference."

Other descriptions as follows.

Cook's Seedling promises well as a first-class winter apple. Size medium to large, striped and marbled with red on a yellow ground.—*John Rock's Cat.*, 1886.

Large, yellow striped with red; one of the best winter apples.—*Luther Burbank's Cat.*, 1886.

One of our best, keeps well, large, striped, rich flavor.—*Leonard Coates' Cat.*, 1886.

Pronounced superior to the Yellow Newtown pippin in the Napa valley, by Prof. W. C. Damon of Napa, in a letter to the RURAL PRESS Sept. 20, 1879.

I have an impression that this apple has been found unsatisfactory in some localities. Who will give experience of that kind?

Marshall's Red.—(Name approved by C. S. H. S., Nov., 1887.) Synonyms: Red Bellflower, Marshall's Seedling. Originated with J. L. Marshall, Browns Valley, near Napa, from seeds of Yellow Bellefleur, the branches of which interlaced with those of a Red June tree, and the seedling is presumably a chance hybrid between these two varieties. Fruited first about 1877, and generally introduced by Leonard Coates in 1884. The tree resembles Red June in habit of growth; fruit large, same shape as Yellow Bellefleur, but of same color as Red June; quality, very good; flesh, firm and fine-grained; aromatic, and slightly more acid than the Yellow Bellefleur; tree, a very heavy bearer, and the fruit ripens in October. Samples were shown at Horticultural Society meeting in San Francisco, and described by W. W. Smith as a committee, as follows:

A very large, deep rich-red apple—the red extending all over the apple, and covered all over with small whitish dots resembling those of a strawberry. A very beautiful apple.

Mentioned by Dr. Strentzel in his report to American Pomological Society in 1883, as likely to prove the best seedling apple originated in California.—*Report 1883*, page 138.

Beauty of Alameda.—(Named by C. S. H. S., Dec., 1882.) A red apple shown by the late W. H. Jessup of Haywards. Tree from seed planted by W. C. Blackwood. Color deep red, shape like Bellefleur, and averaging about the same size, very firm, mild acid, rich.

Steele's Red.—Shown at meeting of State Horticultural Society, Jan. 26, 1883, by J. M. Hixson. Said to have originated on a place owned by Mr. Newell, Granite Hill, El Dorado county. Color clear, bright red, size uniform, good keeper. Has been propagated considerably in El Dorado county, and known as Steele's red. Mr. Hixson conjectured that it was a seedling from Winesap or Baldwin. "Steele's Red," mentioned as a synonym for Winesap, by L. M. Davis of Mud Springs, El Dorado county, in his report to Hort. Society in 1880. I should like to know more about this apple.

Clyman's Pippin.—Originated in Green valley, Sonoma county, from seed brought from Oregon by Lancaster Clyman early in the fifties. He fruited a large lot of seedlings and two of them were propagated and distributed by W. H. Pepper of Petaluma and others. These two were shown at the first county fair in Santa Rosa some years ago, and one was named Clyman's Pippin and the other Clyman's Russet, although it showed no russet except a little at the stem. Mr. Pepper has the latter in bearing and calls it the "Clyman."

Clyman's Pippin, grown by A. B. Provines of Cozzens, Sonoma, was shown at Santa Rosa Convention, 1887, from trees furnished him by Mr. Smyth of Santa Rosa, who calls it "Orange pippin" or "Clyman's Seedling," and says it is supposed to be a seedling of Yellow Newtown pippin, a better keeper, and when ready for market very yellow.

I showed a sample of Mr. Provines' apples at November meeting of State Horticultural Society in comparison with both of the Clyman apples brought by Mr. Pepper, and it was evident that the variety they are growing in the upper part of the county as the Clyman Pippin is the one known in Mr. Pepper's neighborhood as "Clyman's Russet" or the "Clyman." This matter should be straightened out.

Calistoga.—An apple sent to be named by the State Horticultural Society by Samuel Kellett in March, 1883. Said to have been found in a garden in Calistoga. Pronounced by a committee to be well worth preserving, fine color, flavor and a good keeper. No fuller description is given. Apple named "Calistoga." At Horticultural Society meeting November, 1887, W. W. Smith said he had kept the Calistoga until June, and considered it valuable on this account, if not otherwise.

Sexton's Golden Seedling.—Originated with Joseph Sexton of Goleta, Santa Barbara county, and described by him in RURAL PRESS, Nov., 1883, as follows: A large golden fruit with a little blush on one side; inclined to be flat rather than long; with a thin skin and full eye; stem strong in medium cavity; flesh in-

*Cal. Agr. Rep. 1856, p. 36.

‡Rep. 1859, p. 397.

§The same, p. 220.

§The same, p. 259.

clined to be battery, and a sprightly acid flavor; fine table or cooking apple; a fall apple. Commented upon by S. P. Snow of Santa Barbara, in a letter to *RURAL PRESS*, Dec. 1, 1883, as follows: Sexton Seedling is the handsomest apple I raise, good size, good bearer; ripe in September, exceedingly tart, and one of the best cooking apples I ever saw.

Lucy's Red Cheek.—A fall apple originating with Joseph Sexton, Goleta, Santa Barbara county, described by him in *RURAL PRESS*, Nov. 17, 1883, as follows: Fruit medium; roundish, somewhat flattened; skin with a ground of pale, greenish yellow mixed with faint streaks of pale red on shady side, with a bright red cheek; calyx small and set in shallow, rather narrow basin; flesh white, tender, juicy, with a slight perfume.

Violet.—Originated with J. W. Violet of Ione. One of the largest apples known, averaging nearly as large as Gloria Mundi; conical shape, a beautiful red nearly all over; solid, firm and crisp, good flavor, fine shipper—September to January. Tree strong grower, with upright habit; bark on new wood smooth, glossy and light chestnut color; leaves quite peculiar—a rich, glossy green.—*W. R. Strong & Co.'s Cat.*, 1887.

Merkeley's Red.—Originated on farm of R. W. Merkeley, near Sacramento. Fruit large size, dark red, excellent flavor, crisp and juicy—a superior market variety.—*W. R. Strong & Co.'s Cat.*, 1887.

Excelsior.—Originated with O. N. Cadwell of Carpinteria, Santa Barbara county. Shown at Los Angeles Horticultural Fair, 1879. Pale yellow in the shade and in the sun wholly red, light red streaked with claret; four inches in horizontal diameter; oblate, base and apex deeply depressed; flavor good, fine for table and does well; ripens—?

Unnamed.—Originated with O. N. Cadwell; large, oblong, tapering like the Yellow Belle-fleur; dark red, skin rather unhandsome, flesh very tender and juicy; flavor peculiar, but pleasant; ripens—?

Esopus Spitzenburg Seedling.—At the meeting of the State Horticultural Society, April 3, 1880, Milton Thomas of Los Angeles showed a seedling from the Esopus Spitzenburg which he found a heavy bearer and excellent keeping apple, lasting until April or May.

Red Edwards.—Shown by James Shinn at State Horticultural meeting, Feb., 1883. From Cloverdale. Pure red, excellent quality. Is it a California seedling?

Unnamed.—A red apple. Tree purchased at nursery near S. F. for Red Astracan by S. Bristol of Ventura county. Larger than Red Astracan, more glossy, and brighter color, form flatter, does not become mealy, six weeks later: tree spreading and not compact, and a great bearer. Pronounced by B. S. Fox a "seedling of some variety not known to him." Said by S. F. fruit merchants to be unlike anything they had ever sold.—*Rural Press*, Dec. 8, 1877.

Unnamed.—Seedling by Mr. P. Welch of Aptos, large, light green nearly white, rich sub-acid, and superior for cooking; keeps well for a summer apple and bears handling well. Ripens midsummer. Reported by F. E. Owen in *RURAL PRESS*, March 21, 1885.

Gibbons' Seedling.—Originated in the garden of Dr. W. P. Gibbons, Alameda. Medium sized, light-colored apple with crisp flesh and agreeable flavor. Form quite variable. Chief claim was made on the exceeding productiveness of the tree. Three fruit spurs bore nine apples, all medium size. In November, 1885, the State Horticultural Society committee reported this apple as of good flavor, tender and juicy and as of passable value to the amateur, but too small and not ripening at the right season for the orchardist.

Cowles' Seedling.—Shown at Horticultural Society meeting, October, 1887, and reported upon by a committee as probably a seedling of the Red June. Described by the grower, T. Cowles of Watsonville, as a heavy, constant bearer, ripening two weeks later than the Red June.

Mock's Late Keeper.—Mentioned as one of the best winter apples by L. M. Davis of Mud Springs, El Dorado county, in report to Horticultural Society in 1880. Listed in *W. R. Strong & Co.'s cat.* Is it a Cal. seedling?

Other Fruits

Will be taken up as space permits, and the subject will be taken up again at meeting of State Horticultural Society on Dec. 30th. In writing about seedlings, please give season of ripening by month, and as compared with common standard varieties.

A ROYAL STOCKMAN.—The Prince of Wales is, naturally enough, deeply interested in "the roast beef of Old England." A dispatch to the *World* speaks of a coming new edition of the Sandringham catalogue of Shorthorns. His Royal Highness now owns upward of 150 head, which are divided into two herds, those of the Bates breed being kept at Babinely farm, while the Booth tribe are at Wolverton, nearer the Hall. The climate and soil of West Norfolk appear to be salubrious for Shorthorns, for they are healthy and breed freely, while there are cows aged 15, 13 and 12 years.

The Christmas number of *Scribner's Magazine* will contain double the usual number of illustrations, every one of which has been made from a drawing by some well-known and expert artist.

On the Coast of San Mateo County.

EDITORS PRESS:—It was with some reluctance that your correspondent turned his back upon the charming rural scenes of Woodside, where he was so pleasantly entertained at the residence of Mr. John Winkler, on the night of the 18th inst., but a sense of duty in the interest of your journal impelled him to take leave early on the following morning. Following down the Palarcitos creek several miles, I observed many orchards and vineyards, which gave evidence of skillful culture and bountiful returns for the outlay, though planted at but comparatively recent date. Finally, when within six miles of Half Moon Bay, more familiarly known as Spanish Town, I cross a low range of mountains and drop into a beautiful fertile valley, and am soon in the midst of a population of about 900 people. Half Moon Bay has an ancient appearance, many of the buildings being moss-grown with age.

The inhabitants anxiously yearn for railway connection with San Francisco, and are confident that such an accomplishment is all that is required to make it one of the most prosperous communities in the State. The soil is extremely fertile, and the climate, barring occasional fog, is most inviting, and there is no doubt that with an outlet by rail communication, many would seek homes here in preference to places they now occupy. At present, the hopes of the people are encouraged with the promise of a coast wagon-road, by which the distance to your city will be reduced from 34 to only 18 miles.

On Saturday night I drove six miles up the Half Moon Bay, and stopped over Sunday with Mr. J. F. Weinkie, proprietor of the Moss Beach House. Here we found good treatment, and readily became convinced that the place has many attractions for those seeking rest and recreation from the bustling scenes incident to city life. Opportunities for bathing, boating, and fishing are scarcely excelled anywhere, and guests may rest assured that the proprietor will spare no pains to make them comfortable at most reasonable rates.

Contrary to expectation, based upon information regarding the inhabitants of Half Moon Bay, many of whom are of foreign birth and uneducated in our language, I succeeded in extending the circulation of the *PRESS* considerably. Among those worthy of special mention on account of their enterprise and public spirit the names of R. J. Knapp, manufacturer of the premium side-hill plow; Levy Bros., merchants; Wm. Pringle, harness-maker, as well as others whose names we cannot now recall, are conspicuous.

On Tuesday morning following we proceeded along the coast, passing through a beautiful district of productive farming lands, extending from the water's edge to the mountain tops, much more of which was cultivated in former years than at present. In earlier times the certainty of crops regardless of rainfall along the coast, together with the high prices of grain, was an incentive for the cultivation of extensive tracts to grain. Now all is changed. Other sections of the State, though far less productive and certain for crops, have on account of railroad connection with the outside world superseded this region in the grain-raising industry, and the country is now devoted principally to the dairy business.

Six miles down the coast I arrive at Purisima, a small village, though graced with a few good residences, among which is that of Henry Dobble, and a creditable school building. Further on we pass the thrifty farms of Andrew Osterman, John Schleefer, and at noon we accept the hospitalities of H. Frie and family. Mr. Frie here owns a good farm of over 300 acres well improved and stocked with fine cattle, horses and hogs. He shows a colt, McLellan stock, but two years old, which measures 16 hands and weighs over 1000 pounds. Proceeding along the coast, the first raindrops of the season commenced to fall, and I concluded to raise the top of my buggy. Soon after doing so all indications of rain vanished. Notwithstanding that less rain is required along the coast than inland, it would prove a most welcome visitor. Dairymen are compelled to depend upon hay, pumpkins and beets principally to maintain their herds until new grass comes, which cannot grow without rain.

Passing up San Gregorio creek five miles, I halt in front of J. W. Bell's residence and pass a pleasant night with the proprietor and his kind companion. Mr. Bell has an excellent farm here—very productive—but he finds dairying more profitable than any other branch of rural life. William Watkins, one mile above, has also a fine scope of land well adapted to fruit-growing and for the production of grain and vegetables. Though the country along the creek is somewhat rugged, yet on account of the excellent land, pure water and romantic surroundings the section has many attractions for those who have a taste for country homes.

Wednesday night I spent at the homestead of R. H. Brown, Esq., $\frac{1}{2}$ miles north of Pescadero. This is a model dairy-ranch of 1250 acres. He keeps 160 head of cows, from which he makes an average of one pound of butter per day to each animal. Arriving in the town of Pescadero on Thanksgiving Day, I was pleased to find it so pleasantly situated between Pescadero and Butano creeks. The streets are regular and wide, and, though the place boasts

of no extremely costly buildings, the residences of many denote taste and thrift. Pescadero, it is claimed, was 20 years ago one of the most lively towns of its size on the coast. Many large sawmills, which have ceased operations, employed many men; besides, farming and gardening in those days employed much help. But long since the land-owners have turned their attention to dairying and stock-raising, which requires but a limited amount of laborers. As a consequence, the solitude of the place is almost painful at times, and is only occasionally broken by the visit of a traveling agent canvassing for books, newspapers, etc., or a company of tourists, for which the vicinity affords solid attractions. One mile below the town is a beach, two miles in length, of singing sand. The singing sand-beach of Manchester, Mass., was formerly supposed to be the only one in the world. I had not the time to spare to pay the beach a visit, but was authentically informed that the music arising from the sand when treading over it is similar to that of the sound produced by walking upon hard, frozen snow. There are also pebble and agate beaches near the town, where are found opals, agate, carnelian, onyx, turquoise and many other precious stones. There is fine hunting and fishing in the neighborhood. The red-woods lay but a short distance to the rear, and taken all in all, it can well be claimed that in seeking a resort, Pescadero should not be wholly overlooked. Those visiting the place will find two hotels, the Swanton house and the Pescadero house. The former is long established, while the latter is new and newly refitted. The proprietor, Mr. Jno. McCormick, seems specially adapted to the position he holds, and spares no pains to make his guests comfortable at very reasonable rates.

Mr. Chas. Wm. Swanton, who had owned and managed the Swanton house for 26 years, died on the 23d inst., and was buried under the auspices of the Masonic fraternity, of which he was a worthy member, on the 25th inst. The obsequies brought together a large number of people for miles around to pay homage to one they highly respected and esteemed. The town and vicinity boasts of a number of men whom it is not only an honor but a pleasure to know. Among these are B. V. Weeks, Esq., dairyman; Mr. Alex. Moore, one of the oldest settlers of Pescadero, owner of a large tract of land, and is engaged in dairying and fruit-growing. Eli D. Moore, his son, is distinguished as having been the first white male born in California, the date of his birth being Dec. 12, 1847. Mr. M. has been a constant reader of the *RURAL PRESS* since the first day it was published and still "stays with it."

Pescadero is well represented by fraternal societies as well as the other concomitants of civilization, such as schools and churches. The Masonic Order has long been established and is in a prosperous condition. The Odd Fellows have a thriving Lodge of 41 members. Their Noble Grand is Mr. Henry Dearborn, and secretary, A. G. Goulson. The Druids boast of a membership of 35, with Mr. A. C. Maxey, N. A., and A. Levy, secretary.

Saturday morning I wended southward along the coast and by evening found myself in front of the pleasant home of I. C. Steele, Esq., where I was courteously received and entertained until Monday morning, when I was reminded that another week's experience of travel lay before me, and I must gird on the armor of battle. Before taking leave of our host and his estimable family, a few observations regarding the lovely homestead they occupy may not be out of place. Mr. Steele's south line runs within a short distance of the northern boundary of Santa Cruz county. Looking to the westward from the site of his residence there stretches out before our eyes a large scope of grazing lands, while just beyond may be seen the foaming waters of the Pacific, whose roar, though some miles distant, may be plainly heard every hour. Gazing eastward, a magnificent panorama is thrust upon our vision. The evergreen Coast Range presents a beautiful contrast with the brown hills that intervene between them and the Pacific ocean.

The comfortable residence, fine gardens of flowers, vegetables and fruits of nearly every variety known to our soil and climate, the pastures stocked with some of the finest cattle and horses in the State, large and commodious buildings for every requirement, including barns and dairy buildings for the prosecution of butter and cheese making on the most approved plans—all these advantages and more we might enumerate, conspire to make this the typical home of a true Patron of Husbandry, an Order with which Mr. Steele has been long and prominently identified, and to which he has, with a self-sacrificing spirit, devoted much of his time and considerable money.

SAM SMALL'S BROTHER.

Why Did God Make So Much Outdoors?
Two Women's Experiences.

"Sam Small, Evangelist!"

The proverbial philosophy of "Old Si," the venerable plantation darkey, who gave to the world through the medium of Small's pen maxims of worldly wisdom, clothed in a verbiage of irresistible humor, has found a permanent place in humorous literature.

Great surprise was shown when it was announced that he having been converted under the ministrations of "Sam Jones," would become an Evangelist.

At first thought a humorist in the pulpit seems incongruous. Is it really so?

No doubt the mere buffoon attempting to turn men's hearts to solemn truths would meet with only contempt. But truth is not hidden in gloom. Genuine humor frequently illustrates and fastens in the mind bits of wisdom that would otherwise pass unheeded.

In his eulogy of Henry Ward Beecher, Rev. Dr. Parker says: "Whenever he came among men, he brought June sunshine and music, and made even desponding and surly men feel that a tulle and warmer summer, 'the Kingdom of Heaven' itself, was 'at hand.'" That is genial Christianity.

Mr. Small belongs to a witty family. He has a brother connected with Arroyo Knox's and "Fat Contributor's" *Texas Siftings*, a paper which has had phenomenal success in the field of humorous literature. Mr. Frank A. Small is the present representative of that popular paper in England, and, like his distinguished brother, he takes a deep interest in the welfare of other people.

Under date of 48 Porten Road, Kensington W. London, Eng., Sept. 27, 1887, he writes: While at Yalding in Kent yesterday, I met Prof. S. Williams, Head Master of the Cleaves Endowed school. In the course of conversation about America, Professor Williams remarked that Warner's safe cure had been of great benefit to his wife, who had been troubled with a disordered liver. Warner's safe cure (an American preparation) was all she had taken, and she had experienced none of her old trouble for some months past.

Mrs. Annie Jenness-Miller, editor of *New York Dress*, and a very popular woman in the fashionable world, says in her own magazine for October: "Warner's safe cure is the only medicine I ever take or recommend. In every instance it gives new energy and vitality to all my powers." This distinguished woman also says that for ladies this great remedy is "peculiarly effective."

Sam Small is likely to succeed as a moral teacher. When we remember how near together in human nature lie the fountains of laughter and of tears, the deeper effect his discourses must have on the masses can easily be imagined.

"Why did God make so much outdoors?" exclaimed a little girl. We know not. He has made it and we should grow in it, broad, charitable and genial, judging everything by merit, not by prejudice.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Consumption Surely Cured.

To the Editor:—Please inform your readers that I have a positive remedy for the above named disease. By its timely use, thousands of hopeless cases have been permanently cured. I shall be glad to send two bottles of my remedy free to any of your readers who have consumption, if they will send me their Express and P. O. address. Respectfully,

T. A. SLOCUM, M. C., 181 Pearl St., New York.

HALL'S SARSAPARILLA

Cures all Diseases originating from a disordered state of the BLOOD or LIVER. Rheumatism, Neuralgia, Boils, Blotches, Pimples, Scrofula, Tumors, Salt Rheum and Mercurial Pains readily yield to its purifying properties. It leaves the Blood pure the Liver and Kidneys healthy and the Complexion bright and clear.

Hardware and Agricultural Implements.
IMPROVED GRANGER GANG PLOW.

WITH ONE EXTRA SHARE TO EACH BOTTOM.

Its success has been unparalleled, and meets a long-felt want for a cheap and effective Gang Plow in a very satisfactory manner.

It has demonstrated conclusively that our plan of putting shares on the bottoms, instead of using what are called "reversible" molds, is the right one. We have proved that one of our small thick, cast-steel shares will last as long as both edges of a double-edged mold, and when it is worn out it can be replaced for less cost than a reversible mold.

A reversible mold is necessarily of an awkward, clumsy shape, being simply a concave piece of steel, just as a board would warp if laid in the sun.

By using shares on our bottoms, we are enabled to make the mold-boards of a form that will draw as easily, and turn as well as those used on any plow.

We put from three to eight plows in a Gang. They cut from 8 to 10 inches each, and will plow from two to six inches deep. This plow is made in a style never before attempted in this State. The frames, which are clear, well-seasoned lumber, are put together in the strongest manner, and are well painted. The wheels are provided with improved detachable hubs, that can be cheaply replaced when worn out.

One of the forward wheels is a castor, thus permitting the plow to run freely, and effecting a great saving in the draft. The bottoms are provided with our chemically-hardened steel molds, that will wear three times as long as the soft sheet-steel molds used by other manufacturers. The shares, which are of double thickness near the point, are cast-steel, and can be easily and quickly sharpened when necessary.

These Gangs do their work evenly, leaving the ground in light, friable condition. They have been thoroughly tested in the field, and the set of the plows on the frame carefully adjusted to secure the lightest draft consistent with good work. SEND FOR ILLUSTRATED CIRCULARS AND PRICE LIST.

The Improved GRANGER GANG, as now constructed, is conceded to be the best Bench Beam Plow in use. It has superseded the reversible Mold Gang wherever introduced; it being more durable, lighter draft, does not require the amount of team, and leaves the ground in much better condition.

WITH LIFTING DEVICE.

The bottoms are provided with our chemically-hardened steel molds, that will wear three times as long as the soft sheet-steel molds used by other manufacturers. The shares, which are of double thickness near the point, are cast-steel, and can be easily and quickly sharpened when necessary.

FERTILIZERS!

FEED THE LAND AND IT WILL FEED YOU!

Fertilizers lessen the necessity for irrigation, increase the yield, improve the quality of crops, and keep the soil in a strong, healthy condition.

SPECIAL FERTILIZERS FOR ALL CROPS.

ENTOMOLOGICAL.

Winter Washes.

Recommended by W. G. Klee, State Inspector.

For Scale Insects on Deciduous Trees.—The wide difference in the atmospheric conditions in the different parts of the State has proved, as might be expected, that different remedies will be found suitable to different localities. When comparing the efficacy of a wash used in one locality with that of another in another locality, we are apt to be misled. Only by trying the same remedy in different localities can definite conclusions be reached. As a general thing, the caustic remedies have been used with good success in the more cool and moist climates of the coast. When well applied, they must be considered among the best and most efficacious we have. On the other hand, they have been generally less successful in the interior of the State, where a dry atmosphere prevails for a longer time.

In using caustic washes, the following points must be especially taken into consideration:

1. Condition of trees.
2. Time of application.
3. Trees must be dormant; otherwise the fruit buds, especially when advanced, will be damaged.
4. A humid atmosphere, without being actually so as to cause water to run down the trees, is much more preferable than very dry weather; in fact, as was proved last season, actual damage has been done to trees when the wash has been applied during such weather, and the results in killing the scale have also been unsatisfactory under such circumstances.

While we still believe that the caustic, in the proportions given below, when used under precisely favorable conditions, is as sure and wholesome a remedy as we can apply to apples, pears and plums, the simple whale-oil and sal-soda remedy, especially for peaches and cherries, has proved very efficacious; but great care must be exercised in applying it, as the oil is apt to separate unless well stirred, and the compound kept warm.

For Pernicious Scale—(Aspidiotus Per-niciosus.)

For badly infested orchards we recommend: 1½ gallons of whale oil; 25 pounds of sal-soda. Dissolve the sal-soda in 25 gallons of water and heat it to boiling. When boiling, pour the whale oil in. Apply the wash when cooled to 130° F. The whale oil forms a kind of emulsion, most of the oil remaining free. After allowing this dose to act for three or four weeks, apply caustic solutions in this proportion: 1 lb. of concentrated lye (American), or 80 per cent; four fifths lb. of powdered caustic soda, or 98 per cent; 1 lb. of powdered caustic soda, or 76 per cent; 1½ lbs. of powdered caustic soda, or 63 per cent; any one of these to one-half pound of commercial potash, at 52 per cent; to be dissolved in six gallons of water.

Mode of Preparing Washes.

The easiest way to prepare the alkali washes, especially the solid concentrated lye, is by suspending the material in a barrel of water, either putting it on a perforated piece of tin or colander. Being thus suspended, the diffusion is quite rapid, and the material will require but little looking after. By using hot or boiling water, the action, of course, is hastened very much. When dissolved thoroughly, each kind having been kept separately, they are mixed and stirred well, so that they become thoroughly mixed. The liquid should be strained through a fine sieve (brass), or a cloth, so that no clogging is possible when the wash passes through the nozzle.

The San Jose nozzle has been and is very generally used, but for lye washes, it is, in my opinion, inferior to the Imperial and the Cyclone. The latter has the advantage of throwing the stream better on the underside of branches and foliage. When a pump with two outlets is at work, the two kinds of nozzles may be used to advantage. One man may work principally on the upper part of the tree with the Imperial (because its spray being thrown straight, hits the more vertical branches squarely), while the other man will reach the lower more horizontal branches better with the Cyclone spray, carrying, as it does, either upward or downward.

A very good nozzle is that invented by John Crofton, and sold by H. P. Gregory and Wood-in & Little. It has the advantage of clearing itself by a turn of the bib. Its spray is similar to that of the Cyclone nozzle.

Object of Caustics.

The object to be obtained by using the caustics after the sal-soda and whale oil is to saponify any oil that might have remained on the tree, and which would have a tendency to clog the pores of the bark. We believe this treatment will prove the most efficacious yet recommended.

The cost of whale oil is 30 cents a gallon, in 50-gallon barrels; 35 cents in cases. As to caustic, it must be remembered that the price will vary according to quantity, and that the purest product is the cheapest. The Greenbank caustic soda 98 per cent is considered the best and the least varying; next to this, American concentrated lye. Geo. F. Lerves, Menzies & Co. seem to be most reliable.

For a Lightly-Infested Orchard.

In the moist coast counties we would recom-

mend the caustic in this proportion, for pears, apples and plums, the trees to be perfectly dormant: 1 lb. of solid concentrated lye (American), or 80 per cent; 4-5 lb. of powdered caustic soda, or 98 per cent; 1 lb. of powdered caustic soda, or 76 per cent; 1½ lbs. of powdered caustic soda, or 63 per cent. Any one of these to ½ lb. of commercial potash, at 52 per cent. To be dissolved in 4 gallons of water; ½ lb. of whale-oil soap (80 per cent) to each gallon of mixture.

For peaches and cherries, and in the drier localities, whale-oil and sal-soda in this proportion: 1 gallon of whale-oil to 25 lbs. of sal-soda, 25 gallons of water. Prepare the same as above.

Next week we will give other washes, viz., the lime and sulphur, which is highly praised in the San Joaquin valley, and preparations commended by Sol Ranyon of Sacramento River.

The Last Spike.

Full details for the two great "last-spike" excursions have been prepared at the general offices of the Southern Pacific. It has been finally decided that the first excursion will leave here on Monday, the 12th inst., at 4 o'clock P. M., reaching Ashland on the afternoon of the 13th. This is a special excursion, to which invited guests only will be admitted. The second excursion, which is for the general public, will leave the city on Tuesday, at 4 P. M., reaching Ashland on Wednesday at the same hour. At Ashland the last spike will be driven. A stop over will be made at this point until next morning at 7 o'clock, when the journey north will be resumed. This schedule of time is adopted to enable the excursionists to view by daylight the grand scenery of the Rogue River valley, Grant's Pass, Crow Canyon and Yumacalla valley. Eugene City, at the head of the Willamette valley, will be reached by nightfall, the train to arrive at Portland by twilight. The party will remain in Portland until 1 P. M. on Saturday, thus making the run through the upper portion of the Willamette valley in the daylight. The special will reach San Francisco on Sunday morning, the 19th inst., about 8 o'clock. So far as the California end is concerned, the run through it will be made both ways by daylight, thus giving the amplest opportunity to see the scenery both through Shasta and the Siskiyou. The price of the round trip will be \$25, including sleeping-car berth throughout the entire journey.

Trouble with the Calves.

EDITORS PRESS:—A disease entirely new to me has started among my calves. They are first taken with itching about the anus and down to the udder and will rub themselves (if permitted) until they tear or lacerate themselves, and this is accompanied with a spasmodic jerking of the hind quarters. There is no loss of appetite for the first 12 hours, but after that the itching is more aggravating and the spasms more frequent, and comes as often as three per minute and accompanied with very intense pain, and proves to be fatal in from 36 to 48 hours from when first taken.

Can any reader tell me what the disease is and what is a remedy?—A. J. RIDER, Galt, Sac. County, Cal.

DIED INTO NEW LIFE.—Dr. O. F. Shaw has handed us a very singular specimen of vegetation. It is a blue potato which grew out of another potato lying on a shelf in a dark closet under the stairs in his house at Seattle. The old potato, which was but little larger than the new one, shrunk away as its life and material was transferred to the younger growth, and its brown and shriveled skin still adheres loosely to one side of the latter. These tubers, parent and child, thus connected afford an interesting example of the transmission of life "from form to form," and serve to illustrate, if not support, the doctrine of metempsychosis.

TO PARADISE BY RAIL.—A correspondent of the Dixon Tribune says that a Chicagoan, to whom had been sent one of the Solano county pamphlets, acknowledged its receipt, adding that he had read it with great interest, and it was only fair for him to acknowledge that for 50 years he had harbored a wild delusion. Heretofore he had always believed that the only way to enter paradise was to shuffle off this mortal coil and cross over Jordan, but that unpretending little book had informed him that that greatly desired realm can now be reached by rail.

THE S. F. Pure Milk Trust Co. has filed articles of incorporation with the county clerk to dispose of milk in this city, construct refrigerating cans and erect cold-storage houses. Capital, \$100,000, divided into 100,000 shares. Directors—Gerald M. Fennell, J. W. Borche, Herold D. Mitchell, W. M. Brown and Jas. C. Lecony.

THE GREAT TELESCOPE.—A car containing tubes, clockwork and mountings for the Lick Observatory arrived at San Jose last Sunday, and was conveyed to Mount Hamilton on wagons the following day. Another car is expected to arrive during the present week.

THE freights of John P. Squire, the Boston hogman, are said to be worth \$1,000,000 a year to the railroad which secures them.

The President's Message.

The Congress of the United States having re-assembled at Washington on Tuesday, Dec. 6th, President Cleveland sent in his message, which was read in both houses. The document deals almost entirely with questions of national finance—surplus revenues and tariff reduction, free trade and protection. It is said to be regarded at the Capital as fixing the Democratic position in the next Presidential campaign and laying down the lines on which will be fought the battle of 1888.

The part which interests California farmers more especially and immediately is as follows:

The farmer and agriculturist who manufactures nothing, but who pays the increased price which the tariff imposes upon every agricultural implement and upon all he wears and upon all he uses and owns, except the increase of his flocks and herds and such things as his husbandry produces from the soil, is invited to aid in maintaining the present situation, and he is told that a high duty on imported wool is necessary for the benefit of those who have sheep to shear, in order that the price of their wool may be increased. They, of course, are not reminded that the farmer who has no sheep is by this scheme obliged, in his purchase of clothing and woolen goods, to pay a tribute to his fellow-farmers as well as to the manufacturer and merchant; nor is any mention made of the fact that the sheep-owners themselves and their households must wear clothing and use other articles manufactured from the wool they sell at tariff prices, and thus as consumers must return their share of this increased price to the tradesman. I think it may be fairly assumed that a large proportion of the sheep owned by the farmers throughout the country is found in small flocks numbering from 25 to 50. The duty on the grade of imported wool which these sheep yield is 10 cents each pound of the value of 30 cents or less, and 12 cents if the value be more than 30 cents. If the liberal estimate of six pounds be allowed for each fleece the duty thereon would be 60 or 72 cents, and this may be taken as the utmost enhancement of its price to the farmer by reason of this duty. Eighteen dollars would thus represent the increased price of the wool from 25 sheep and \$36 that from the wool of 50 sheep, and at present values this addition would amount to about one-third its price. If on its sale the farmer receives this or a less tariff-profit, the wool leaves his hands charged with precisely that sum which in all its changes will adhere to it until it reaches the consumer.

When manufactured into cloth and other goods and material for use, the cost of wool is not only increased to the extent of the farmer's tariff profit, but a further sum has been added for the benefit of the manufacturer under the operation of other tariff laws. In the meantime the day arrives when the farmer finds it necessary to purchase woolen goods and material to clothe himself and family for the winter. When he faces the tradesman for that purpose he discovers that he is obliged not only to return, in the way of increased prices, his tariff profit on the wool he sold, and which then, perhaps, lies before him in manufactured form, but that he must add a considerable sum thereto to meet a further increase in cost caused by a tariff duty on the manufacture. Thus, in the end he is aroused to the fact that he has paid upon a moderate purchase, as a result of the tariff scheme, which, when he sold his wool seemed so profitable, an increase in price more than sufficient to sweep away all the tariff-profit he received upon the wool he produced and sold.

When the number of farmers engaged in wool-raising is compared with all the farmers in the country, and the small proportion they bear to our population is considered, when it is made apparent that in the case of a large part of those who own sheep the benefit of the present tariff on wool is illusory, and above all, when it must be conceded that the increase of the cost of living caused by such a tariff becomes a burden upon those with moderate means, and the poor, the employed and the unemployed, the sick and well, and the young and old, and that it constitutes a tax which, with relentless grasp, is fastened upon the clothing of every man, woman and child in the land, reasons are suggested why the removal or reduction of this duty should be included in a revision of our tariff laws.

In speaking of the increased cost to the consumer of our home manufactures resulting from a duty laid upon imported articles of the same description, the fact is not overlooked that competition among our domestic producers sometimes has the effect of keeping the price of our products below the highest limit allowed by such duty. But it is notorious that this competition is too often strangled by combinations quite prevalent at this time, and frequently called "trusts," which have for their object the regulation of the supply and price of commodities made and sold by members of the combination. The people can hardly hope for any consideration in the operation of these selfish schemes. If, however, in the absence of such a combination a healthy and free competition reduces the price of any particular dutiable article of home production below the limit which it might otherwise reach under our tariff laws, and if, with such reduced price, its manufacture continues to thrive, it is entirely evident that one thing has been discovered which should be carefully scrutinized in an effort to reduce taxation.

The necessity of combination to maintain the price of any commodity furnishes proof that some one is willing to accept lower prices for such commodity, and that such prices are remunerative, and lower prices produced by competition prove the same thing. Thus, where either of these conditions exists, a case would seem to be presented for an easy reduction of taxation.

BUENA VISTA RANCHO.—Messrs. Tyler Beach and J. C. Hagg, who are selling this desirable property near Salinas City, have issued a neat circular with a map of the tract, of which the circular says: "The finished and artistic map on the first page was made by the Dewey Engraving Co., 220 Market street, S. F." This company has extra facilities for doing such work, and the fact will probably be of interest to those who are mapping tracts for sale in subdivisions.

Rainfall at Sacramento.

We present once more the tabular statement of rainfall at Sacramento which we have been accustomed to give from year to year. It is very valuable, not merely to those who live in the great valley of California, but also to the general student of meteorology, as it affords the means of comparing the rainfalls in the interior and upon the coast as recorded in this city. We are again under obligations to Sergeant Barwick for his kindness in furnishing revised figures to date.

Table with columns for months (January to December) and years (1849 to 1887). It contains rainfall data in inches for each month and year, with a total row at the bottom. The table is arranged according to seasons, showing the amount in inches of each month, during thirty-four years, and for each rainy season, to Dec. 1, 1887; also the quantity for every month, and the annual amount of rain.

Rain Table for Sacramento, Prepared to 1884 by the late Dr. T. M. Logan and the late Dr. F. W. Hatch, and since 1884 by Sergt. J. A. Barwick.

Breeders' Directory.

Six lines or less in this Directory at 50c per line per month.

S. F. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Dec. 7, 1887.

The past week has been quiet in all lines of produce, but the tone of the market was firm. It is claimed that in many sections more rain is required to set the plows to going freely. A good, general-soaking rain will be followed by free plowing and seeding. The Eastern and European wheat markets have ruled very strong throughout the week, although Chicago broke on Tuesday, but then prices there were above English parity, owing to a short interest buying. To-day's cable is as follows:

LIVERPOOL, Dec. 7.—Wheat, weaker, California spot lots, 6s 7d to 6s 10d; off coast, 34s; just shipped, 34s 9d; nearly due, 34s; cargoes off coast, quiet; on passage, not much demand; French country markets, tone generally firmer; flour and wheat in Paris, steady; weather in England, frosty.

Foreign Review.

LONDON, Dec. 5.—The *Mark Lane Express* says: Trading in English wheat is dull in London, values steady and deliveries small. Provincial markets are weaker. Sales of English wheat for the week were 67,450 quarters at 31s 3d, against 52,455 quarters at 32s 7d for the corresponding week of last year. Flour is depressed, owing to large arrivals. Foreign wheat dealings are restricted. The excitement in American options failed to affect spot trade here. Reports of the wheat harvest in Australia and the Argentine Republic promise a large increase of shipments. Flour is dull. Corn is scarce and values are rising. There were four arrivals of wheat during the week. Two were withdrawn and two remain. At to-day's market wheat was in steady demand and unchanged. Corn was 6d @ 1s dealer. Oats are in good inquiry and 3d higher. Linseed declined 6d. Flour, beans and peas were unchanged.

Eastern Grain Markets.

S. S. Floyd & Co.'s telegraph of the 7th, from their Chicago house, is as follows: Wheat market strong, active and higher to-day; outside buying orders were too much for the local bears and they got tired out trying to hold the market down, and turned around and were busy covering their shorts, which closed market firm at about top price of the day. Corn market also strong and higher, in sympathy with wheat together with active demand from the country bulls. Receipts of wheat at 7 primary points to-day, 248,307 bu.; shipments, 66,750 bu. Wheat, Jan., opened, 76½; highest, 78½; lowest, 76½; closed, 78½; May, opened, 84½; highest, 85½; lowest, 83½; closed, 85½. Corn, Jan., opened, 48½; highest, 50½; lowest, 48½; closed, 50½; May, opened, 53½; highest, 55½; lowest, 53½; closed, 55½. Pork, Jan., opened, \$14.25; highest, \$14.80; lowest, \$14.20; closed, \$14.77½.

NEW YORK, Dec. 7.—12 M.—Wheat, 91½c for cash, 90½c for Jan., 91½c @ 91½c for Feb., 92 3/8c for March, and 94½c for May.

Eastern Wool Markets.

NEW YORK, Dec. 5.—The stock of wool here is still light. Holders are not seeking buyers and there is no active outlook. Free receipts from South America are expected. Sales are reported of 35,000 lbs. ¼ @ ¾ blood, washed, 37 @ 37½c; 4000 lbs. X @ XX, 32 @ 33c; 20,000 lbs. unwashed, ¼ blood, 28c; 10,000 lbs. fine unwashed, 22 @ 23c; 50,000 lbs. scoured Texas, 44c; 14,000 lbs. scoured California, 49c; 50,000 lbs. Eastern Oregon, 20 @ 24c; 60,000 lbs. Territory, 18 @ 20c; 175 bales of foreign on private terms.

The Philadelphia market is quiet and Boston steady.

California Products in Chicago.

CHICAGO, Dec. 3.—Lately packed California fruits are moderately active and rule low and steady. The following prices were received for fruit in good condition: Muscat grapes, in double crates, \$3.75 @ 4.25; Vordell grapes, in double crates, \$3.50 @ 3.75; cold-storage grapes and half cases, \$1 @ 1.25; Vicar pears, \$2; Winter Nelis pears, \$2 @ 2.50; Giant Marcon pears, \$2.25 @ 2.75; Late Red plums, in 20-lb boxes, \$1.25 @ 1.75.

California dried fruit and raisins are steady at late quotations. Peaches, sun-dried, in sacks, ½ lb, 11½ @ 12½c; peaches, evaporated, unpeeled, in sacks, ½ lb, 15½ @ 16c; do do, peeled, in sacks, 21½ @ 27½c; apricots, sun-dried, in sacks, per lb, 13½c; apricots, evaporated, in sacks, 14½ @ 16c; plums, pitted, in sacks, per lb, 13 @ 14c; nectarines, according to quality, in sacks, per lb, 13½ @ 15c; raisins, London Layers, per box, \$2.10 @ 2.25.

A quiet and slow market is quotable for hops. The demand is limited; common grades especially are not only exceedingly slow, but they are also very weak. Pacific's new crop, choice, 16 @ 18c; Pacific's new crop, medium, 14 @ 16c; Pacific's new crop, common and low grades, 12 @ 13c; Pacific's 1886, good, 10 @ 12c; Pacific's 1886, medium, 9 @ 10c; Pacific's 1885, 5c.

The feeling in the market for beans is firm. There is a very good trade in California beans. Some foreign beans also sell, but they are not giving the best of satisfaction, for the reason that they run uneven, both in size and quality. Choice Eastern beans are wanted, and they are firm, but there is an absence of stock. Quotations are, California, according to quality, \$2.15 @ 2.30.

California strained honey brings 7 @ 8c.

Hops.

NEW YORK, Dec. 5.—Hops are dull, with some export inquiries, but no suitable qualities are on hand. Brewers are using cheap State. The best German are quoted at 27c, and Pacific 16c.

California Raisins in New York.

A telegram from N. Y., Dec. 7th, referring to the recent arrival of California raisin trains, reports the demand for the best grades greater than the agents can fill, and says most of the fruit was sold before it arrived here.

NEW YORK, Dec. 5.—California raisins are in good offering for distribution. The Chalmette from New Orleans to-day brings 19,000 boxes for New York, and 14,000 for New England. Prices for prime

hold full; common is weak, with the increase offering Malaga cables report an exhausted stock.

Local Markets.

BAGS.—In Calcutta standard size on spot, little is doing, but for June-July delivery sales are reported at 7½c to 7½c.

BARLEY.—The market has held to strong prices throughout the week, with sales made at an advance on the top quotations of the daily papers. The stock here and supply in the country are not excessive, considering the large increased consumption, and also that there are yet all of six months before the next crop is harvested. On Call, options have ruled strong and active. To-day's sales are reported as follows:

Morning Session: Buyer season—100 tons, 98c; 100, 97½c; 100, 97½c; 100, 97 3/8c. Afternoon Session: Buyer season—100 tons, 97c; 100, 97 1/4c; 100, 97 3/8c. Buyer 1887—100 tons, 89c @ ctd.

BUTTER.—The demand is freer, while the receipts continue light, with stocks extremely light. The market closed very strong, but, as a rule, dealers are disposed to clean up all around, and to do which they do not ask more money.

CHEESE.—Choice new cheese is scarce and wanted, but other kinds are in large supply and hard to place.

EGGS.—The market is easy. The receipts from the West and also from Utah continue liberal, and as the quality is fair to choice, they keep California's down.

FLOUR.—No advance yet in prices, although one has been looked for several days.

WHEAT.—The sample market offerings continue light, as holders are firm in their advanced views. The reduction in stocks, with a large tonnage loading and a very large disengaged tonnage in port, together with strong foreign markets, are the "bracers" in the market. On Call, options have been fairly active. To-day's sales are reported as follows:

Morning Session: Buyer season—200 tons, \$1.47½; 400, \$1.47 7/8. Buyer 1887—100 tons, \$1.38½; 100, \$1.37½ @ ctd. Afternoon Session: Buyer season—900 tons, \$1.48 1/4; 200, \$1.48 1/8. Buyer 1887, season's storage paid—300 tons, \$1.38½ @ ctd.

COMMUNICATED.]

Market Information.

Receipts of Domestic Produce.

The following are the receipts of the principal items of California produce at San Francisco from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 to Dec. 4, '86.	July 1 to Dec. 3, '87.
Flour, qr. sks.	2,170,270	1,522,094
Wheat, cts.	4,422,954	4,422,954
Barley, cts.	1,600,880	1,432,609
Oats, cts.	100,713	116,051
Potatoes, sks.	461,667	523,453
Corn, sks.	31,434	103,902
Rye, sks.	11,242	11,382
Buckwheat, sks.	4,168	742
Beans, sks.	258,468	293,185
Brans, sks.	220,599	2,6430
Hay, tons.	55,194	62,833
Salt, tons.	11,918	8,720
Wool, bls.	44,283	37,499
Hides, No.	51,094	46,087
Raisins, 20-lb boxes.	90,094	60,816
Quicksilver, flasks.	6,362	12,245
Hops, bls.	11,779	13,226

The receipts of certain articles of produce from Oregon, Washington Territory and other distant points, for the same period, compare as follows:

	July 1 to Dec. 4, '86.	July 1 to Dec. 3, '87.
Flour, sks.	22,561	94,751
Wheat, cts.	141,315	358,449
Barley, cts.	1,493	75
Oats, cts.	157,935	80,385
Corn, cts.	46,262	12,980
Wool, bales.	9,054	6,986
Brans, sks.	26,418	29,400
Hops, bales.	648	106
Hides, No.	14,951	12,591
Potatoes, sks.	22,872	2,247

The upward trend now noted in the English wheat market in October was continued throughout November, the changes in California cargo quotations for that month being as follows:

	Off Coast.	Just Shipped.	Nearly Due.
November 1.....	33 1/2	33 1/2	33 1/2
November 4.....	33 1/2	33 1/2	32 1/2
November 5.....	33 1/2	33 1/2	32 1/2
November 8.....	33 1/2	33 1/2	32 1/2
November 11.....	33 1/2	33 1/2	33 1/2
November 14.....	33 1/2	33 1/2	33 1/2
November 15.....	33 1/2	33 1/2	33 1/2
November 16.....	33 1/2	33 1/2	33 1/2
November 17.....	34 1/2	34 1/2	34 1/2
November 19.....	34 1/2	34 1/2	34 1/2
November 21.....	34 1/2	34 1/2	34 1/2
November 30.....	34 1/2	34 1/2	34 1/2

The monthly range for the first 11 months of the current year is as follows:

	High.	Low.	High.	Low.
Jan. 38s od 36s 9d	40s od	38s 3d	39s 6d	37s 0d
Feb. 36 3/4	36 3/4	36 3/4	37 1/2	36 3/4
Mar. 38 3/4	36 3/4	36 3/4	37 1/2	36 3/4
April 38 3/4	38 3/4	36 3/4	38 3/4	37 1/2
May 39 3/4	38 3/4	36 3/4	40 3/4	37 1/2
June 39 3/4	38 3/4	36 3/4	40 3/4	39 3/4
July 39 3/4	39 3/4	36 3/4	39 3/4	39 3/4
Aug. 39 3/4	39 3/4	36 3/4	39 3/4	39 3/4
Sept. 39 3/4	39 3/4	36 3/4	39 3/4	39 3/4
Oct. 39 3/4	39 3/4	36 3/4	39 3/4	39 3/4
Nov. 39 3/4	39 3/4	36 3/4	39 3/4	39 3/4

The exports of wheat from this port during November were as follows:

	Cents.	Value.
Great Britain.....	548,952	\$730,527
Havre.....	6,693	8,450
Hawaiian Islands.....	814	1,103
Tahiti.....	48	80
Elsewhere.....	14	19
Totals.....	556,521	\$740,179

Cereals.

The English market has ruled strong throughout the week, with a sale of No. 1 California white shipping for prompt shipment made at 35s 3d. The strength of the market is no doubt due, as the *Financial Chronicle* says, to confidence respecting the future which is becoming stronger, and the belief frequently hitherto expressed that as the year grew older trade would become more active is being verified. At the same time it is noticeable that the reports from all the leading centers in England, whether of the textile manufactures or the hardware industries, although acknowledging the stronger position of trade generally, state that business has been "quiet," or only about up to the "average." In view of the facts disclosed by statistics, only one construction can be placed upon this circumstance, and that is that the operations now being carried on are of a legitimate character, and that the better tone existing is not appreciably due to speculative manipulation. It may therefore be assumed that the profits earned are real and tangible.

The Eastern market for wheat advanced fully 3c per bu., but on Tuesday fell back. The advance was chiefly due to a corner. Outside of this the wheat market has a very strong tone.

In the local market wheat has ruled strong, with few sellers. Exporters to buy were compelled to bid an advance, and this, too, with the daily press aiding them all they can in quotations and remarks on the market. The stock the past month decreased over 40,000 tons, with this month showing a still further decrease. The mills are large consumers, and besides there is an increased call for seed.

Barley has held strong throughout the week, with a slight advance at the close, and this, too, with the bears hammering away at prices so as to break values. The stock the past month decreased over 5000 tons, and this, too, in the face of good deliveries from farmers. The consumption continues large. The brewing grades of barley this year are not heavy, and consequently only fetch a little more than feed. The Washington Territory crop this year is colored, owing to rains in last September. The off color operates against it, fetching good prices.

Corn is very strong, with concessions hard to get. The strength of the market is due to short crops at the West and the certainty of an advance in freights in next month. The demand with us is only fair.

Oats are steady, with a strong tone. The stock is only fair, while the receipts are light, with the supply to draw from in Oregon only moderate and strongly held.

Rye is strong at full quotations, owing to light stocks and light supplies.

Buckwheat is in fair demand at current quotations.

Feedstuff.

Bran and middlings move off freely, but owing to liberal supplies, the market is easy. Oregon sends us liberal supplies of both bran and shorts.

Oilcake meal is in fair supply, with a good demand ruling.

Feed carrots and feed potatoes are in good supply, with the market steady.

Choice to extra choice hay continues to come forward sparingly. The stock here is light, with the stables only buying in a hand-to-mouth way. The consumption, since the rains, has increased. The market for all grades is very strong.

Vegetables.

Free rains up to Monday interfered with receipts of potatoes, and the demand was free and stocks of the better grades light. Even feed potatoes have been well cleaned up.

Onions are strong at full prices. Receipts are only fair, while the demand has been good, particularly for the better varieties, to fill shipping orders.

Tomatoes, beans and peas are gone out, as are several other summer vegetables.

Cabbages are strongly held, with extra choice, good, hard keepers in demand for filling shipping orders.

Root vegetables are in good supply, with a fair demand ruling.

Fruits.

Apples continue to meet with a good demand, with the more choice fetching good prices. Sals of extra have been made in a small way as high as \$1.75.

Pears are in good demand, with a strong market ruling for the more choice varieties.

California oranges are putting in an appearance, but as receipts are light, quotations are high and more or less nominal.

Raisins are very strong and active, with good prices obtainable. Considerable loose in sacks are coming to hand, and fetch 5 to 6c per lb. These are taken by restaurants, hotels, bakers and other large consumers. The East is still drawing heavily. The stock in this State is light for the season.

Dried fruits are dull, but as the stock is light and the supply also light, concessions are hard to get, for holders have confidence that better prices will obtain after the turn of the year. The trade, as a rule, are carrying light stocks.

Live-Stock.

In beef cattle there is no particular change. The offerings, though not as large as in last month, are ample. Continued free receipts are reported from Arizona, and as the railroad to Oregon will soon be in working condition, receipts are looked for from there. Mutton sheep are firm and in fair supply. Milch cows are inquired for, but no sales reported.

Hogs continue to come to hand freely, but as packers take all offering, the market for grain-fed remains strong. Some few corn-fed are coming in; they sell at about 4c per lb. on foot, equal to about 5½c to 5½c dressed. In horses there is nothing new to report.

The following are the wholesale rates of slaughtermen to butchers:

BEEF—Extra, 7½ @ 7½c; first grade, grass fed, 6½ @ 7c; 2nd grade, 6 @ 6½c; third grade, 5½ @ 5½c.

MUTTON—Ewes, 5½ @ 6c; wethers, 6 @ 6½c.

LAMB—Spring, 7 @ 8c.

VEAL—Large, 6 @ 7c; small, 6 @ 8c.

PORK—Live hogs, 4½ @ 4½c for heavy and medium; hard dressed, 6½ @ 7c per lb; corn fed, 4 @ 4½c; dressed, 5½ @ 6½c; soft hogs, live, 3½ @ 4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Miscellaneous.

Grass seed meets with a better inquiry. The market is strong at full figures.

Brown mustard seed is about out of market, but yellow offers freely.

Hops are still talked down. A real choice parcel finds ready buyers, but this year the quality is variable and unsatisfactory.

In wools there is little doing, as is always the case at the close of the year. The stock here is light.

In poultry, the market ruled firm throughout the week, with choice, well conditioned fowls in light receipt.

Lard is strong, with an advancing tendency.

Beans are very strong, under light stocks, light supplies and a good demand. Pinks and Reds are higher.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	318,339	212,182
In port, disengaged.....	97,539	73,761
In port, engaged.....	27,848	68,620

Totals..... 443,726 354,563

To obtain the carrying cap city add 60 per cent to the registered tonnage.

San Francisco, Dec. 7, 1887.

DOMESTIC PRODUCE

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

Art Publications for Christmas and New Year.

With the recurrence of Christmas and the New Year come the artistic holiday publications of Messrs. L. Prang & Co. Very much, indeed, is due to this firm for the rapid growth of art taste now manifest in this country. The novelty of their designs, the decorations with which they are embellished, and the form in which their latest efforts to please have been presented, evince their determination to keep pace with their most skillful competitors in this branch of industry. Among their cards abounding with varied designs, the most aesthetic, perhaps, is that by the renowned poet-artist Celia Thaxter. It is a branch of olive in full fruitage, elegantly painted and with a Greek motto in praise of the olive, as consecrated to Athene, and on the reverse a poem by Mrs. Thaxter, in autograph reproduction. Among these cards are charming flower designs, combinations of flowers and landscapes, seasons, animals and birds. The figure designs are very fine, especially two laughing babies, one of them in a basket and the other tied up in a blanket and suspended from spring scales, to be weighed. The satin art-prints are elegant, and some of the sachets, handkerchief-holders and pockets, are quite elaborate. In calendars, this year's product is rich in varieties. Besides several booklets, there are five art-books in imitation of water-color, entitled "A Gay Day for Seven," "Echoes in Aquarelle from Along the Shore," "A Christmas Processional," The Voice of the Grass," and the "Home of Evangeline." Everything offered by Messrs. Prang & Co., as souvenirs of the departing, and salutations to the coming year, is worthy of commendation.

"MELICAN HEATHEN."—This story is going the rounds of the Eastern papers, and it is just as good here as over there: A Chinaman applied for the position of cook in a family in a Western city. The lady of the house and most of her family are members of a fashionable church, and the Chinaman was questioned closely. "Do you drink whisky?" "No," said he, "I Clistian man." "Do you play cards?" "No, I Clistian man." He was employed and gave great satisfaction. He did his work well, was upright, correct and respectful. After some weeks the lady gave a progressive-euchre party, and had wines at the table. John was called upon to serve the party, and did so with grace and acceptability. But the next morning he waited on the lady and said he wanted to quit. "Why, what is the matter?" she inquired. John answered: "I Clistian man; I tole ycu so before; no heathen. No workee for Melican heathen."

HOREHOUND HONEY IN SHASTA.—It is stated that a beeman from Southern California has discovered a canyon in Shasta county where horehound flourishes in great profusion, and proposes to start an apiary there. Horehound honey is used extensively in pulmonary complaints.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

- FOR WEEK ENDING NOVEMBER 29, 1887.
- 373,808.—FRUIT-DRIER—A. Blatchly, S. F.
 - 373,928.—INSECTICIDE—W. A. Garner, Fresno, Cal.
 - 374,060.—SPRING ROLLER—E. Gres, Tombstone, A. T.
 - 373,939.—DEVICE FOR LIFTING GOODS FROM SHELVES—L. M. McLaren, Crescent City, Cal.
 - 373,944.—THRASHER FEEDER—W. E. Phillips, Wilmington, Cal.
 - 373,906.—VINEYARD CULTIVATOR—H. B. Reed, Woodland, Cal.
 - 374,011.—EMULSION TO PROTECT FRUIT TREES—T. W. Smith, Santa Rosa, Cal.
 - 17,916.—DESIGN—S. H. Lucas, San Bernardino, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

CAPT. J. H. DRUMMOND of Glen Ellen has been appointed by Gov. Waterman a member of the Board of Agriculture for District No. 4 (Sonoma and Marin) vice self, term expired.

THE British bark Pak-Wan sailed from Vancouver last week for South Australia, carrying 500,000 feet of lumber, 12,000 pickets and 6000 bundles of laths.

THE Pioche Record says that coyotes come into town in broad daylight and carry off chickens and turkeys.

AMONG the out-of-the-way shipments from Carson City this season has been 75,000 pounds of pine nuts.

H. M. NEWHALL & CO.,

SHIPPING AND COMMISSION MERCHANTS,

309 and 311 Sansome Street, San Francisco, Cal.

Agents for Growers and Manufacturers. Charterers of Vessels for all Trades. Agents for the Mexican Phosphate and Sulphur Company's Products. General Insurance Agents.

Have correspondents in all the chief cities of the United States, Europe, Australia, India, China and the principal islands of the Pacific. Purchase goods and sell California products in those countries.

VACAVILLE SHIPS ORANGES.—The first shipment of oranges from the Vacaville citrus belt was made Dec. 3d by Charles Martelle, who sent 5000. They had been picked a week, but the shipment was delayed by the bad roads. They are large and fine.

THE Pope is said to be very fond of agriculture, and to have a passion for planting trees. One of his first acts after his election was to plant the garden of the Vatican with fruit trees and vines, and this year the grapes of the garden are turned into wine under his personal supervision.

EUCALYPTUS trees have made so much trouble in Alameda, by thrusting their rootlets into cracks in sewers and filling up the pipes, that an ordinance declaring all trees of that genus growing on public streets to be a nuisance has been proposed to the Trustees.

Somebody's Child.

Somebody's child is dying—dying with the flush of hope on his young face, and somebody's mother thinking of the time when that dear face will be hidden where no ray of hope can brighten it—because there was no cure for consumption. Reader, if the child be your neighbor's, take this comforting word to the mother's heart before it is too late. Tell her that consumption is curable; that men are living to-day whom the physicians pronounced incurable, because one lung had been almost destroyed by the disease. Dr. Pierce's "Golden Medical Discovery" has cured hundreds; surpasses cod-liver oil, hypophosphites, and other medicines in curing this disease. Sold by druggists.

Beautiful Women

Are made pallid and unattractive by functional irregularities, which Dr. Pierce's "Favorite Prescription" will infallibly cure. Thousands of testimonials. By druggists.

Dr. Pierce's "Pilllets"—the original "Little Liver Pills" (sugar-coated)—cure sick and bilious headache, sour stomach, and bilious attacks. By druggists.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

BARREN HILL NURSERIES

NEVADA CITY, CAL.

SPECIALTIES:

NUTS, PRUNES AND GRAPES.

The Finest Collection of "Nut-Bearing" Trees to be Found in the United States.

21 Varieties of Walnuts,

INCLUDING

CLUSTER WALNUT (Juglans Racemosa).

The newest, most prolific and valuable variety ever introduced into this country.

PRÆPARTURIENS,

Or FERTILE WALNUT, introduced into California in 1871 by Felix Gillet.

"Second" Generation Præparturiens,
(California Grown).

"Second Generation" trees, grown from nuts borne on the original tree; 80 to 90 per cent guaranteed to be "pure," or having retained the characteristics of the original Præparturiens, chief among them the surprising fertility of that type.

Third Generation Præparturiens or common French walnut (Juglans Regia), grown from nuts borne on Second Generation trees, all California grown. Vigorous and fertile variety, but the nuts smaller than those of the second generation.

GRAFTED WALNUTS.

Franquette Parisienne, Mayette, Chaberte, Meylan, Vourey and "Weeping" Walnuts, the leading varieties of Europe, highly recommended for the size, beauty and quality of the nuts, fertility, and above all, "hardiness" of the kinds.

We offer this season imported trees of the seven above sorts, expressly grafted for us, regardless of cost. The difficulty in grafting the walnut is such, and grafted walnuts are so scarce, that we are compelled to decline orders for such trees in quantities over a dozen. Only a limited number of trees of each kind from four to six feet.

"MARRONS" or French Chestnuts.

(Solely propagated from grafting.)

MARRON COMBALE (California grown).

10 Varieties of the finest kinds of Marron-Chestnuts to be found anywhere; at the head of the 1st "Marron Combaie," which we have been fruiting upon our place the last 13 years; very large and sweet nut, prolific; one of the very best for market.

7 Varieties of Filberts.

4 Varieties of Almonds.

4 Varieties of April Cherries, the earliest and most prolific in California.

245 Varieties of Grapes, from all parts of the world, including the earliest Table Varieties known, some of them 25 days earlier than Sweet Water.

61 Varieties of English Gooseberries, all shapes and colors, some large as walnuts; all "true to name."

CORK OAK, 2-year-old Trees, from Spain.

Prunes! Prunes!

Lot D'Ente, or D'Ente "true from the root," one of the best and finest types of the "French Prune" and the kind so extensively cultivated in the prune district of France. This type is not propagated from grafting, which would do away with its chief qualities of being more vigorous, more long-lived than grafted trees, and a "gum-resistant" stock.

Also, the finest grafted types from the home of the Prune D'Ente or D'Agen, on Myrobalan, St. Julien and Almond stock.

Saint Catherine (true from the root), one of the finest dessert Plums, and one of the best for preserving and drying.

Puymirol D'Ente, Blue and Red Perdigran, German and Italian Guesche, Alsace Guesche, Knight's Green Drying, etc.

Apricots, Peaches, Pears,

Quinces, Plums, Mulberries,

Figs, Fancy Fruits, Etc.

FRENCH, ENGLISH, GERMAN AND AMERICAN
STRAWBERRIES.

Send for General Descriptive Catalogue, illustrated with forty-one cuts, representing Walnuts, Chestnuts, Filberts, Prunes, Medlar and Sorbus.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE!

FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KOEBIG—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Pota-h.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture.
BERKELEY, Nov. 20, 1886.

Dr. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

TRUMAN, ISHAM & HOOKER.

Our Racine Four-Spring Wagon

THE ONLY A GRADE WAGON ON THE COAST.

No. 100 A-1½ Axle and Break.

No. 100 A-1½ Axle and Brake.

It has Double Collar, Steel Axles and Steel Tires; Nickel Rail on dash; Leather Cushions; all selected material, and elegantly painted and trimmed; White-wood Body; Hardwood Sills and Bottom. An important feature of this wagon is that the

Felloes are Riveted each side of Spoke.

It is A grade in every particular. Poles, Neck-Yoke and Doubletrees, and with Patent Fifth Wheel. It is the Premium Wagon of this coast. With or without top.

OUR DANDY CART.

SINGLE SEAT.

Price, \$35.

Terms Cash.

Delivered at any Railroad or Steamship Station in California.

It beats the Chicago, and at half the price. It is simple, light and durable. It is made of the best material and workmanship. Finished in oil and varnish. Best cart for the money in the market. Will sell readily.

New Bradley Vineyard Plow.

Especially Adapted for Cultivation of Vineyards and Orchards. The Only Practical Vineyard Plow Manufactured.

This Plow is one of the latest things out, and is the most complete tool of its kind in the market. It has crooked standard and shifting handle, so that it can be run close under the trees or vines without breaking or injuring them. There has been a large number placed in California Vineyards during the past year, and all gave the best of satisfaction.

Price, with Wooden Whiffletree, \$9. Extra Share, \$3.

LA DOW HARROW.

Just the Harrow for Vineyards.

Thousands in use, giving entire satisfaction. Simple, Durable and Flexible.

Send for Prices and Description.

Weight, 325 Pounds.

It is the only Cultivator that is a perfect side-hill machine. The machine is simply perfect. It is expensively made and great care has been used in its manufacture.

We call special attention to our HAVANA PRESS DRILL. By its use you are assured of an excellent crop. Send for circulars, testimonials and description. Have you seen our New Square Corner Gang Plow? It beats anything in the shape of a plow. Agents for David Bradley's Celebrated Garden City Plows. Send for Catalogue. Address

TRUMAN, ISHAM & HOOKER, San Francisco.

HAWLEY BROS. HARDWARE CO.

SOLE AGENTS FOR THE

CELEBRATED

COLDWATER ROAD CART.

As a Mud Cart it is unsurpassed.
As a Breaking Cart it has no equal.
As a Speed Cart it goes to the front.
It is entirely free from all horse motion.
The spring and seat-bars being on top of shafts gives more horse room than any other cart yet constructed.

We use the best of material in its construction. Shafts, seat-bars, circle-bar and cross-bars are made from the finest selections of second-growth ash and hickory.

For ease and comfort to occupant it goes ahead of any two-wheeled vehicle manufactured in the world.

Patented May 5, 1885.

Owing to its low price, it comes within the reach of all.

The Wheels are Brown's compressed banded "A" wheel.

The Axles are Sheldon's double collar interchangeable steel axle.

The Tire is the best brand—Sweet's tire. The Irons are of the finest malleable and wrought, and forged by the best of skilled workmen.

Our Medium Cart, 7/8 axle, weighs 110 lbs.
Our Two-Passenger Cart, 1 inch axle, weighs 130 lbs.

PRICES GIVEN ON APPLICATION.

Also Agents for the JOHN DEERE MOLINE GANG, NEW DEAL, SULKY and SINGLE PLOWS, South Bend Chilled Plows, Schuttler Farm and Spring Wagons, Perkins' Windmills, Keystone Disc Harrows, ALL KINDS OF LARGE AND SMALL FARMING IMPLEMENTS, HOWE SCALES, ETC.

The Cork Oak.

C. G. Hutchinson of San Gabriel, who owns the large cork oak tree of which an engraving was given in the *RURAL PRESS* some time ago, writes that his largest tree is now very handsome with its evergreen foliage. It is much sought out by tourists, who have seen the acorns and the cork which have been shown at the Chicago and St. Louis expositions, and are desirous to see the tree growing. Mr. Hutchinson has for several years grown quite a crop of acorns, and the University has purchased from him part of the seed from which they have grown the seedlings, which they are distributing in small lots for trial. This year Mr. Hutchinson has also sold some to go to Ventura county and has some left. The Ventura county grower proposes to put out ten acres to cork oaks. Another direction from which the University has procured acorns is Calaveras county, where H. A. Messenger of Valley Springs has old trees. We know of other trees in Visalia, in Santa Barbara and in Sonoma. This makes five counties in which cork oaks of considerable age are now growing, and there are probably other places also. All these trees are from seed sent out by the Patent office about 1855, so the trees are now upward of 30 years of age, and old enough to yield some cork. We would like to know about any other old trees than those mentioned.

The young cork oak seedlings do well without much care, when set out in dry situations. Mr. Hutchinson writes that he set out some two years ago on a hill where there is no chance for irrigation. They were watered by hand when first set out, and have had nothing but the natural rainfall since that time. They are now looking well, and if they get a fair amount of rain this winter, he expects they will make a good growth. Some young seedlings were set out last winter on the hill back of the University grounds in Berkeley, and have done well in spite of the short rainfall. They have had no water at all. The squirrels do not like the cork oak as well as the English oak, apparently, for they have done them little harm, while they wrought great havoc with the latter.

The seedlings are grown easily in nursery or garden-beds. The bluejays have, however, a passion for the acorns, and will dig them out in quantity unless they are covered with lath frames or something of the kind to keep them out. Gophers also like the seedlings and must be watched and destroyed. Now that there are plenty of fresh home-grown acorns to be had, there is no reason why there should not be large quantities of the trees grown and planted. The coming generations in this State bid fair to require large quantities of cork, and we should be planting the trees for them now.

THE BEST EARLY POTATO.—A reader of the *RURAL* asks which is the best early potato for San Luis Obispo county. We would like to have our readers in that county give us the benefit of their experience, and, in fact, we wish our vegetable-growers generally would rise and explain more fully. We have great partiality for this branch of horticulture, and would like to give it more space in our columns, if our practical readers will let us hear from them of their observations and experiences.

ORANGES flourish at Fresno. Harvey Akers of that town will pick 10,000 this season, and the fruit is very large and clean.

The California Fan Palm.

Our indigenous palm, one of the most striking native plants of the State, gave the botanists some trouble in classification. First it was a *Prichardia*, then a *Brahea*, and finally it has

enters Los Angeles from the east by the Southern Pacific sees them upon the left side of the railway just before the station is reached; in fact, the buildings shown in the lower left-hand corner of the picture are those of the railway. These palms are a landmark for the

THE TWIN PALMS IN LOS ANGELES.

found botanical rest as *Washingtonia filifera*. Its native area along the Colorado river was thrown open to the public by the building of the Southern overland route, and is now a comparatively familiar country. Long ago, however, seeds were brought from this region and plants were established which have now grown to grand size, while the facts of their introduction have become a matter of tradition. The twin palms shown in the engraving which are growing within the limits of Los Angeles city, are perhaps the oldest and largest cultivated fan palms in the State. They are probably upward of 50 years old. The tourist who

enters Los Angeles from the east by the Southern Pacific sees them upon the left side of the railway just before the station is reached; in fact, the buildings shown in the lower left-hand corner of the picture are those of the railway. These palms are a landmark for the

tourist, and their photographs are in great request. They are now being encroached upon by the buildings, and may fall before the progress of the day, but we trust they will be spared as long as possible. The California palm was widely distributed over the State at quite an early day. It is on record that Louis Prevost, the pioneer San Jose horticulturist, brought seed from the southern desert to San Jose about 30 years ago, and succeeded in growing about 50 plants. These were carried to all the chief points in the northern half of the State. Either from this, or in some cases perhaps from later propaga-

tions, came the large fan palms which are to be found at points in the Sacramento valley as far up as Shasta county; also in Oalistoga, in Sacramento, Stockton and elsewhere.

The plant is a rapid and vigorous grower and quite hardy. It also bears transplantation well. Some years ago the late Governor Latham bought two old palms at San Jose. They were at the time about 25 feet high, and he is said to have paid \$1000 for the pair. These he moved from San Jose to his residence at Menlo Park, where they grew well and are still standing on the old Latham place.

A Perennial Fair.

Although the State, Mechanics' and various district fairs were all over weeks and months ago, many of the pleasures and advantages of an agricultural exposition can be enjoyed any week-day on Market street, or within a stone's throw of it, by the citizen of San Francisco, the visitor from other portions of the State and the stranger within our gates from the far East.

Let any one who would test the truth of our statement pause before the window of the California Land Association, 634 Market street, and let his eye wander over the big squashes, potatoes, and other vegetables, the specimens of maize and grain, grapes and fruit, citrus and deciduous, nuts and cotton. Let him stroll a few doors further down to Carnall's and Stevens & Morgan's real estate offices, glance at the similar but smaller collections there, and then cross the street to the northwest corner of the Palace hotel and inspect the great Sonoma Valley exhibit, in which the large and elegant assortment of fruits in glass is particularly striking.

All these will make a proper introduction to the varied and fascinating display which is to be seen at the rooms of the State Board of Trade on Second St., under the Grand hotel. Here 14 of the 21 affiliated counties have already placed exhibits of their products, and others are preparing to do likewise. In a hasty glance around on Wednesday of this week, we were struck particularly with the handsome samples of dried fruit from Sacramento county, the glace confections from San Jose (Barbour and Washburn's), the heavily laden boughs of luscious Japanese persimmons from Sonoma, and the superb cluster of (23) oranges from Oroville, Butte county. And we were given palatal evidence that both the 'simmons and the citrus fruit were delicious to eat as well as fair to look upon.

The register kept at the rooms shows the autographs of from 25 to 40 visitors per day from outside the State. We noticed them hailing from Texas and Missouri, from Maryland, New York, Massachusetts, Maine, Canada, and even England and Scotland. How they will spread California's fame abroad!

Should the citizen or sojourner still wish to see more of our State's resources, the Immigration Association, at 10 California street, offers freely to show him a fine array of corn and grains in the sheaf, luxuriant hop-vines and olive-branches in the hall outside its rooms, while within are many specimens of minerals, native woods, jars of thrashed wheat, oats, barley, etc., almonds and walnuts, beans in vast variety, fruits, honey, fleeces, etc.

Taken altogether, the several exhibits above indicated give San Francisco an interesting and quite respectable standing agricultural fair.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

A Deep Bore in Oregon.

EDITORS PRESS:—To one coming from Iowa or Dakota, where on all land water may be obtained by boring or digging with ease, it being found at a reasonable depth on almost every section of country, it is interesting to see the different devices for securing water on the Pacific Slope. Multitudes of Iowa farmers have come to California and secured land without giving thought to the question of water, finding the price of their land quadrupled sometimes before irrigation was secured. While on a long visit to different parts of Southern California, in San Luis Obispo, Los Angeles and their neighborhoods, nothing interested me more than the various devices for securing water on farms, and the marvelous effects produced on the sandy, seemingly barren soil by the flow of water on it. Orange groves, vineyards and fields of grain are growing in richest luxuriance on sandy soil which a dweller on the prairie would consider worthless for cultivation.

Riding through the park in San Francisco one day in February, we saw many men employed in preparing about 40 acres of ground, to receive all kinds of bedding plants, many of them of the most tender varieties. We laughed at the idea of anything growing in soil like that. It seemed pure sand—only fit for mortar. In August we drove by it again and were astonished to find most luxuriant blossoms of every conceivable variety on every part of the tract—dahlias, asters, chrysanthemums on one part and delicate spring flowers on the other, with many kinds unknown to our Northern gardens. "All that sand needed was plenty of water," said the gardener. But the rapidity of growth and its luxuriance was a great surprise.

So with some land in San Luis Obispo and vicinity. Soil that seemed absolutely barren a short time ago is now producing marvelous crops, with no manure or fertilizing material. Land that had cost over \$200 an acre to buy, clear and fence, paid 50 per cent more than the whole cost in its first crop of white beans!

In many parts of California and Oregon, however, water is found on many farms in springs—and surface water; on others, by digging from 20 to 60 feet, never-failing water is obtained, and all modern methods, of course, are used to make this easy of access to houses, barns, dairies and stock-yards.

Among the places where there is no spring or well-water found is one of the farms owned and being improved by W. S. Ladd, the well-known banker of Oregon. We may say here that this man says he waited years with the object ahead to be "able to afford to clear and run a farm," and is now using his farms as his recreation from business and making costly experiments in breaking lands, clearing, cropping, stock-raising, etc.

An Artesian Well.

The one of Mr. Ladd's farms of which we write is near Portland, and upon it he has been for some time sinking an artesian well, which has attracted much attention. I think it will interest some of your geological students, and therefore give you the briefest possible record of the soil as found.

Strata of earth and clayey soil and fine drift sand, 100-ft. level.

Sand, clay and gravel, granite and basalt, boulders in moist sand, 20 ft.; 120-ft. level.

Water-worn boulders and gravel, with veins of water with sand, 90 ft.; 80-ft. level.

Water-worn ground and sand of basalt and granite, 20 ft.; 200-ft. level.

Water-worn boulders and grit of spar and basalt, 20 ft.; 220-ft. level.

Loam, grit and gravel of water-worn basalt and granite spar in veins of sand and conglomeration, 55 ft.; 275-ft. level.

(The presumption is that there is lateral leakage at this point.)

Fine sand and small basaltic gravel, 55 ft.; 320-ft. level.

Coarse grit and sand of granite and spar, 55 ft.; 330-ft. level.

Alternate veins of clay, sand and granite boulders, with water-worn gravel and sandstone, 20 feet; 360 ft. level.

Compact veins of clay, slate and talc containing fine basaltic grit and sand, also lignite and fossil wood and plants, 315 ft.; 720 ft. level. (The presumption is that if packing were solidly placed at upper portion of this section, a flow might be procured.)

Fine grit, sand and gravel of basalt and granite in soft shale, 1 ft.; 730 ft. level.

Marl talc and slate mud, with small basaltic gravel and veins of soft sandstone, 120 ft.; 850 ft. level.

Stiff clay shale and marl with soft talc containing veins of pure basaltic sand, 150 ft.; 1000 ft. level.

Solid and compact veins of white sand and coarser gray sand with mica scales and fine basaltic grit, 8 ft.; 1080 ft. level.

Fine conglomerate containing shale and marl, with fossil plants and sand showing iron stains, 120 ft.; 1200 ft. level.

Coarse basaltic grit and gravel, 50 ft.; 1250 ft. level.

Fine sandy marl and shale mud containing fossil plants and gravel showing iron stains, 50 ft.; 1300 ft. level.

Solid granite, compact archaean rock.

At 166 feet below the surface of the ground

water was obtained, and 220 feet the flow never diminishing.

The geological curiosities found at different depths are of great interest. Silt mud at various depths, and 150 feet below the surface in this mud is found embedded bark and limbs from a tree, solid wood.

There was also found shale of the coal period, claimed to overlay petroleum, also giant tree-bark of the coal period and bark of fern of the carboniferous age, and also conglomerate of the coal period.

Most curious of all to me was the seed of pine cones found many feet below the surface of the earth, and two qualities of rock 1200 feet below.

The man who is sinking this well under contract for 2000 feet is now employed by the Government on another at Vancouver. How much nearer Asia than the 2000 feet Mr. Ladd will employ him to bore, we shall know in the near future. The work already done is full of interest to all geologists, as well as to the owners of land here.

Some items of Mr. Ladd's clearing his farm, success with hedge plants, fencing, etc., will be given in future letters.

Portland Or.

THE FIELD.

Distribution of Seeds and Plants.

University Experiment Station Bulletin, No. 76.

The distribution of seeds and plants from the University Experiment Station is each year commanding wider attention. The distribution, last year, as shown in detail in Bulletin No. 68, included shipments to upward of 630 individuals, and the geographical area covered is indicated by the fact that the material was sent into nearly all the counties of California, and to more than 600 post and express offices.

It will be noticed that we offer this year a greater number than ever before of growths received by us from the Department of Agriculture at Washington. Many of the seeds from this source have given much promise by their success in the University garden, and by our system of distribution we believe we can more readily transmit them to those who are disposed to test them carefully and intelligently than can be reached by the usual method of political dissemination. Hon. N. J. Colman, U. S. Commissioner of Agriculture, in his report to the present Congress, advises that future seed distribution be through the agency of the State Experiment Stations, and we believe such an arrangement will be productive of the best results. We have labored hitherto, in anticipation of a closer relationship with the U. S. Agricultural Department, to show what can be done to promote local experimentation under local guidance, and it is expected that when the new law establishing Experiment Stations shall be made effective by the appropriation of funds to carry out its provisions, the work of introduction and distribution of promising seeds and plants will be greatly facilitated and advanced.

As has been described in previous bulletins, this distribution is made for the purpose of ascertaining the adaptation and practical value of the several kinds in the different climates and soils of the State; and persons receiving them are requested to report results, whether success or failure, and if the latter, from what apparent causes.

Terms.—As there is no appropriation available to meet the expenses of packing and postage, applicants are requested to send the amounts specified in connection with each description below. If they desire seeds sent by express, applicants need not send the amounts specified for postage, but all orders for seeds by express must be accompanied by a remittance of ten cents to pay for packing. Applications may be made for one or more kinds of seeds. In case any kind of seed becomes exhausted, the money sent will be returned unless a second choice is mentioned by the sender.

Plants will be forwarded by express (unless specially otherwise requested), in lots consisting of the number hereinafter mentioned for each kind, on remittance of 25 cents for each lot of plants, and ten cents additional for each additional lot, to pay expenses of packing, etc. Postal notes are requested to be sent in lieu of stamps whenever practicable. Any surplus left after filling orders as far as possible will be returned to the senders, deducting letter postage.

Cereals.

Hessian Fly-Proof Wheat.—The repetition this season of our experiments with resistance of wheat varieties to attacks of the Hessian fly (*Cecidomyia destructor*) affirms the value of the kinds distributed last year, and leads us to urge them for trial in infested districts. The Missoyen wheat on our poor soil and with the deficient rainfall of 1887 yielded at the rate of 33 bushels to the acre, while other non-resistant wheats adjacent were killed outright or reduced to a fraction of a crop by the fly. The Atlantic wheat yielded over 27 bushels, and the Volo at the rate of 20 bushels per acre. These varieties are solid-stemmed and were originally dark, hard wheats, but are fast becoming white and starchy, but do not so far sacrifice their resisting qualities. Applicants will be furnished with one pound of each of the three varieties (1) Missoyen, (2) Atlantic,

(3) Volo], or a single pound of each variety. Send 20 cents for each pound ordered, if to be sent by mail.

Indian Corn.—A collection of maize received from the U. S. Department of Agriculture included some varieties which did very well even under the local conditions of Berkeley, which are not at all suited to this grain. We distribute them to be tested in other localities, where the summer heat is usually too low for corn, as well as in the best corn districts of the State. The varieties are as follows: The soil requirements mentioned are given on Mexican authority.

1. Mosby's Improved Prolific.
2. Fine Pigeon Corn (Mexican)—for sandy soils.
3. Cacahuazintle (Mexican pastry corn) for poor soil.
4. Chalco (Mexican go-day corn).
5. Lezma (Early Mexican Yellow) for poor soils.
6. Early Black, for poor soil.
7. Early Minnesota Sweet; dwarf sort; fine.
8. Early Sugar; dwarf sort; fine.

Seed of these varieties will be sent, as long as the supply lasts, in 3-oz. packets of each variety at 5c. each. Applicants may order one or more kinds.

Berkeley Hybrid Barley.—A two-rowed, beardless variety, which originated in a small plot of Scotch two-rowed barley on the University grounds in 1882, when Mr. W. G. Klee, then head gardener, found two heads of what he considers the true type, viz: two-rowed and slender ears, appendices to awns three cleft, as with the Nepal barley; hull adhering to the seed. All the kernels of these two heads were sown next season in the University garden. There was found considerable tendency to variation, probably 12 per cent being untrue to type in having beards or six rowed heads. The grain has been grown each year since that time and care taken to pull out all heads not true to type before blooming. Afterward all heads were picked over and all grain shelling out was rejected. The tendency to variation has decreased from year to year, but still exists to a certain extent. We propose to continue the selection of true heads in our sowing here, and would like to have the variety tested by barley-growers, for yield, quality and hardiness. We imagine it will be found of chief value as a hay grain. Seed will be sent by mail in 1-lb. bags, 20c. each.

Oats.—A large sowing of oat varieties was made in 1887, partly because the oat does not harbor the Hessian fly, and also with the object of testing the rust-resisting power of the varieties. It did not prove a "rusty year," so no data on that point were gained. The following varieties gave the best yield on the Experimental Grounds this season, and are offered for test in the out districts of the State:

- | | |
|---------------------|---------------------------|
| 1—Black Tartar | 5—Hopeton |
| 2—Canadian | 6—Early Black (Ft. Imper) |
| 3—Hallet's Pedigree | 7—Harris (from Alabama) |
| 4—Polish | 8—Late Silesian |

Applicants will be furnished with one pound of each variety, or of either variety; send 20c. for each pound ordered.

Trees and Shrubs.

The Camphor (Cinnamomum camphora).—In many parts of California this tree has proved a hardy and a rapid grower. It is a very handsome evergreen, and likely to prove valuable in this State, both as a source of gum camphor and for timber; also very satisfactory as an ornamental or shade tree. Trees planted late last spring on the dry hill east of the University site survived the unusually dry summer. Squirrels seem to have no use for the camphorated foliage. A fine lot of seedlings were donated by A. Chabot, Esq., of Oakland, and will be sent in lots of five to each applicant; 25c. for each lot.

Cork Oak (Quercus suber).—Seedlings from acorns obtained from trees about 30 years old in Los Angeles and Calaveras counties. There are now bearing cork oaks in at least five counties of the State. The failing supply abroad and the immense prospective demand for cork in this country make it a duty to plant cork oaks for the use of the coming generation. It seems a very promising investment, too, for future benefits. Small trees, two to each lot, 25c. per lot by express.

The Strawberry Tree (Arbutus Unedo).—The true madrone of Spain: A near relative of our native madrone (*Arbutus Menziesii*). The strawberry tree is an ornament to any garden, while its sweet berry, very much resembling in appearance and taste the strawberry, might make it profitable fruit. Our stock is small: One tree to each lot; 25 cts. per lot by express.

Kikar (Acacia Arabica).—The true gum arabic tree, seed of which we obtained from the Department of Agriculture, Cawnpore, India. Will not stand frost and is only fit to plant in thermal belts. We have but a small stock and will send only where evidence of a frostless situation can be given. Four trees to each lot; 25 cts. per lot by express.

Black Wattle (Acacia decurrens).—We have saved a good lot of seed of this promising tree and desire to secure its general introduction. The seed is small and a 2-oz. packet properly handled should give trees for a large plantation: Five cents per packet by mail. In some cases a large amount of seed will be furnished.

Guavas.—We have a few plants of the strawberry guava (*Psidium cattleianum*) a hardy species. Two plants to each lot; 25c. per lot by express.

Date Palms.—A small number of seedling date palms from seed produced by the late E.

Von Borstel of Lower California will be sent to localities where the conditions seem to favor the plant. It is possible some of these seedlings may prove especially adapted to California. Mr. Von Borstel succeeded in securing early ripening varieties and furnished us seed from them. We wish to place the trees in careful hands. Two plants to each; 25c. per lot by express.

Melon Tree (Carica papaya).—Plants grown from seed of a fruit procured from Mexico by G. P. Rixford. The growth and fruiting of this tree in San Diego (as described in our last annual report, page 116) and elsewhere in frostless situations in this State commend it for trial in strictly thermal belts to determine how far it will prove hardy. It is highly ornamental in form and in bloom and its fruit very desirable. We have but a small stock and reserve the right to place them only in what seems to us promising situations. Two plants in each lot; 25c. per lot by express.

Silicium Sumac (Rhus coriaria).—This is the true tanners' sumac of which large importations are made from the Mediterranean region. Our plants have matured seed this year. We will send seed, 2c. per packet; or rooted plants, two to each lot; 25c. per lot by express.

The Tea Plant.—Seedlings grown from Japanese seed and donated by A. Chabot, Esq., of Oakland. Tea plants thrive in many parts of California, and in some cases the leaves are gathered for home use. We can furnish a limited number in lots of three plants each; 25c. per lot by express.

Grasses and Forage Plants.

Schrader's Brome Grass (Bromus unioloides).—This grass is fully discussed in our last annual report. It is proving valuable in many situations and should have farther introduction in new localities. Seed in 3-oz. packets; 5c. each by mail.

Hungarian Brome Grass (Bromus inermis).—Also a promising grass deserving wider trial. Seed in 3-oz. packets; 5c. each by mail.

Many-Flowered Millet Grass (Milium multiflorum).—Our correspondents speak very highly of this grass and others should try it. It seems best adapted to the warmer parts of the State. Seed is very small; 1-oz. packets; 2c. each by mail.

Yellow Millo Maize.—This is a variety of sorghum. The seed is donated for distribution by E. A. Bonine of Lamanda Park, Los Angeles county. Mr. Bonine has tried this variety in comparison with "white millo-maize" and with "Kafir corn," and considers it much superior to either in yield of seed and fodder. Seed in 3-oz. packets; 5c. each by mail.

Snail Clover (Medicago turbinata).—An annual starting in to grow early, making a dense growth and covering the ground thickly with pods twice the size of burr-clover pods and smooth, so that they will not cling to the wool of sheep. Preliminary trials indicate considerable value. Seed in 3-oz. packets; 5c. each by mail.

Black Medic (Medicago lupulina). The growth of this plant without water, in the University garden, and in other situations where it has taken root, commands it highly for wider trial. It is a persistent grower, and makes a deep and dense mat of foliage. Seed in 1-oz. packets; 2c. each by mail.

Tagasaste (Cytinus proliferus albus).—This is a leguminous shrub from the Canary islands, where it furnishes much pasturage on dry hill-sides. In the University garden it has grown to 10 feet in height, and is apparently overgrown under too kind conditions, though it has had no water. It should be tried on dry hill-sides, where it may prove more nearly what Baron Von Mueller describes it, "a tall herb, recommended as a fodder plant in countries exposed to drouth." We would especially like to have it tried on sheep and goat ranges. Pour hot water on seed and let stand 12 hours before planting. Seed in 1-oz. packets; 2c. each by mail.

Salt Bushes (Atriplex sp.).—Our last report (p. 93) contains quite contradictory reports as to the value of these plants, which are especially recommended for saline soils. They are found to be of great value in Australia in such situations, and some California growers speak well of them. We have a good lot of rooted plants, which we send in lots of 5 each; 25c. per lot by express.

Fiber Plants.

We offer again the fiber plants of which quite a number were sent out last year:

New Zealand Flax (Phormium tenax).—Grows well in the coast regions of the State. Valuable for tying plants, vines, etc. Five plants to the lot; 25c. per lot by express.

Esparto Grass (Stipa tenuissima).—Grows well on sandy beaches within reach of salt water, and in some other situations. Used for cordage, basket-weaving and paper-making. Ten plants to the lot; 25c. per lot by express.

Ramie (Boehmeria candicans).—The famous "China grass." Several processes are now being advocated as successful in extracting the fiber, and some foresee an important industry resulting therefrom. Ten plants to the lot; 25c. per lot by express.

Fiber Flaxes.—Four varieties of *Linum usitatissimum*, grown in Europe especially for fiber; reach twice or thrice the height of the kind commonly grown for seed. Seed of one or more varieties in one-pound sacks; 20c. each by mail.

Grapes: Roots and Cuttings.

The Wild Arizona Vine (Vitis Arizona).—To those residing in regions already infested

and wishing to test this resistant stock in new situations we will send rooted vines thoroughly disinfected. Five to each lot; 25c. per lot by express.

Huasco.—The raisin grape from Chile. Though the value of this variety as compared with the Muscat is not fully established, it appears that in some situations it is especially good. Cuttings by mail 15c. per bundle of 12.

Asiatic Vines.—The peculiar appearance of these vines (*Vitis Romaneti* and *Spino-vitis Davidii*) and the interest which pertains to their undetermined value in this State makes them desirable to amateurs and experimenters. Cuttings by mail, 15c. per bundle of 12.

Miscellaneous.

Chick-pea (*Cicer arietinum*).—This is a variety of the species which is so highly esteemed in France and other countries of Southern Europe for the same purpose as the lentil. It is the basis of the *puree aux croutons*, so popular in Paris. Cultivated like other peas, the pods being gathered before the seeds are perfectly ripe. Sent in 1-oz. packets; 2c. each.

Chuna.—Another variety of chick-pea brought from East India in 1886 by Miss Luella Kelly and donated to the University by R. E. Wood of St. Helena. It is a brown seeded variety. The seeds are eaten by the natives in curries, cakes, etc., and are also very fattening for cattle. Sent in 1-oz. packets; 2c. each.

Quinoa (*Chenopodium quinoa*).—The seed of this plant has been offered to California experimenters for several years, but does not attract much attention. The plant is highly esteemed in Peru and is favorably mentioned by travelers. The seed is used for food, being prepared for the table as beans are. It is also possible that it would be of value for poultry and stock. It should have a wider trial. Sent in 1-oz. packets; 2c. each.

Buckwheat.—We have two varieties from the Orient, one called "Asiatic," the other "Chinese." They differ from the common variety in having a very long growing and blooming season, which may render them of special value to beekeepers to provide winter stores for the bees, even if the honey is too dark for sale. In yield of grain they are probably no better than the common kind. Sent in 1-oz. packets; 2c. each.

Pumpkins and Squashes.—Seed of the following varieties was received from the Department of Agriculture: (1) Pumpkin Cashaw; (2) Mammoth Tours; (3) Calabaza, a Mexican variety of pumpkin squash; (4) Cashaw squash. These varieties grown on the University grounds seem to commend themselves for trial over a wider area. Seed of each or all kinds in 1-oz. packets; 2c. each by mail.

Bamboos.—A limited number of applicants can be supplied with bamboo plants of two species: (1) the Ringal (*Arundinaria falcata*), a small-cane species, very ornamental for a large lawn; (2) the *Metake*, medium-sized canes. Our larger cane species are not available for distribution. So far as the stock goes, we will send one plant of each kind in each lot; 25c. per lot by express.

Tobacco.—We have grown the past season a fine collection of tobacco varieties of which seed was received from Washington. Although the industrial value of the plant in California must still be regarded as undetermined, because of the failure of curing processes, the seed is offered to any who are disposed to grow the plant for experiment or for use as an insecticide. We have 20 named varieties, of which we will send seed by mail in small packets at 2c. each variety.

Insect Powder Plants (*Pyrethrum cinerariaefolium* and *roseum*). The former has the stronger insecticide properties; the latter beautiful flowers. Seed of the former in 3-oz. papers, 5c.; the latter in small packets, 2c. each.

Fruit-Tree Scions.

The University orchard contains upward of 500 named varieties of fruit, and our report of 1886 contains, on pages 130 to 140, tables in which are succinctly recorded observations on apricots, apples and pears, growth of tree and quality of fruit, time of ripening, keeping quality, etc. These observations cover a series of years and indicate that some varieties are worth a trial in other parts of the State. Applicants may order any of the varieties named in the report. We do not furnish rooted trees but scions for grafting. We do not send large quantities of any variety, because the object is to test varieties and not to furnish material for commercial propagation. Send 10c. for each dozen ordered.

N. B.—All applications for seeds and plants should be made as early as possible. We expect to send out seeds about January 1st and plants about February 1st. All applications should be addressed to E. W. HILGARD,

December 10, 1887.

Berkeley, Cal.

LARGE PLANKS.—The Vicksburg Herald says: "The statement that the Illinois Club of Chicago has the largest table ever made from a single plank is a decided mistake. In the St. Cloud palace, the old home of Josephine Bonaparte, six miles east of Paris, is a round table of solid oak in one piece, 6 inches thick and 16 feet in diameter, from the Otaheite islands. There is a yellow cotton-wood near Ochotaw Landing, Miss., five miles east of Rolling Fork, that measures 33 feet in circumference, 9 feet from the ground, is 11 feet in diameter, and one on Holland's bayon, three miles east of Anguilla, 35 feet around."

SHEEP AND WOOL.

The Tariff Question.

The woolmen are getting thoroughly aroused over the President's message in its relation to the wool industry. The telegraph brings news of the way the representatives of the wool interest in Washington received the message.

Action in Washington.

WASHINGTON, Dec. 7.—At to-day's session of the conference of wool-growers and wool-dealers of the United States the following was unanimously adopted:

The wool-dealers and wool-growers of the United States, representing a capital of over \$500,000,000 and a constituency of a million wool-growers and wool-dealers, assembled in conference, have read the first annual message of the President to the Fiftieth Congress, and declare that the sentiments of the message are a direct attack upon their industry, one of the most important of the country, and in positive violation of the national Democratic platform of 1884 as interpreted by the party leaders and accepted by the rank and file of the party. The argument made by the President for the removal of our protection against foreign competition is one repeatedly made by the enemies of our industrial progress and effectively answered in nearly every school district of our land, and so thoroughly disproved by the logic of facts and the demonstration of experience and history as to need no answer from us.

We had the right to expect something different from the Chief Executive of a nation the most happy, prosperous and contented of any of the world, made so by the policy of protection and development which he now seeks to destroy. We had the right to expect our President would favor the wool-growers of the United States, and confess our deep disappointment that instead he favors the interests of our foreign competitors. We make an appeal from his recommendations to the seven and three-fourths millions of our fellow-citizens engaged in agriculture; to the millions engaged in manufacturing; to the army of wage-earners, to tradesmen and merchants, knowing that their judgment and decision will be based upon justice and patriotism, and will therefore favor the maintenance of the American policy of protection, to which the country is indebted for its unexampled development and prosperity.

"If the whole amount of revenue derived from wool was abolished, it would reduce the surplus only about \$5,000,000, or less than 10 cents per capita of population, which is paid by foreigners, while the old war taxes he recommends we retain yield over \$119,000,000 and is a direct tax per capita of \$2 each. The total revenue derived from imports of wool under the tariff of 1867 was less than \$17,000,000, and under the reduced tariff of 1883 the revenue last year was only \$5,000,000. The number of sheep in the country in 1884 was 50,626,626, and in 1887 44,759,314, a decrease of nearly 6,000,000, and the diminution of the annual wool product was over 35,000,000 pounds, thus showing that the reduction of tariff by the Act of 1883 has decreased the revenue from imported wool and diminished the number of sheep in the United States about 12 per cent. The President's policy would bring about the destruction of this industry, and the same policy of reduction or abolition of the tariff would end in disaster to all other industrial and productive enterprises of the country."

Senator Chase of Rhode Island thus concisely sums up the President's recommendation for the repeal of the tax on wool: "The President says that the consumer of wool has to pay for the clothing that he buys, a price that is increased several times by the duty on wool, and that this is oppression of the people. There are now in this country, in rough numbers, 100,000 flock-owners, who own over 3,000,000 sheep, and produce 325,000,000 pounds of wool, worth \$120,000,000. That wool is a very important product of the world. Take off the duty on wool, and probably one-half of those flockholders would go out of business, slaughter their sheep, and turn their attention to other affairs, thus reducing the product one-half. The effect of this would be to make wool scarce in the markets of the world, and the price would necessarily advance, the increase being greater than the duty. But men who gave up wool-growing would have to turn their attention to something else, agriculture probably, and increased competition would reduce the profits of that branch of industry."

A Meeting in San Francisco.

A meeting of woolmen was held December 8th at the office of Christy & Wise, at which were present P. B. Flint, C. S. Moses, G. Ball, J. H. Wise, John Shober, F. P. McLennan, Samuel Wilkenson, R. F. Parks and others. The following resolutions were adopted and ordered telegraphed to the California Congressional delegation:

And, whereas, a general revision and a reduction of the tariff by Congress, now in session, is contemplated; and, whereas, the wool interest of this State is very extensive and one of its chief industries, producing forty millions of pounds last year; therefore, be it

Resolved, That any reduction in the tariff on wool would seriously cripple this industry and greatly decrease its production in this State, because our wool-growers cannot compete with the cheap labor and cheaper ranges of foreign countries without the protection which the tariff affords.

Resolved, That we appeal to Congress neither to

repeal nor reduce the tariff on wool, and we hereby request our Senators and Representatives in Congress to use their united efforts to maintain it.

Resolved, That we extend to the National Wool-Growers' Association our hearty co-operation in their endeavors to continue the present tariff on wool.

P. B. FLINT, President,

CHAS. H. ABBOTT, Secretary.

A Meeting Called in Sacramento.

A meeting of the wool-growers and dealers of Sacramento, Yolo, Solano and Placer counties has been called to meet at Grangers' hall, in the former city, on Monday, December 19th, at 11 A. M., to consider and take action on the tariff question.

Other Action at the East.

WASHINGTON, Dec. 8.—The wool growers and dealers were in conference to-day, and passed a series of resolutions declaring unjust the present classification of wool by the railroads of the country, and directing that they be urgently requested to place wool in their new classification on a basis that would at least be equal to the present classification. They also passed a resolution declaring that recent events have demonstrated the necessity for a central organization at Washington or elsewhere, and request all wool-growers and officers of wool-growing associations in the United States to immediately send their address to Albert Chapman, at Middlebury, Vt.

THE PUBLIC LANDS.

Land Grants and their Forfeiture.

Hon. L. Q. Lamar, recently Secretary of the Interior, but now Judge of the U. S. Supreme Court, submitted at the opening of the present session of Congress his report upon public land affairs, from which we take the following concerning land grants to railways:

The legislation by which these vast territories passed under the dominion of railroad companies gave an incurable wound to the homestead scheme before that scheme had a fair opportunity of displaying its beneficent effects. This land-grant legislation was certainly not in harmony with the theory of the distribution of the public domain among the people, and gave up to capitalists, as a basis for traffic and speculation, and gigantic financial schemes, what was, by the original policy of the Government, designed as homes for an industrious and thrifty people, and abodes of domestic happiness and virtue. Notwithstanding these indemnity withdrawals were made exclusively for the interests of the company, few of these, if any, constructed their roads within the time prescribed in the granting Act as an express condition on which the grant was made. Maps of "probable," "general," "designated," and "definite" routes of the roads were filed with rapidity in the Department, and the withdrawals thereunder asked and almost immediately granted, until the States and Territories were gridironed over with railroad grants and indemnity limits, and in many instances the limits of one road, overlapping and conflicting with other roads in the most bewildering manner, so that a settler seeking a home could scarcely find a desirable location that was not claimed by some one or perhaps two or three roads to which grants of land had been made. Though the desired tract might not be apparently covered by a railroad location, a settler would hardly select it before the agents of corporations would set up a claim to it, or the right to occupy and denude it under the right of way and construction privileges conferred by the granting Act. Thus the settler, ignorant of his legal rights, and no one to advise him with respect to either the law or facts, would for the sake of peace readily consent to purchase from the company. In this way these corporations, in addition to the lands granted to them, have claimed, sold and received the price of a great deal of other land to which they had neither a legal nor a moral right. The confusion, hardship and impositions practiced upon settlers were greatly increased by bold schemes by separate agents where withdrawals were made of lands to which the legal title of companies had not attached, and which afterward remained in the same condition for years through the failure of Congress to make the necessary appropriations for surveys.

When, however, through partial surveys or adjustments of grants, the lands thus sold by a company were found to be outside of the grants, and determined by the department to be public land, the purchaser from the company found himself in the unfortunate predicament of having lost both his land and his money, generally without means to enter into a costly litigation with a powerful corporation. The deprivation of his home, the expenditure and waste of his years, his energy and strength in redeeming that home from its wild condition, rendered his mere technical right of action against the company but little more than a mockery. Years have elapsed since many of the grants have been made, and other years since the withdrawals. Some of the companies have constructed the entire line of their roads; others, fragmentary portions only, and others, again, none at all. But the withdrawals of lands were no less effective as a barrier against the settler in one case than in the other, it mattered not what might be his equities acquired by years of toil upon what he believed part of the national domain.

It was declared by the highest judicial

tribunal, as expounded by the highest law-cers of the country, that a withdrawal once made by a competent authority was legal and effective to exclude all from intrusion within its limits. One such case where hardship and injustice were about to be inflicted under the law came under observation. Guilford Miller settled upon lands afterward selected and claimed by the Northern Pacific Railroad Company to be within withdrawal limits for indemnity purposes. Some doubt arising as to the legality of that withdrawal, the case was referred by this department to the Attorney-General for his opinion. That officer held that the withdrawal was legal, and that during its existence Miller could acquire no right or title to the tract claimed by him on which he lived.

While recognizing the correctness of the law, the injustice of the case was seen, so far as this individual settler was affected, and hundreds of others were similarly situated who might and would be affected, and it was directed by the President that such grants should be so administered by this department if possible, to protect these settlers from such injustice, the President stating his belief, "That this can be done under the provision which declares that these selections shall be made under the direction of the Secretary of the Interior." After years of waiting Congress has failed to empower the department to make the necessary surveys whereby some of the grants might be adjusted and no immediate prospect of such survey was in sight, but a law passed March 5, 1887, whereby the Secretary of the Interior was "Directed to immediately adjust each of the railroad land grants made by Congress to aid in the construction of railroads." With an earnest desire to obey the mandate of Congress to grant corporations their every right under the laws and at the same time follow directions given by the President to see that ample protection should be extended to settlers and those seeking to make settlement on public lands, I entered upon the most careful consideration of the whole subject of land grants, and concluded that if the department was clothed with authority to make indemnity withdrawals, as has been done in so many instances, the exercise of that authority was a matter entirely within sound discretion, and not a matter of legal obligation in any respect; and the same sound discretion which, in the interest of the companies, justified said withdrawals, now demanded a speedy revocation of the same, and that the most effective way of expediting an adjustment of land grants and doing exact justice to the companies, guarding and promoting the interests of settlers also, was to permit the public to enter into competition with the companies in the selection of land heretofore withdrawn for indemnity purposes.

Accordingly, on May 18, 1887, with the approval of the President, rules were served upon different companies, for whose benefits withdrawal had been made, to show cause by a certain day why said withdrawals should not be revoked. Some of the companies failed to show cause. Others filed answers assenting to the revocation, as they had received satisfaction from their grant. Others assented on condition that the lands covered by the selections already made should be excepted from the order of revocation, and other companies objected to the order of revocation as being illegal and a violation of chartered rights. Briefs were filed and oral arguments accorded to counsel of such companies as desired to be heard, all of which were fully and carefully considered as was due to the importance of the questions and the magnitude of the interests involved. On August 13, 1887, my views were fully expressed in a decision rendered in the case of the Atlantic & Pacific Railroad Company, which by answer and argument raised nearly all the objections that were presented in part only by a number of other companies. Two days later orders withdrawing the land within the company's limits and reserving the same from settlement were revoked and the lands restored to the public domain and settlement.

The amount of land restored to the public domain through orders revoking indemnity withdrawals is stated by the Commissioner of the General Land Office to be 21,323,600 acres.

WHEAT IN AMERICA.—Concerning the introduction of wheat into America, reliable information is obtainable. It may be difficult in the present day to realize the fact that wheat was at one time unknown in America; yet prior to the discovery of this continent by Columbus, there was no cereal in America approaching in nature to the wheat plant. It was not until 1530 that wheat found its way into Mexico, and then only by chance. A slave of Cortez found a few grains of wheat in a parcel of rice and showed them to his master, who ordered them to be planted. The result showed that wheat would thrive well on Mexican soil, and to-day one of the finest wheat valleys in the world is near the Mexican capital. From Mexico the cereal found its way to Peru. Marie D'Escobar, wife of Don Diego de Chauves, carried a few grains to Lima, which were planted, the entire product being used for seed for several successive crops. At Quito, Ecuador, a monk of the order of St. Francis, named Fra Jodosi Bixi, introduced a new cereal; and it is said that the jar which contained the seed is still preserved by the monks of Quito. Wheat was introduced into the present limits of the United States contemporaneously with the settlement of the country by the English and other European settlers.—*Milling World*.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Objects of Life.

Among the interesting exercises with which Sacramento Grange celebrated the birthday of the Order was an essay read by W. S. L., Daniel Flint, in answer to the question: What are the objects of life, or, for what are we living? By request of the Grange, it was sent to the *Patron* for publication, and appeared in the last issue of that paper. We give a few of the closing sentences; and if our readers like the taste, they know where to get the good thing entire.

"We are not only living for to-day, but our acts and examples will live on and be quoted and commented upon by those that shall come after us. Can we say that no responsibility rests upon us? Shall we pass from this busy, active life without leaving some recompense for the great benefits that we have been permitted to enjoy? Do not let us shirk the responsibility that belongs to each individual. Let us feel that our existence and personal efforts were necessary for the accomplishment of some of the great schemes of human progress. Do not let us shield ourselves behind the flimsy excuse that we have no influence, are not gifted with a ready tongue or commanding appearance, and silence and obscurity are more befitting our station in life. It is said nothing was created in vain.

"Likewise there is a place for everything, and everything should be in its place. As bodies float in liquids according to their density, so individuals hold their station in society according to their supposed merits. The Creator has distributed the human race throughout the land, and with a wise purpose has assigned something for all to do. Do not stand with your arms folded and your voice silent, because you think some of the members are a little more accomplished than yourself. That is just the reason why you should apply yourself with more vigor to equal if not surpass all friendly competitors.

"If you cannot be that majestic orb whose nod commands the world to rest, and whose morning beams summon again to busy life, you may be some beacon light on a stormy coast that guides the mariner to a harbor of safety."

What the Farmers Ask of Congress.

"Sentinel," the special correspondent of the *Farmers' Friend* at Washington, speaking of the late session of the National Grange at Lansing, says: In language not to be misunderstood, in a dignified way, without bombast or bluster, that National assembly of representative farmers asks of Congress:

1. That the Oleomargarine law shall not be repealed.
2. That the Interstate Commerce law shall remain.
3. That the Patent laws shall be revised.
4. That U. S. Senators shall be elected by a direct vote of the people.
5. That Tariffs on raw materials shall not be reduced while existing Tariffs remain upon manufactured goods.
6. That the Commissioner of Agriculture shall be made a member of the President's Cabinet.
7. That reforms looking to lower rates of postage shall be inaugurated.
8. That the Hatch Experimental Station bill shall be perfected, and the money appropriated be spent in sustaining stations distinct from the so-called agricultural colleges.
9. That laws be passed prohibiting gambling in farm products or dealing in "futures."

The National Grange.

In Worthy Master Darden's opening address at Lansing last month, he said:

The progress made in the work of our Order since we last met in annual session is commendable and gratifying. Success has attended the efforts of our lecturers, as shown by the large number of dormant Granges that have been revived and by the establishment of 174 new Granges—an increase unusual if not unparalleled in an institution as old and well established as the Grange. The State Grange of Nebraska has been re-established, and we have the pleasure on this occasion of welcoming Brother O. E. Hall, her worthy representative, to our meeting. We also have the pleasure of extending fraternal greetings through Brother Peckham, the W. M., to Patrons in Rhode Island who have recently fallen into line with this farmers' movement, thus completing the circle of States, and making the Grange in deed and in truth a grand National organization.

We were hoping to give some account of what was said and done at the recent session of the National Grange beyond the points mentioned in our issues of Nov. 26th and Dec. 3d; but the pressure upon our columns proves too great, and we must refer those desirous of learning further particulars of what transpired on that interesting occasion to the extended reports published in the *California Patron*.

GRANGE ITEMS.—Wheatland had a delightful meeting Dec. 21, and W. L., Frank Kirchner delivered a fine lecture. . . . Worthy Sec. Skaggs reports Point of Timber as gaining strength and

numbers with more candidates on the way. . . . Bro. Huffman of Lodi has got home from Lansing, Mich., where it will be remembered he had charge of the San Joaquin exhibit. He found the Eastern people greatly interested in California. . . . Enterprise had a good time celebrating the Grange birthday, conferred the 3d and 4th degrees upon a class, discussed a Feast and voted on three candidates. . . . Tulare, as had been promised, was favored on the 3d inst. with an excellent lecture by Dr. Stratton on "The Signs of the Times."

Grange Work and Progress.

[Prepared by M. WHITEHEAD, National Lecturer.]

As the end of the year draws near it is fitting that our work of the past 12 months should be reviewed, its successes noted, and new courage and hopes inspired for the future. The reports made at the late session of the National Grange were full of encouragement. Some of them will be given here, with a few kind words from the friendly press of the country, which will show that the Grange is now considered a success and a permanent institution, commanding the respect that its principles and its work so well deserve.

W. H. Stinson of New Hampshire, A. S. N. G., said in his annual report:

The unity and fraternity of the Grange has been apparent everywhere, whether knocking at the doors of Congress or State Legislatures for the enactment of righteous and honest laws, or more quietly in its social and educational work at our frequent meetings, or at our homes and around the fireside circles.

To every thoughtful Patron it is evident that the Grange has brought more sunshine and good cheer to the agricultural classes of our country than any other association of similar design in this or any other day or generation.

From the hills and valleys of New England westward to the Golden Gate, through the sunny Southland to the famed Northwest, come the proofs of the Order's ennobling, elevating and educational work. No other institution or agency has brought forth such noble returns of fraternal work in doing away with sectional divisions, unjust suspicions and bitter antagonisms that grew out of the war between the North and South. Confidence has returned, the grasp of friendship and good-will is given; the Blue and the Gray meet here on common ground, under one flag, standing shoulder to shoulder for Union and liberty.

I. G. Hale, W. M. Connecticut S. G., in his report said:

Holding our membership in all Granges in the State, and making moderate gains in most of them, and with the organization of 21 new Granges, we have added more than 1000 members to the Order within the past year—a gain of about 60 per cent; three Pomona Granges with a large membership in each. The organization of a State Fire Insurance Company, marvelous exhibits at State, county and town fairs, tell to some extent the story of our work in Connecticut, and this has been done without excitement, but by simply following Grange principles, especially the first plank in our Grange platform. . . . Trying "to develop a higher standard of manhood and womanhood among ourselves" in the older Granges has so elevated the standard of the former in that immediate vicinity that it has become infectious; and the Grange in Connecticut has become such a power for good that doubting ones are fast coming over to us, and more will follow, just as long as we continue to make the educational and social feature the leading part in all our work.

Our relations with all other agricultural organizations are of the most cordial character, and we are working together in every possible way for the advancement of the cause of agriculture.

Ex-Gov. Robie, W. M. Maine S. G., said:

The Order in the State of Maine continues to move along on an upward grade. There have been eight new Granges organized, and several dormant Granges have been reinstated, and one Pomona Grange has been organized during the past year. We have in each and every county in the State a flourishing and efficient Pomona Grange, and there are 209 active Subordinate Granges, most of them doing good work, and our actual active membership exceeds 15,000. There has been a growing interest in Grange work during the year, and our accessions of late come from the younger members of the farmers' families. There have been 12 new Grange halls built and dedicated during the past year, and as many more are in the process of construction. The Grange halls in Maine are very numerous, costing from \$1000 to \$5000, and it is a strong element of our success. Leonard Rhone, W. M. Pennsylvania S. G. said:

It is a source of great pleasure to note an improved condition of the Order in the State since my last report. . . . We have organized 27 new Granges, with an aggregate charter membership of 648, and reorganized nine dormant Granges, with an aggregate membership of 145, making a total increase of 2160 members. . . . Quarterly reports and payment of dues have been more prompt than heretofore, and our income from this source will show an increase of \$500 above that of 1886, and \$700 above that of 1885.

H. Hawkins, W. M. Alabama S. G., said:

A few in Alabama remained true and steadfast, and to-day are living monuments to the undying principles of the noble Order we have met to perpetuate. I am happy to be able to re-

port that, with brighter hopes than for many years in the past, we have commenced to rebuild the Grange temple in Alabama, and this time on a solid foundation. Our work is progressing not rapidly but steadily, as is evidenced by the fact that we are 13 Granges stronger now than we were one year ago.

W. R. Williams, W. M. North Carolina S. G., said: The Grange in North Carolina has been on the upward grade for the last year; but within the last three months a real boom has set in. Now we have two new Granges to report and 55 reorganized during the year, making 70, and at least 1000 more members than last year.

J. N. Lipscomb, W. M. South Carolina S. G., said: There have been six new Granges organized since the close of the Grange year, making, with the one reported by your secretary, seven in all, organized since the last session of this Grange and up to date.

Students of politics who are studying the decline and fall of the Labor party may find the story of the career of the National Grange, P. of H., an instructive one, especially as a revival of this once powerful organization is now taking place. The prospect for the future of the organization is brighter than it has been before in many years.—*Orange County Farmer, N. Y.*

A few years ago there was great glee among the middlemen and overbearing corporations. The reason for their joy was peculiar, and to the ordinary mind not provocative of merriment. It was simply this: There was a temporary lull in the activity of the Patrons of Husbandry, and immediately its haughty and greedy foes set up the cry, "Lo! the Grange is on its last legs; it is lying down to die." Just here was where their mistake very naturally occurred, for the Grange was only resting itself up for more vigorous efforts, for now behold! it is on its feet again, and is hitting out from the shoulder with a vigor and vim that is at once a terror and surprise to its adversaries.—*Western Rural, Chicago.*

Every week our official report brings the cheering news of new Granges being organized and old ones reorganized, and the live working Granges increasing in membership; many of them have more than doubled their membership. Last week we reported ten new Granges and this week we report four new Granges and two reorganizations—three in Alabama, two in Oregon, and one in Missouri. Thus the work goes steadily on.—*States Democrat, Tennessee.*

Grange Elections.

ALHAMBRA.—Dr. J. Strentzel, M.; E. B. Smith, O.; Mrs. W. B. Thomas, L. E.; B. Barber, S.; James Kelley, A. S.; T. Griffin, C.; H. Rapp, Sr., T.; Mrs. M. B. Lander, Sec.; J. Cornwall, Jr., G. K.; Mrs. C. Wittenmeyer, Ceres; Miss Sarah Young, P.; Miss M. C. Holenbeck, F.; Mrs. E. J. Boss, L. A. S.

BENNETT VALLEY, Sonoma county.—J. B. Whitaker, M.; J. P. Whitaker, O.; J. M. Talbot, L.; Scott Whitaker, S.; Ed. Peterson, A. S.; Sister A. Laque, C.; N. Carr, T.; W. P. Crane, Sec.; Arthur Crane, G. K.; Rhoda Whitaker, Ceres; Vera Talbot, P.; Nellie Peterson, F.; Sarah Laque, L. A. S.; Sister H. Carr, Trustee.

GRASS VALLEY.—Dec. 3: Jona. Butler, M.; Thos. N. Paine, O.; Jno. T. Rodda, L.; Wm. H. Stephens, S.; A. G. Peterson, A. S.; Mrs. E. Bree, C.; Albert Matteson, T.; Clara Kleine, Sec.; Wm. Bree, G. K.; Mary J. Hastings, P.; Margaret E. Hastings, F.; Mrs. S. L. Richards, Ceres; Mrs. Mary Peterson, L. A. S.

WASHINGTON, San Joaquin county.—James Ritchie, M.; Jeff. Siles, O.; R. S. Pardoe, L.; Chas. Child, S.; O. H. Little, A. S.; Mrs. A. E. Blyther, C.; Chas. Blyther, T.; Samuel C. Waters, Sec.; S. W. Sollors, G. K.; Mrs. R. S. Pardoe, P.; Mrs. Leah Bamert, F.; Mrs. Giles, Ceres; Sister Silvia Worthup, L. A. S.; Mrs. Jeff. Giles, Org.

YUBA CITY, Sutter county.—W. J. Hardy, M.; Geo. Ohleyer, Jr., O.; Sister Pauline Newkom, L.; Louis Woodworth, S.; W. E. Sammis, A. S.; Sister A. P. Woodworth, C.; Fred. Cooper, T.; Sister E. M. Wilkie, Sec.; C. E. Williams, G. K.; Sister Sadie Walton, P.; Sister Ella Walton, F.; Sister Della Walton, Ceres; Bro. W. D. Woodworth, Org.

DANVILLE.—R. O. Baldwin, M.; C. E. Howard, O.; F. B. More, L.; J. C. Jones, S.; C. J. Wood, A. S.; Rev. Mr. Burgess, C.; J. M. Stone, T.; J. H. White, Sec.; W. Z. Stone, T. K.; Clara Stone, Ceres; Dora Flournoy, P.; Mira More, F.; Ida S. Hall, L. A. S.

EDEN.—W. C. Blackwood, M.; John McDermed, G.; Fred. Russell, L.; Herbert Cowing, S.; Frank Dassell, A. S.; Bertha Gading, C.; Annie Mohr, T.; Josie Sharai, Sec.; John Suenderman, G. K.; Martha Cowing, P.; Nettie Anway, F.; Annie Obermuller, Ceres; Amelia Gading, L. A. S.

NORTH BUTTE.—L. D. Hedger, M.; W. T. Lamb, O.; L. A. Clark, L.; H. Luther, S.; Tom Bruce, A. S.; Sister Graves, T.; H. S. Graves, P.; James Myres, Sec.; B. R. Spillman, G. K.; May Clyma, P.; May Simpson, F.; Laura Luther, Ceres; Jennie Hedger, L. A. S.; Lizzie Clyma, Org.; W. T. Lamb, Trustee.

TULARE.—A. P. Merritt, M.; J. M. Mears, O.; J. W. Mackie, L.; Joseph Mer-

ritt, S.; M. Kreme, A. S.; O. O. Herilson, Sec.; Wm. Carpenter, G. K.; Sister Merritt, P.; Sister Kreme, F.; Sister Herilson, Ceres; Sister A. P. Merritt, L. A. S.

POINT OF TIMBER.—H. C. McCabe, M.; M. B. Prory, O.; Sister L. J. Wills, L.; W. T. Grover, S.; E. L. Emerson, A. S.; Sister L. G. Prory, C.; C. J. Preston, T.; M. B. Skaggs, Sec.; Jno. Walton Jr., G. K.; Sister S. A. McCabe, Ceres; Sister Maggie Cople, P.; Sister S. E. Smith, F.; Sister Fannie Walton, L. A. S.

WHEATLAND.—D. A. Ostrom, M.; Julius Hollister, O.; Mrs. L. Keyes, L.; Sheridan Harding, S.; Sherman Harding, A. S.; Sister Hollingshead, C.; Sister Lou Fraser, T.; J. W. Huffaker, Sec.; Hugh Morrison, G. K.; Sister L. W. Hamilton, P.; Sister L. G. Jasper, Ceres; Sister C. K. Dam, F.; Rosa Ostrom, L. A. S.; Fannie C. Dam, Org.

NOTE.—The Secretaries of Granges are requested to forward reports of all election and other matters of interest relating to their Grange and the Order.

Date of Installations.

Alhambra Grange—Jan. 7.
North Butte Grange—Jan. 14.
Yuba City Grange—Jan. 7.
Wheatland Grange—Dec. 31.

WORTHY MASTER OVERHISER, after attending National Grange and seeing Bro. Huffman off for Chicago with the California exhibit, went on with Sister Overhiser, by easy stages, alternating with wayside visits, to Brooklyn, N. Y., where they were enjoying themselves among friends at last accounts.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

A WELL-MANAGED NURSERY.—*Irvington Reporter*: Upon P. McKeany's plat of five acres every inch is made available for the production of the various lines of nursery stock, including evergreens of all kinds, different varieties of roses, deciduous fruits, oranges, lemons, limes, pepper trees, acacias, pot plants and exotics. This stock is free from insect pests, is of vigorous growth and full of vitality, and only needs care and proper attention to grow into fruitful and long-lived trees.

Butte.

HOREHOUND HONEY AND BERGAMOT.—*Jas. Dawson in Record-Union, Dec. 9*: W. M. Hoge is establishing an apiary 15 miles from Oroville, and has 20 acres of horehound under cultivation. Last spring he brought 200 swarms of bees through here, and I understand from his superintendent that these increased during the summer to 275 swarms. This horehound plant is the most wonderful honey-producer I ever saw, and the bees cluster in great numbers upon it. I understand that Mr. Hoge (who is from Brooklyn, N. Y.) calculates to average next year 250 pounds of this horehound honey to the swarm, and that he has had overtures made him by a large New York druggist for his entire production for the next 25 years at 50 cents per pound, but his crop has yielded him up to this time fully \$1 per pound. He declined the offer. This same man is successfully growing bergamot, and making oil of bergamot right here in this county.

Contra Costa.

BRADSHAW EGG.—*Item*: We have been shown an egg from the Alhambra Poultry-Yard of Mr. J. J. Jones 6½ inches in circumference, and lengthwise 8½ inches, weight ½ of a pound. The egg was laid by a light Brahma, and is the largest hen's egg we have ever seen. Mr. Jones proves that it pays to keep the best grades.

Fresno.

SWEET POTATOES.—*Fresno Examiner*: A sweet potato weighing 33 pounds is on exhibition at the real estate office of Cole, Chittenden & Cole. It was grown on some land owned by D. W. Lewis in Washington Colony. Mr. Lewis says: "While this is quite a large potato, I have some others I think larger, which I will send in this week to show what really can be raised in the colony." The potatoes he has reference to he thinks will weigh 40 pounds.

Los Angeles.

CEMENTING THE ZANZAS.—*Orange Tribune*: The Santa Ana Valley Irrigation Co., under the direction of Supt. Young, assisted by Zanjero Barbark, have, during the past 30 days, cemented nearly a mile of the main canal known as the "Kirby Fill," besides several hundred feet each side of the tunnel, and it is estimated that at least one head of water will be saved from the seepage that was constantly going on in the exposed places. The work has been done in a creditable manner, and will last for all time; about 600 barrels of the best Portland cement being used in the work just completed. Should the plan of cementing each year a mile or more of the main ditches, as inaugurated by the present Board of Directors, be continued by future boards, but a few years will elapse before all our main canals and ditches will be cemented, and several heads of water that are now lost by seepage permanently saved to the stockholders for irrigating purposes.

BACK TO JAPAN.—*Anaheim Gazette*: Timothy Carroll is in receipt of an order for a large con-

shipment of Japanese persimmon trees to be shipped to Japan, which are to be forwarded immediately. The fame of his nurseries, so well established throughout Southern California, is thus seen to have extended to the other side of the earth.

Merced.

COMPLETING A RESERVOIR.—Merced *Argus*, Dec. 8: We took a ride out to the great reservoir of the M. C. & I. Co. yesterday, and found the work rapidly approaching completion. Mr. Huffman informed us that the force consisted of 250 men, most of whom were managing a pair of mules and scraper, removing the dirt to the top of the embankment and excavating and finishing up the extension of the canal in the direction of Mr. Hooper's Yosemite colony tract a couple of miles to the southeast. The reservoir is practically completed and ready to receive the water. The work now being done is filling and smoothing uneven places upon the crown, placing the roadway in good condition, clearing away debris and giving a finished appearance to the work. The length of the embankment is computed at 1000 yards, width of base in center 275 feet, 54 feet high and 22 feet wide at the crown, forming a smooth, broad road, with wagon bridges across the canal at the inlet and outlet. Thus it will be seen that a supply of water will be insured the coming season for all farms north of Bear creek ready to use it for irrigation.

Napa.

ORANGES.—St. Helena *Star*, Dec. 2: Mr. Beach says that his orange and lemon trees, about 25 in number, ranging in age from 4 to 13 years, have all stood the late cold snap without any noticeable injury. His 158 Japanese Oonshiu orange trees are getting along nicely, and his 6000 seedling orange trees in the nursery have not suffered at all. He can also show 2000 or 3000 oranges, nearly full-size, and just beginning to take on their golden hue. Even his five-year-old trees are in bearing, and with fruit in full size. The same may also be said of the trees of W. W. Lyman, R. W. Lemme, H. J. Lewelling, E. Schuneman, E. Foutz and half a dozen others.

Nevada.

NUTS IN VARIETY.—North San Juan *Times*: P. H. Butler has three pecan trees in his orchard at his residence in this place, which are full of the nuts, now ripe. Mr. Butler has proven to the world that English and American walnuts, butternuts, chestnuts of every variety, almonds and pecan nuts can be raised in this township.

Sacramento.

A CITRUS FAIR IN MINIATURE.—*Record-Union*, Dec. 9: At the Golden Eagle hotel, W. O. Bowers has commenced getting up a little citrus fair of his own, and been quite successful. Silva & Sons of Newcastle have contributed a fine lot of Navel and Seedling oranges, many of them in clusters, surrounded by the foliage, which makes a splendid showing. The samples are large, many of them being over three inches in diameter, and golden in color. The same firm contributes a fine lot of Sicily lemons. N. K. Spect of Orland contributes a number of Navel and Seedling oranges. Placer county also sends a fine lot of olives. Mr. Aurbach of this city contributes a branch of a lemon tree upon which are three crops—ripe fruit, fruit half-grown and fruit that has just shed the flower.

JAPANESE PERSIMMONS.—*Record-Union*, Dec. 3: Many of the gardens of Sacramento are at present decorated with Japanese persimmon trees loaded down with ripening fruit. The leaves of these trees are now all off, leaving the branches and fruit alone, and presenting a very pretty sight. The Japanese who recently visited Sacramento spoke very lauditorily of this fruit, classing it as the finest in that empire, and stated that it would come to be greatly appreciated by the American people when better known. The trees produce very young, and some large specimens of the fruit are to be seen in various parts of the city. In Henry Furry's yard on 14th street, between P and Q, is a small tree, only two years old, that bore 30 fine persimmons this year, and is much admired for its precocity. Other similar instances of early fruiting have been seen in this city.

San Benito.

IRRIGATING DITCH.—Hollister *Free Lance*, Dec. 2: A. S. Sally is busily engaged in taking out a ditch from the river at his ranch. The place where the ditch is taken out is particularly favorable to the scheme, the sides of the river canyon narrowing down so that little difficulty will be experienced in building a dam for a reservoir. The ditch is six feet wide at the bottom. It will run along the eastern slope of the valley and be about 10 miles long. It will irrigate thousands of acres, and those ranches which are under it when completed will laugh at the idea of a dry season.

San Joaquin.

COTTON.—Stockton *Independent*: A farmer who lives near Peters yesterday exhibited in this city a lot of cotton which was raised on his place without cultivation or irrigation. The bolls were large and full, and the fiber was fine and of excellent quality. The farmer says cotton can be successfully raised on any of the land in his section, and to demonstrate it will plant a large field next season.

Santa Cruz.

SQUIRREL-SLUGHTER.—Watsonville *Transcript*: H. C. Peckham, who has the Luning ranch under lease, has been doing some effectual

work in exterminating the thousands of squirrels that formerly made their home on that tract. He used about 500 pounds of a preparation made by himself, and since its use there can hardly be found a squirrel where there were before thousands. Fully 90 per cent have succumbed to the effect of the poison used. The preparation is eaten up within 12 hours after being put out, and not a particle of the preparation is to be found after that time. And what is better still, Mr. Peckham claims that the cost of this preparation is only about one-half of any other kind he has ever used.

FAIR ASSOCIATION INCORPORATED.—*Courier-Item*: Articles of incorporation have been filed for the Pajaro Valley Agricultural and Horticultural Fair Association, for an existence of 50 years. Its business is in the hands of 16 directors, as follows: A. N. Judd, N. A. Uren, G. W. Sill, James Waters, Mrs. A. W. Bixby, Mrs. G. B. Card, Mrs. B. A. Osborne, Mrs. A. P. Roache, Mrs. Ada L. Libby, H. S. Stipp, Mrs. C. W. Stipp, Mrs. M. E. Tuttle, Mrs. L. V. Willets, and Mrs. Henry Jackson.

Sonoma.

DRIER BURNED.—Santa Rosa *Democrat*, Dec. 10: The fruit-drier of Rev. J. Phillips of Bloomfield was burned Wednesday afternoon, with all the fruit that he has dried this season, his carpenter-tools and other property—a very heavy loss to him. The fire caught from the furnace.

Sutter.

QUARANTINE GUARDIAN.—Marysville *Appeal*, Dec. 9: The increase and distribution of insects is one of the drawbacks to the culture of fruit trees. As orchards increase there is reason to fear that the pests will become more numerous and more widely disseminated through the neglect of proper precautions and remedial treatment. H. P. Stabler has been appointed Quarantine Guardian for Sutter county, and can furnish all necessary information for the guidance of fruit-growers who may desire to be advised in this regard.

Tulare.

HARROWING.—Visalia *Times*: J. J. Cairns has a number of Randall harrows tearing up the ground on Deer creek. The land having been plowed late last spring, it turos up in fine condition now with a Randall harrow. Mr. Cairns seeded 15,000 acres in this county to wheat and barley last season, and will engage in the business extensively this season, should the rain come at proper periods.

BALDWIN APPLES.—Delta, Dec. 8: W. G. Daunt has grown Baldwin apples on his place, near the Soda springs, on North Tule river, which are not excelled on this coast. It is his intention to forward a box of them to Los Angeles for exhibition.

ANOTHER RABBIT-DRIVE.—Tulare *Register*, Dec. 9: The rabbit-drive at Pixley, Saturday, was another success. They didn't kill quite so many rabbits as on the first occasion, only a few more than 1000 being slain, but there was just as much fun. The lame, the halt, and the half-blind, the young, the fleet, and the strong, the aged, the feeble, and the decrepit—all were there. Solemn-visaged doctors and bald-headed lawyers, toothless cronies and nimble-footed children, shouting men and women of every age and size, were all mixed up in that seething carnival of destruction. About 500 persons took part, among whom were a number from Tulare. One of the latter, a staid, quiet, elderly gentleman, told us that he wouldn't take \$10 for the fun he had. If all who participated had as good a time, that would make \$5000 worth of fun. As before, a good many rabbits were taken alive and shipped to S. F. to defray the expenses of the drive.

Ventura.

THRASHING RECORD.—Ventura *Democrat*: Ed. Ayers' thrashing outfit made a run of 138 days, commencing on the 6th day of July on barley, and finishing on the 22d day of November on Lima beans. Mr. Ayers thrashed in that time 75,520 cents of barley and 49,416 sacks of beans. He has probably made the best season's work of any of the nine steam thrashers running in the county this season.

Yolo.

ORANGE-PLANTING.—Woodland *Mail*: Dr. J. Clark, whose venture in orange-growing near Arbuckle has been noted in these columns, informs us that the rabbits swooped down on his nursery some weeks ago and destroyed about 6000 young seedling trees, ranging from 6 to 18 inches in height. The doctor, while lamenting his loss, is not discouraged, and will renew his nursery at once. His plan is to obtain rotten oranges in S. F. at the wharves, where the vessels from the orange countries unload. He pays \$5 per barrel for them, and this amount he estimates will yield him from 5000 to 7000 seeds. Dr. Clark will encircle his orange nursery and orchard with a rabbit-proof fence next year.

OLIVES.—R. B. Blowers has on display at Coward & Porter's a branch of a five-year-old olive tree which is loaded with olive berries. Mr. Blowers says that the tree from which this branch is taken has upon it a crop of from 45 to 50 pounds of olives. It is remarkable that a five-year-old tree should bear so abundantly. An acre of such would yield probably \$1000 worth of oil. Olive culture is the surest road to wealth known to the horticulturist.

Yuba.

MARYSVILLE ITEMS.—*Appeal*, Dec. 9: A very attractive display of oranges, lemons, persimmons, citrons, figs and chestnuts, grown in

Yuba and Sutter county yards, is made in the large show-window of J. H. Marcuse & Co.'s store. A large limb of lemons from W. G. Murphy's yard is suspended from the top center. In the bottom, pyramids of oranges and lemons are made. The size and ripeness of the oranges and lemons elicit most comment.... Local dealers say that the crop of mountain apples, especially of the favorite varieties, is very scarce this year.... Pruners commenced yesterday to trim the trees in S. J. Stabler's orchard. When they are done with the 7000 peach trees, H. J. Stabler will commence spraying the trees with a scale-bug preventive.... A visit to the blacksmith shops yesterday showed that they are all running full-handed, turning out plows and harrows and repairing old ones. The season is expected to be one of unusual activity among the farmers and fruit-growers.

THE VINEYARD.

Meeting of the Viticultural Commission.

The Board of State Viticultural Commissioners held its semi-annual session at 230 Montgomery street, Dec. 12th. President Arpad Haraszthy presided, and there were present also Commissioner L. J. Rose of Los Angeles district, Isaac de Turk of Sonoma district, Charles Krug of the Napa district, and George West of the San Joaquin district. Those absent were Commissioners C. A. Wetmore of the San Francisco district, J. de Barth Shorb of San Gabriel, R. B. Blowers of the Sacramento district, and G. G. Blanchard of the El Dorado district.

Commissioner Krug read a short report relative to the mercurial remedy for phylloxera, which is advocated by Dr. Bower. The speaker said that he, Mr. Crabb and Viticultural Officer Wheeler had visited the vineyard of Mr. Hagar at Napa, and they found the alleged remedy a complete failure, though the *Riparia*, a native stock to resist the insect, was found to be working well.

A lengthy discussion on viticultural legislation resulted in the adoption of the following resolutions and terminated the business:

Resolved, That it is the sense of this board that no wine-maker should use any spirits in fortifying sweet wines except grape spirits free of tax.

Resolved, That the bonding period of brandy should be extended to five years, and that distillers should be permitted to break up packages in bond in any size required by the trade.

Resolved, That imported fruit juices compounded with alcohol should be classed as alcoholic compounds and taxed as such. A special effort to secure a revision of the tariff in this respect should be made without delay.

Resolved, That this commission indorses the Green Wine bill introduced at the last session of Congress, and that if any bill is introduced to protect pure wines this session it should be a similar one.

The Downy Mildew.

Dr. H. W. Harkness, president of the Academy of Sciences, writes to the *Evening Bulletin* of Dec. 12th as follows:

Your paper of recent date contains a letter from Professor F. L. Scribner, Mycologist of the United States Agricultural Department at Washington, in which he denies that either "black rot" (*Phylospora Bidwellii*) or the "downy mildew" (*Peronospora viticola*) occurs in California, and warns against introduction from without. With respect to the former of these, I have nothing to add, no specimen from this coast ever having reached me. In regard to the latter there is, unfortunately for us, no doubt that Mr. Scribner is wrong.

The fact that our wild grapevines, in close proximity to vineyards, have been found infested with this most dangerous fungus has been often alluded to by me, and warning given as to the danger of infection.

The importance of the matter to the welfare of the vineyards of the State seemed so pressing that a paper on the subject, illustrated by stereopticon slides, was read by the writer before the California Academy of Sciences June 7th of this year.

It is to be regretted that Prof. Scribner did not make more careful inquiry before issuing his statement, proof to the contrary being directly available, as may be seen from the following extract from *Fungi of the Pacific Coast*, No. 5, in Bulletin California Academy of Sciences, No. 7, issued June, 1887:

Peronospora Viticola, B. & C.—On living leaves of *Vitis Californica*, near Bartlett springs, Lake county, June, 1884, and Russian river, June, 1886.

This fungus, forming large white patches, is confined to the lower surface of the leaf, where only the stomata from which it emerges is found. The corresponding part of the upper surface is much paler than the healthy portion of the leaf, on which account it is noticeable to a considerable distance. In both the cases noted above it is very abundant, and is a menace to our vineyards, not to be lightly regarded.

It was first observed by the writer in 1872 in a vineyard near Sacramento, which has since, the vines having been uprooted, been devoted to other uses. The vineyard was near the levee and in close proximity to wild grapevines, from which the fungus was undoubtedly derived.

Peronospora viticola is not likely to prove injurious in the Northern States, but in California the climate and conditions are similar to those of France and Italy, in which countries it does great damage. It appears with us on the wild vine at the time of flowering and robs it of the leaves necessary to shield

the growing grapes from the scorching rays of sun.

Sulphuring washes and all such remedies, used with more or less success in various fungoid diseases of the vine, are necessarily useless in this, for the resting spore, by which it propagates in the succeeding year, is formed deep in the substance of the leaf and only becomes free by its decay.

Vineyards in the vicinity of infested wild vines will sooner or later acquire it from them, and the experience of the coffee plantations of Ceylon will be repeated. These became infected by a fungus, probably infrequent on the original host, which propagated itself to such an extent on the more fertile one as almost to ruin the planters.

The only effectual remedy which can be suggested is to destroy by fire the infested vines, taking especial care that no leaves escape; and where a vineyard is to be planted in the vicinity of wild vines, it would be well to destroy the latter as a measure of precaution.

The letter of Mr. Scribner will do great harm if it leads our viticulturists to disregard an imminent danger already in our midst, while trying to protect themselves from importation without.

H. W. HARKNESS, M. D.

San Francisco, Dec. 8, 1887.

[Prof. Scribner's visit to this State was very hurried, and he had not time to look the ground over fully. His mission was to determine if possible the disease which was causing such havoc in Los Angeles county, and it was especially with reference to that that he proclaimed the absence of the "downy mildew." Dr. Harkness is right in calling attention to the fact that the disease exists here but has not spread to any extent to cultivated vines. It is of course a standing menace, and precaution against its dissemination should be taken.—EDS. PRESS.]

Caution to Nurserymen and Tree-Buyers.

A Circular by the State Inspector of Fruit Pests.

In view of the continued spread of certain dangerous scale insects, especially of the "fluted" or "cottony cushion" scale (*Icerya purchasi*) throughout the State, due partly to the fact that in their early and minute stage they are apt to be overlooked, and thus are carried hundreds of miles to new sections, we hereby caution all nurserymen, dealers and purchasers of nursery stock to exercise the utmost caution in selecting their stock, especially of citrus trees, and certain ornamental evergreen trees as well, especially acacias. Before ordering they ought to inquire carefully into the condition of localities from which they buy, to satisfy themselves that no danger of contagion exists. In regard to the location known to be infested, we refer them to our report to the State Board of Horticulture, and to that of Professor Riley to the Department of Agriculture of United States, and we shall always cheerfully give any information necessary on this point; but due allowance must be made for the utter impossibility of visiting all portions of this vast State, and the fact that in but comparatively few counties we receive any co-operation from local authorities.

To those unacquainted with the appearance and habits of the *Icerya* we also refer to the report of the State Board of Horticulture and to that of Prof. Riley, where full illustrations and descriptions of this veritable pest of our trees and plants can be found. As matters stand now we claim it is the bounden duty of any one interested in the welfare of our gardens and orchards to become familiar with this pest, and assist in its extermination, otherwise it will only be a question of time when the whole State shall become infested. We shall discourage all buying from any locality known to be infested, and in case of shipment from such places we demand the most thorough disinfection, which shall consist in the dipping for at least one-quarter of a minute of all parts of the tree in a certain solution, viz.:

One pound of lye (American concentrated) or four-fifths pound of caustic potash (98 per cent) to a soap solution of 25 gallons, made of one pound of the best whale-oil soap (containing no more than 25 per cent of water) to four gallons of water. Solution to be used warm, 110° F.

Importations from Other States and Foreign Countries.

As it is a fact that we have received our worst insect enemies from other countries, the same caution must be taken in regard to the introduction of new pests from any of them, and importers of orange trees from Japan and Florida are asked to keep me notified as regards the time of receipts of consignments, and to co-operate with any local authorities that may exist.

As regards the possible importation of the curculio or plum weevil on deciduous trees, we urge the necessity of shipping only trees which are free from soil adhering to the roots.

In regard to the enforcement of these rules we shall rely upon the local quarantine guardians as well as on all honorable dealers to whom we appeal for the closest co-operation in this matter, which is of the utmost importance to the prosperity of the fruit industry and horticulture in general.

W. G. KLEE,

State Inspector of Fruit Pests.

Berkeley, Dec. 13, 1887.

Music's Power.

[Written for the RURAL PRESS by EDITH DEXTER.]

Naught on earth hath music's power,
Sweet music's in the soul's dark hour;
Its magic influence, its holy spell,
The depth of language fails to tell.

It cheers the heart when tired of strife,
And soothes the closing hours of life,
And often by its sweetest strain
To saddened lips brings smiles again.

A mighty King by griefs oppressed,
On his loved harp found comfort blest,
And warriors brave and conquerors proud
To music's unseen power bowed.

The Hebrews of the olden days
Expressed their joys in songs of praise;
E'en mythic Pan, by river's brink,
Made the bright sun forget to sink.

Greek Orpheus, in the classics famed,
Melted the rocks and wild beasts tamed;
Yet sweeter, holier power it knows
When the sad heart forgets its woes.

But when in solemn prayer sublime
It gently tells of Love Divine—
God's love—and soft the Vesper calls,
On our hearts the *Spirit of music* falls.

Eva's Lesson.

There were indications of a domestic storm brewing as Richard Hayes entered his house at seven o'clock one fine evening in June; his little three-year-old May ran eagerly to meet him, and baby Harry stretched out his dimpled hands and prattled a glad welcome, but his wife's face showed that no pleasant greeting awaited him from her.

"So you have condescended to put in an appearance at last!" she said angrily. "I conclude you intended to stay all night watching that silly baseball game and guzzling beer."

Richard's face flushed painfully at the last taunt, so wholly undeserved. Although harsh words were becoming of almost daily occurrence in his once happy home, he felt them most keenly now, as they were uttered in the presence of an intimate friend, who had never before seen these too frequent outbursts of anger.

"Well, come to supper," Eva said ungraciously; "you have kept us waiting an hour, and I've no doubt Clarice is half starved."

Clarice protested pleasantly, and Richard made courteous excuses for his delay, but Eva was too angry and impatient to heed them. Her sharp words and unkind reproaches marred all the pleasures there might have been at her next-day spread supper-table.

At the earliest moment Richard escaped from the unpleasant home atmosphere and took his little ones out for a walk.

To Clarice the whole scene had been painful. Slight indications of growing unhappiness between her friend and her husband had been betrayed before, but nothing like this. And it had been such a pleasant home. She remembered how proud Eva had been of her handsome, even-tempered husband, how devotedly she had seemed to love him in those early days. She recalled the tender confidences Eva had poured into her ears of his patience, his constant kindness and generous devotion; but now, in her impatience and ill-temper, everything was wrong—petty faults and foibles, that would have passed unnoticed in the old days, were dwelt upon harshly and magnified into serious defects.

A merry, thoughtless girl, fond of society and gay pleasures, Eva had taken upon herself the duties of wife and mother without a thought of how weary the burden might prove to be.

For two or three years she bore them remarkably well; she was very proud of her handsome husband, her pleasant home and her bright, sprightly little girl, whom every one admired and petted. But with the coming of the second child her cares increased, the household duties became heavier, and her confinement to home closer. She never realized how largely the nervous irritation, which made her so cross and fault-finding, was caused by these things.

Confined to her close, warm rooms day after day, with rarely any other society than her little ones, who shared her irritability, the troubles had increased rapidly.

From an occasional impatient word, it had grown to sharp, angry reproaches and constant fault-finding, until Richard was beginning to seek pleasure in the society of friends outside, only to be met with still harsher words each time on his return. Thoughtless and ignorant of the laws of health, it never occurred to either that a ride or walk each day, a few hours in the open air, would do more to cure all this trouble than would either sermons or good resolutions.

The day of Clarice's visit everything had gone wrong. It had been very warm, and Eva

had spent many hours in her close, hot kitchen, over the ironing and baking, while May, mischievous little puss, had been unusually troublesome, scarcely out of one piece of mischief before she was into another, keeping the baby in constant fretfulness by her teasing until Eva's patience was exhausted, without the additional vexation of having her husband take advantage of a half-holiday to attend a baseball game and delay his return beyond the usual hour.

"Oh, if girls only knew when they were well off, they would never marry," she said bitterly, as she seated herself at the parlor window with her friend. "Just look at the cozy life I led before marriage; and now it is work, work, from morning till night, no chance for rest or recreation, no opportunity to go out, and the children drive me nearly wild, while my husband cares no more than a block for all my troubles. Oh, I wish I were free once more! I would—" she broke off abruptly, and leaned out of the window. "For heaven's sake," she cried, excitedly, "just look at that child! May, come out of the room this instant, or you'll get a good whipping. Dick Hayes, are you crazy? There's that child in the middle of the road, liable to be run over any moment. A smart man you are to take care of the children!"

May was in the street, running here and there, kicking at some bits of stone and now and then stopping to dance, whirling and twisting, jumping like a ballet-dancer, while her father, on the walk near her, was pushing the baby-carriage containing little Harry, walking slowly, his eyes bent on the pavement, evidently unmindful of what was passing around him. At the sound of his wife's sharp voice he lifted his head, and for the first time saw May's danger.

"Come here, May, this instant!" he called quickly. But May stopped for a moment only in her dancing, then whirling on her foot cast a saucy, defiant glance at her father.

"May, do you hear me?" he said sternly. "Come over here!" And dropping the handles of the baby-carriage he started rapidly toward her. May stood still for an instant, kicking the earth with her tiny shoes, then started to obey.

At that moment there was a rattle of wheels, the quick tramp of a horse's feet, and before the child had passed half the distance to the walk a horse attached to an empty, broken carriage came rapidly round the corner not a dozen rods from her. The whiffletree of the broken carriage dashed against the horse's heels at every jump, and half maddened with fright, he was tearing down the street at a furious pace. To spring into the road and catch May in his arms was the work of an instant; but the horse was close upon them, and with a shout Richard threw up his arms almost in its face, thinking it would naturally turn to the right, but, on the contrary, the animal in its mad terror swerved to the left and struck Richard with full force. In an instant the iron hoofs and heavy vehicle had passed over his prostrate body, and at the next bound the wheels struck the baby carriage, leaving it wrecked about the helpless little form. It was all over in a moment, the frightened horse was dashing madly down the street, and the three bodies lay apparently lifeless in the road.

So suddenly had it all happened that Clarice and Eva had stood as if paralyzed with horror, then with a quick cry Eva was out of the house and down the steps. Reaching the wrecked baby-carriage she lifted her child from amid the debris. There was a cruel gash at the back of the head, from which the blood was flowing freely, while the fair hair, the sweet face, and dainty white garments were stained with the crimson tide.

The beautiful blue eyes met hers in a dull, glassy stare, there was a quiver of the blue-veined lids, a quick gasp, and a little form lay limp and lifeless in her arms.

A crowd had rapidly collected and Richard and May were carefully lifted and borne into the house, while Eva, like one bereft of her senses, silently and mechanically followed, holding the lifeless form of her babe pressed closely to her breast.

In the middle of the pleasant parlor she paused and looked with a wild, horror-stricken countenance from the pallid, blood-stained face upon her breast to the unconscious forms of her husband and child upon the sofa. Clarice came toward her, passed her arm about her and tried to lead her to a seat. Slowly Eva turned toward her; then as she seemed to recognize the friendly sympathetic face, she cried out in tones of heart-rending agony: "Oh, Clarice, Clarice! I have murdered them! I wished myself free, and God has taken me at my word!"

She staggered, threw out her hand blindly, and sank in a dead faint in her friend's arms.

Through all that long sad night she passed from one fainting fit to another, tasking all the skill of the medical attendants and the kind care of her friend.

She would revive only long enough to recall the terrible accident; then, with a repetition of her first wild cry—"I have murdered them!"—would relapse into another fainting fit, only to repeat the same over and over, until at last, as the morning began to dawn, worn out with the fearful struggle, she slept the sleep of utter exhaustion.

When she awakened a few hours later her friend's face greeted her opening eyes. At first she gazed around in bewilderment, then, as there came back to her the scene of the previous evening, she turned her face to the wall,

and the first tears she had been able to shed fell freely. Clarice pressed her hand in tender sympathy, making no effort to check her tears, thinking wisely they were nature's best relief for the aching heart and overcharged brain.

After a few moments the tears ceased, and Eva lay motionless with closed eyes, only an occasional sob shaking her light frame.

"Oh, Clarice," she said at last, in broken tones, "I am most bitterly punished. I wanted to be free, and now they are all gone! I am utterly alone! Oh, my God, how can I bear it?"

"But May is not seriously hurt," Clarice hastened to explain; "she was only bruised and stunned. Here she is now," as the mischievous cause of all the trouble, awed and quieted by the strange scenes around her, slipped timidly into the room.

Eva sprang up with a wild cry, and, dropping on her knees, caught the child in her arms. "Oh, thank God!" she uttered fervently, "that I have even one left."

"Your husband is alive," Clarice said softly, laying her hand upon the bowed head. Eva raised her eyes quickly.

"Oh, Clarice, say it again!" she cried, hysterically, between sobs and tears. "Dick alive! I must go to him." And she rose to her feet, trembling in every limb from the reaction of feeling.

Clarice laid her hand gently on Eva's arm as she turned to leave the room.

"Wait one moment, dear. Richard is very seriously hurt—his head is cut badly and one leg is broken. It was a long time before the doctors could restore him to consciousness, but they think now with the best of care he may recover."

Eva had sunk into a chair, her eyes fixed intently on the face of her friend, as if every word were life or death to her.

"If care can save him, then he shall surely live. How good God is to me!" she added fervently, the tears falling again, but this time like soft summer rain.

"And my baby, Clarice, will he live also?" She almost held her breath, awaiting the reply.

Clarice did not answer, only passed her arm around Eva, and drew her head against her shoulder.

"Clarice, tell me," Eva pleaded, "is he dead?"

"Yes, dear," Clarice said gently, her tears falling in sympathy for the bereaved mother; "he was dead before the doctors came; he must have died instantly."

"No, he died in my arms!" Eva said with a sob. "I remember he gave one gasp as I took him up. O my baby, my baby!" and she broke forth again into piteous sobs, and rising, started to leave the room.

"One moment, please," Clarice said, again detaining her; "let me go first. He was asleep a few moments ago, and the doctor left orders that he must not be disturbed."

She left the room, and in a few moments returned and motioned Eva to follow her.

"Be as calm as possible, dear," Clarice whispered as she left her. As the door closed softly behind her friend, Eva stood still a moment at her husband's bedside. His head was well covered with bandages, concealing the ugly wounds beneath, the eyes were closed and his face wore the pallor of death. Her heart grew faint within her; surely he would die, if not already dead; and every unkind word she had spoken rose up before her like avenging spirits.

How all the old love revived with ten-fold power! He had never, even in their happiest days, seemed so inexpressibly dear as at that moment! Oh, if God would but spare him, a life-time of devotion should atone for all past unkindness.

A quick sob broke from her, notwithstanding her efforts of self-control. Richard's eyes unclosed and with a faint smile he held out his hand to her. Dropping on her knees by the side of the bed, she laid her head beside his on the pillow, while his arm was passed fondly about her.

"Oh, Dick, forgive me!" she sobbed, forgetting all her caution. "I shall never forgive myself; I'll never speak an unkind word again, never, never, while I live!" The sentences were broken and disjointed, uttered amid sobs and tears.

"There, there, dear," Richard said, gently, as he drew her face closer to him and kissed her tenderly. Then, with a noble generosity, which seems a part of some men's natures, he added kindly: "I was to blame; I should have been more thoughtful; I ought to have taken you out instead of going off alone for my own pleasure. We will begin anew now—"

He stopped, unable to finish the sentence.

"Yes, I know! Harry is dead. Oh, my baby! my baby!" she sobbed.

Richard's lips quivered and the heavy eyelids were pressed upon the pallid cheeks to repress the starting tears. He drew her closely toward him and tenderly pressed her tear-stained cheek against his own in mute sympathy, but could utter no word.

How very, very dear his beautiful boy had been to the young father, none but God might know.

For a long time they were very quiet, Eva's sobs alone breaking the stillness, until at last those ceased and Richard said softly:

"Evvie!"

"Yes, dear!"

How many long months had passed since she had heard the dear old pet name from his lips! How many more since she had spoken one endearing word to him! The sound of them now

carried them back to the old, happy days before harsh words had been spoken or unkind feelings held sway.

"What do you wish, dear?" Eva asked, waiting a moment for her husband's request.

"Harry"—his lips trembled—he could not go on.

"Yes, dear," Eva said softly, divining intuitively, in her new-found sympathy with her husband, the wish he could not express.

Rising quietly, she passed out of the room. In a few minutes she returned, bearing the dead babe in her arms.

All the violence of her grief seemed hushed into stillness in the presence of death.

Seating herself on the side of the bed, she turned her precious burden tenderly until the father's eye could rest on its face, his hands touch it without change of position.

Never in the full flush of health and infantile beauty had their boy looked more lovely than now, as, robed for the grave, he lay in his mother's arms. The fatal wound had been deftly concealed, and the looks of hair fell over the white forehead in soft, curling rings; the long lashes of the blue-veined lids lay lightly on the fair, round cheek; the sweet curved lips just parted with a smile, and the pretty dimpled hands were crossed on the lifeless breast.

Too fair and beautiful he seemed for the coffin, the cold, dark grave.

The white lips of the young father quivered, and the large tears forced their way from beneath the trembling eyelids, as he laid his hand on the head of his darling boy. Then his hand fell softly upon Eva's, with a gentle, loving clasp.

"Our darling Harry is safe in a better world," he said at last, in a voice broken by emotion. "And let us, dear, make his death the beginning of a new life of thoughtfulness and forbearance each toward the other."

And Eva, touching her lips with tender reverence to the fair, cold forehead of her darling, said softly:

"God being my helper, I will prove that the death of my precious boy has not been in vain."

Hindoo Maxims.

EDITORS PRESS:—The following maxims have been culled from notes made while reading different books regarding this ancient people, whom we had been taught in our childhood to regard as heathens, whose future abode was one where they would not be likely to suffer from cold feet. Whatever the masses were, it is evident there were some enlightened teachers among them.—M. A. SHELDON.

The original Hindoo religion recognized but one God, also the sages of Greece. The Hindoo Vedas (that had the same authority with them that the Bible has with Catholics and Protestants) was written 3000 years before Christ. Deity is thus defined: "He who exists by himself, who is in all, because all is in him."

"The Ganges flows, it is God; the ocean roars, it is God; the wind blows, it is He; the cloud that thunders, the lightning that flashes, it is He. As from all eternity, all existed in the spirit of Brahma, so to-day all that exists is in his image."

Manou, a Hindoo philosopher, wrote 4000 years ago the following maxims, that are as well worthy of acceptance now as then:

"Of all things pure, purity in the acquisition of riches is best. He who preserves purity in the acquisition of riches is really pure; not he who is purified with earth and water."

"As the body is purified by water, so is the soul by truth."

"Sound doctrine and good works purify the soul."

"The intelligence is purified by knowledge."

"Science is useless to a man without judgment, as a mirror to a blind man."

"The man who only appreciates the means, according as they conduce to his success, soon loses his perception of the just and of sound doctrine."

Christna (a Hindoo) taught this about the soul (that a benighted being like myself, groping for light, can better comprehend than much of the teachings of theologians of the past 50 years).

"The soul is the principle of life, which Sovereign wisdom employed to animate bodies; matter is inert and perishable; the soul is immortal."

The Vedas has also a good word to say for women, that will be a grain of comfort to the female sex even if it neglects to say that all women as well as all men in these United States should have the ballot.

We cherish a private opinion that neither should have it till by a rigid examination they have proved they can exercise the right of suffrage intelligently.

Thus saith the Vedas: "He who despises women despises his mother. There is no crime more odious than to persecute women, and take the advantage of their weakness to despoil them of their patrimony. When women are honored, the divinities are content, but where they are not honored, all undertakings fail."

The Hindoo philosopher, Narada, reputed to have lived before the deluge, reasons thus: "Never resort to the argument, I do not know this, therefore it is false. We must study to know, know to comprehend, and comprehend to judge."

"Thank God for such heathens. May they increase in number and wisdom and be able to send us a cargo of missionaries to convert the heathen in America, in return for the efforts made and lives lost to convert the Hindoo heathen to our accepted beliefs."

Horace Greeley Crossing the Sierras

BY JOAQUIN MILLER.

The old stage-drivers of the brave old days!
The old stage-drivers with their dash and trust!
These old stage-drivers they have gone their ways,
But their deeds live on, though their bones are dust;

And many and many a tale is retold
Of these daring old men in the days of gold:

Of honest old Monk and his Tally-Ho,
When he took good Horace in his stage to climb
The high Sierras with their peaks of snow
And 'cross to Nevada, "and come in on time;"
But the canyon below was so deep—oh! so deep—
And the summit above was so steep—oh! so steep!

The horses were foaming. The summit ahead
Was as steep as the stars on a still, clear night,
And steeper and steeper the narrow route led,
Till up to the peaks of perpetual white;
But the faithful old Monk, with his face to the snow,
Sat silent and stern on his Tally-Ho:

Sat silent and still, sat faithful and true
To the great, good man in his charge that day;
Sat vowing the man and the mail should "go through
On time" though he bursted both trace and stay;
Sat silently vowing, in face of the snow,
He'd come in on time with his Tally-Ho!

But the way was so steep and so slow—oh! so slow!
'Twas silver below, and the bright silver peaks
Were silver above, in their beauty and snow;
Where eagles swooped by, with their bright, shiny
beaks;

When, sudden out-popping a head snowy white—
"Mr. Monk, I must lecture in Nevada to-night!"
With just one thought that the mail must go through;
With just one word to the great, good man—
But weary—so weary—the stage wheels drew
As only the weary old stage wheels can—
When again shot the head; it came shrieking out-
right:

"Mr. Monk, I MUST lecture in Nevada to-night!"
Just then came the summit! And the wide world
below.

It was Hank Monk's world. But he no word
spoke,
He pushed back his hat to a high peak of snow!
He threw out his foot to the great strong brake!
He threw out his silk! He threw out his reins!
And the great wheels reeled as if reeling snow
skins!

The eagles were lost in their crags up above!
The horses flew swift as the swift light of morn!
The mail must go through with its message of love,
The miners were waiting his bright bugle horn.
The man must go through! And Monk made a vow
As he never had failed, why, he wouldn't fail now!

How his stage spun the peak like a fair spider's web!
It was spider and fly in the heavens up there!
And the swift swirling wheels made the blood flow
and ebb;

For 'twas death in the breadth of a wheel or a
hair.

Once more popped the head, and the piping voice
cried:
"Mr. Monk! Mr. Monk!" But no Monk re-
plied!

Then the great stage it swung, as if swung from the
sky:

Then it dipped like a ship in the deep jaws of
death;

Then the good man he gasped, as men gasping
for breath,

When they deem it is coming their season to die.
And again came the head, like a battering ram,
And the face it was red, and the words they were
hot:

"Mr. Monk! Mr. Monk! I don't care a ———
Whether I lecture in Nevada or not!"

Parable of the Spider's Web.

[Written for the RURAL PRESS by ALICE KINGSBURY COOLKY.]

Once upon a time, on a bright, beautiful morning when the air was full of perfume and musical with the songs of birds, a sweet, tender-hearted girl looked with loving eyes upon the scene, and with her heart and eyes she thanked the Creator for making the world so beautiful and her life so happy.

Across her path, from bush to bush, was a hining thread, and clinging to the dewy rose-buds was the perfect home of a little garden spider. She hesitated at breaking such an exquisite piece of work, but the wind, more thoughtless, dashed her robes against the delicate structure, and in a moment the little insect's beautiful home was destroyed.

"Too bad!" she murmured, as she passed on to greet a friend.

"Was it not almost sad that my dress should have destroyed the work of hours, perhaps days, of some poor little harmless spider; it was so perfect, too," said the lovely girl to her friend, and the friend passed on, and in a little while told another friend: "How sentimental was dear Miss ———. She had almost cried because she had broken a spider's home," and that friend told another friend: "Miss ——— got mad and cried and broke some one's house."

And the little bird that carries all bad stories had soon borne it to a whole neighborhood, and it was soon told "That Miss ——— had broken into a person's house and destroyed everything."

And people looked at each other and shook their heads and said, "I told you so."

Friends grew cool, and the lovely maiden wondered, and still the story grew: "Miss ——— had broken into Mr. S.'s house, destroyed the furniture and killed his wife!"

Friends passed the lovely girl with averted heads and frowning faces.

And the girl began to fade and droop as a

beautiful flower. Still the story grew and faster the friends forsook her.

"What is it?" she cried in agony. "The very world seems changed."

And she faded with the flowers, and when the snow fell, her spirit, as pure and white as the falling flakes, passed them on her way to that home where enter not those who maketh a lie, nor scandal-mongers, nor busybodies, only the pure in heart and the merciful. So God gave his beloved peace.

And they buried her under the cold, hard earth, that was not colder or harder than the hearts and tongues that had murdered her. And this all came of a broken spider's web.

YOUNG FOLKS' COLUMN.

Seaweed and the Sand-Piper.

A Fairy Tale.

[Written for the RURAL PRESS by MARTHA F. TYLER.]

A long time ago, when people were simpler and more superstitious than they are now, there lived, in a fisher village somewhere on the coast of Scotland, a little girl called Seaweed. That was not her true name, of course, but she had acquired it because she was long and lanky, with very light brown hair and greenish eyes, and could float on the water like a piece of kelp.

"Not at all a pretty heroine for a fairy tale," you say. No; but it is not always the pretty children upon whom the fairies bestow their choicest gifts. They often favor the poor and plain. To work wonders for a boy or girl who has almost nothing to wish for, would not be to show the real power of the elves and brownies.

The sand-piper was a dark-skinned, bright-eyed boy. He would run along the beach with his little bare, brown feet so swiftly and with so bird-like a motion that the fishermen would cry as he pattered by, "There goes the sand-piper," and that is the way he earned his name.

About a mile from the shore, just opposite the hamlet in which Seaweed and the sand-piper lived, there was a small island, and on the island a cave called the Sea Fairies' grotto, because it was supposed to be inhabited by those little people, who, no doubt, found the cool, dim chambers of the enchanted cavern a more agreeable dwelling-place than the exterior of the rocks, which was exposed all through the day, at least, to the broad glare of the sun, and the wonder-folk, you know, avoid the daylight. Not only did the children believe in these fairies but every fisherman and fishwife in the town would have given you accounts of them, cautioning you in a whisper at the same time to shun the haunted locality. Once an inquisitive fellow had landed on the island and declared his intention of exploring the mysteries of the cave. It was conjectured that he had but reached the entrance when he met with the punishment his rashness invited, for the next day his lifeless body was discovered stretched across the mouth of the dreaded opening. "Tis ill luck meddling with the fairy folk," your informant would have added with a shake of his head as he concluded this harrowing tale.

Now Seaweed and the sand-piper were overbold. The little man was afraid of nothing, and Seaweed, I regret to say, was a genuine tom-boy. The fiercer the wind blew on a stormy day the more delighted were they. They scaled the highest rocks in search of gulls' nests, and a lacerated hand or foot was considered a slight penance to pay for the beautiful, large, green eggs with which their efforts were usually rewarded.

One day the two friends were seated together on the soft, warm, yellow sand. The wind swept gently over them like some great, wide-winged bird, for it loved them, the wind did, these children of the sea and sky.

"Sandy," said Seaweed rather abruptly, "do you fear the small folk?"

"I do not know," answered the sand-piper meditatively. (He did not say it that way, however; he said, "I dinna ken.") "I fear not Giles Hobson, nor his great sword, nor his sharp words, but the small folk are queer folk. A body needs must fear what he cannot see."

"Sandy," said Seaweed mysteriously, as she edged a trifle nearer to him, "I saw a fairy last night. I just opened my eyes, and there she stood in the moonlight—a lovely, wee lady, with something shining in her hair like a star. 'Seaweed,' she said, and her voice was like the singing one hears in the sea-shells, 'do thou and that wild laddie whom thou callest the sand-piper, take a boat to-morrow at midday and row for the fairies' grotto on the island. My people have there a gift for thee and for him. Thou hast indeed a staunch heart for a lass, and he is a brave Scotch laddie.' Then in a twinkling she vanished and there was naught but the moonlight. There, Sandy," Seaweed continued with a wave of her hand, "is my father's boat. It will be idle these two hours coming. Let us do the fairy's bidding."

The sand-piper, in whom the spirit of adventure was strong, needed no second urging, and the two children were soon gliding over the blue waves, arriving in a short time at the island, where, after securely mooring their boat, they prepared to enter the awful cavern, hand in hand.

There was an opening at either end of the

grotto, and sufficient light was admitted to enable them to see quite distinctly when their eyes had become accustomed to the twilight. For some minutes they walked on in silence, for they were almost breathless, partly at thought of their own daring and partly with the expectation of what they hoped to see. There was no sound but the roar of the ocean thundering among the rocks, and not a fairy could be discovered anywhere.

Seaweed began to experience a sense of disappointment, when suddenly she stumbled upon some object lying in the way, which examination proved to be a small iron chest—rusty, as if it had lain in the damp atmosphere for years.

"We'll take it to the light," said the sand-piper; "perhaps there's something in it."

There was gold in it! And there were precious stones in it! "Pretty fairy things," the children cried delightedly, not knowing what else to call them. Fairy things, however, which made them comparatively rich, for no one in the village ventured to dispute their claims to the contents of the box, or doubted that the treasure had been brought to the cave by the small folk for the benefit of the two brave children.

Seaweed all her life long, even after she was a woman grown and had become Mrs. Sand-piper, was referred to as a person who possessed, to a remarkable degree, the gift of what the Scotch call second sight.

Now, if you are skeptical in regard to fairies you may think, if you like, that the treasure was deposited in the cave for safe-keeping by some wild seaman who had probably stolen it, and who, intending to return for it one day, had perhaps been lost in a storm meanwhile, and so never did.

"But," you insist, "this would not account for Seaweed's dream—if it was a dream."

Very true: that is quite inexplicable. There must be fairies after all, then.

GOOD HEALTH.

Diphtheria.

In response to "Constant Reader's" inquiry, an old subscriber sends us an extract from the *Stockton Mail*, of Jan. 15, 1886, remarking that the treatment spoken of was practiced in that city with great success. After speaking of the fact that diphtheria in the malignant form sets at defiance both the "regular" and the homeopathic practitioner, and kills the patient, the article proceeds: "In view of these facts, it is worth while to consider a method of cure once practiced very successfully in this county, and which the practitioner declares without reserve will cure every case of diphtheria that is taken in time, or that is treated before that stage is reached which any of the old-school physicians would pronounce necessarily fatal. His method is simply to put the patient at once into a pack until copious perspiration ensues. The pack is repeated at proper intervals, and no medicine whatever is given, attention being paid merely to diet and regimen. He is willing to stake his reputation that he will cure any case of diphtheria submitted to him before the disease has progressed to the obviously fatal stage.

"Considering that the allopaths and the homeopaths are perfectly helpless in the presence of this comparatively new affliction to children, why would it not be a good idea to give the packing plan a fair trial? The devotees of medical science are the slowest persons in the world to concede the possibility of a valuable new discovery outside of the line of investigation followed by the books; but in a case of this kind, considerations of humanity urge the adoption of any plan, books or no books, that will save the little ones."

[We do not care to continue farther the discussion of the diphtheria treatment in the form which it has taken. We aimed to satisfy a correspondent, but we cannot undertake to discuss at length the mooted "treatment."—EDS. PRESS.]

SKIN DISEASES.—The laity believe, as a rule, that cutaneous diseases result from "bad blood," the impurities of which find exit through the skin, and in so doing take the form of an eruption. Consequently it is harmful to remove them. I have had, says a specialist, patients express themselves as very solicitous about the sudden cure of a disease of the skin; the consequence, in their opinion, might be disastrous by the "driving of a disease that might attack an internal organ." Nothing could be more absurd, for it is absolutely impossible in this sense to either "drive in" or "drive out" a skin disease. The blood has little to do with skin disease. There are diseases as peculiar to this organ as to any other, entirely localized, depending upon changes in the tissues themselves. Others are caused by parasites; still others by nervous disturbances. It is evident that the much-lauded "blood purifiers" for cutaneous diseases are, to say the least, useless.

HEART DISEASE AND INDIGESTION.—There isn't a doubt of the truth of the statement of a New York physician that half the cases of so-called heart disease are only indigestion, and more men are scared to death than die any

other way. Dyspepsia causes a pain in the breast and makes the heart beat rapidly. The physician advises sufferers to give up tea, coffee, tobacco, beer and whisky—if they are users of these things—eat brown bread and plenty of good meat, especially rare roast beef, and let hot bread, cake, pudding, and pastry severely alone. A powder of bismuth and bicarbonate of soda before each meal, for a month, is recommended. That self treatment, with abundance of exercise, will effect a cure in 19 cases out of 20.

BLINDNESS INCREASING.—It is stated on good authority that blindness in the United States is increasing. While the population during the ten years from 1870 to 1880 increased at the rate of 30 per cent, blindness increased over 140 per cent.

DOMESTIC ECONOMY.

Curing Pork.

EDITORS PRESS:—I have been much interested in the methods of curing hams and bacon, as recently given in the *RURAL*, and perhaps the more so just now, because of 10 fat hogs being in the pen 50 yards from where I am writing waiting favorable weather to be made into bacon, and that matter of *weather* has not received due attention. Kill at such time that the night after killings shall be frosty. A warm, foggy night will not remove the animal heat from the slaughtered hogs, but, on the contrary, will do much toward souring and spoiling the meat.

Another matter is the *kind* of salt to use. There are brands of salt that are almost certain to spoil meat if used in curing it. This I have learned by more than a quarter of a century of experience of curing a family supply of meat in our warm climate and by testing different brands of salt that have caused me the loss of an aggregate of several tons of meat, and while I do not wish to publish any brand of salt as uniformly bad, I do wish to say that the only brand that I have found to be uniformly *good* is the "Worthington Liverpool salt." If any *RURAL* readers have found other brands of salt equal to this in meat-preserving qualities, I wish they would make it known. There are many brands of salt put up right here in our own country. I have tried a portion of them, and always with loss, but if there is a brand as reliable as the "Worthington" I desire to know it, though I have done my share of experimenting, unsuccessfully, to find it.

My Method

Briefly stated would be: Get all ready to butcher, then wait for a frosty night. On the day preceding kill, dress, and hang up your hogs over night to expel all of the animal heat. On the morning after they've hung over night, cut them up and rub thoroughly with the following and lay in a cool place: For each hundred pounds of meat use 10 pounds of "Worthington" salt, 2 pounds of brown sugar, and 4 ozs. of finely pulverized saltpeter. Add boiling water enough to about half dissolve this mixture, keep it boiling while you dip your meat into it, a piece at a time; then when partially cooled rub each piece of meat thoroughly with the undissolved salt, etc., from your boiler, allowing as much to adhere to the flesh side of the pieces as will do so, laying it after rubbing in a cool place, skin side down. In like manner rub daily, using the wet salt left from first rubbing for three days; follow with rubbing three times on alternate days, using additional dry salt if necessary. Then cover with brine as strong as it can be made for ten days more, or, if more convenient, continue the salt rubbing every two or three days, keeping all the while in as cool a place as possible.

In 20 days from your first salting your meat should be ready to smoke. You can smoke so as to make fairly good ham in three days by using sulphur—plenty of it—to smoke with, but it is better if you are not in a great hurry to smoke with brush, wet straw, or corn cobs, being careful not to make fire enough to cause heat. Let it remain in the smokehouse—the longer the better—frequent smoking being the only necessary preservative and protection from flies and insects.

Canning Fresh Meat.

Never use rosin or wax in canning meat; the grease from the meat will dissolve either of these, in many cases spoiling or very much injuring the flavor of the meat. Procure cans that can be soldered. Cut the meat from the bones and put it into the cans raw and cold, pack each solid full, adding only such salt and seasoning as will be necessary in cooking. Solder the can covers on, making them air-tight. Puncture each cover in the center with a very fine awl. Set the cans into a boiler of water and boil them from 40 to 50 minutes. As you take them from the boiling water, immediately close the puncture with your soldering iron and a drop of solder; they are ready to set away and keep. You can open them when required for use by using a very hot soldering iron or other large heated iron, running it around where the cover is soldered on—both cover and can being thus kept in good condition for future use, year after year.

The Week.

The week has given us a fair sample of California winter with a dash of north wind at times, a heavy shower at others, warm sunshine between, and grass growing all the time. There have been days fit to intoxicate the new-comer, and to arouse all the State pride of the old-timer—days when one can bask in the sunshine and look out into the clear air so far that were the earth's surface concave one could see the whole of it. There has been rain enough to start work in many places, but more is still desirable. So far the ends of the State and the interior valleys seem to have been better favored than the central coast region, but there is time enough for that.

All seems ready for the spike-driving on the California & Oregon line, and the event will take place on Saturday of this week at Ashland, Oregon. Another important event will be the Citrus Fair at Oroville, which will open December 20th. To both of these places excursion trains will steam out, giving all a chance for an airing before Christmas. Open-air events in December are something of an exponent of California climate.

The various boards of trade are gradually affiliating with the State Board, and the time is not far distant when all the counties will be represented on the executive committee.

Postal Progress.

The signs of the times certainly favor reform and extension in the postal service, which will be of great public value. In the matter of the postal telegraph, which we have constantly advocated for years, both as a relief from oppression by monopolies and to make the telegraph available for cheap and frequent communication, there is probability that this session of Congress will consider the proposition more carefully and thoroughly than ever before. Although the session is but a few days old, two measures have already been introduced in the Senate, one by Senator Edmunds, which is the same measure proposed by him at the last session, and another by Senator Collum, which seems to aim at a thorough system, and proposes rates which will be of incalculable benefit. It proposes to build lines to many points at the East and South, and one overland to San Francisco. The style of the lines provided for by the Act, and the rates which it is contemplated to charge for the service, are of such wide interest that we give the following full abstract:

Postal telegraph offices are to be opened at the places named and at all intermediate points at which first, second or third-class postoffices are established. The bill provides that branch lines shall be constructed from time to time, as appropriations therefor are made by Congress, the intention being to connect the lines with all the cities where the postal free-delivery system prevails, but no additional facilities will be provided in States already connected with trunk lines until postal telegraph offices have been established in every State and Territory.

The system is to be constructed on straight lines or as near as practicable, but regard is to be taken of the cities that will afford the best telegraphic facilities to the public. The lines are to be constructed by the Engineer Corps of the army and then transferred to the custody of the Postmaster-General.

The poles are to be of iron, the wire of copper, and all other materials of the best character. Eight wires are to be strung on the line from New York to Chicago, and four upon the other lines. The Secretary of War is authorized to use the military service lines of the United States as far as expedient, and also to make all necessary condemnations of lands or buildings at a fair compensation, all disputes as to what is fair compensation to be settled by the Court of Claims. The Secretary is further authorized to construct, take and use all the machinery and devices, not including telegraph lines, whether patented or not, as shall be deemed necessary, the compensation to be determined in the same manner as in the condemnation of land. Sums of money necessary for this purpose are to be appropriated by this bill.

A rate of 10 cents for each 20 words and five cents for each additional 10 words is fixed for distances of under 500 miles, and an additional rate of five cents for each 250 miles over 500. A night rate of 35 cents, and a day rate of 75 cents, is fixed for each 100 words transmitted for newspapers, except that where the same dispatches are dropped off at more than one office, the rates shall be 25 cents, and 25 cents respectively for each dropped copy.

The office of Director-General of Telegraph is created as a part of the postoffice department. It is made the duty of the Postmaster-General to report to Congress after the passage of the Act a plan for the complete organization of the postal telegraph system with detailed estimates of the men and amount of money needed, before the system is put into operation and the employees selected. Examinations are to be held by the Civil Service Commission to determine the fitness of applicants. Four million dollars is appropriated for the location and construction of telegraph lines provided by the Act.

Such is the outline of the main features of the Act. We do not present them as the best that could be devised, but we do most emphatically approve the idea aimed at, and that is to make the telegraph of the fullest possible use, and to cheapen it to that end. The vast business interests and the communication of facts and ideas generally should not be at the dictation of private or corporate greed. It is no benefit to have competition cheapen rates until the conflicting interests are merged, and then, when they are merged, the price of a telegram raised again. This is the most injurious kind of a fluctuation. What would be the result of having the postage on a letter one cent to-day and five cents to-morrow? It is much the same, though to a less degree, in having telegraph rates dictated by the directory of a company.

It may be objected that the money called for by the Act is a large amount. It is so, and yet what investment of public money would confer wider benefits? Where is the sense in having surplus funds so large that the Government is compelled to build larger and larger vaults to contain it, while the people are being robbed of millions by the owners of telegraph lines? Let

the telegraph become a public necessity, as the mail service is. It may not pay its way at first; the mail service was a public burden until recently, if it is not now, and yet no one would advocate returning to high postage rates. This is a direction in which the Government can afford to experiment providing it is done wisely and honestly.

Power of the Soil.

In a land like England we can find an abundant evidence that the soil really needs neither rest nor rotation of crops to insure an eternal fertility. There is no wear out; there is no such thing as a garden becoming a wilderness by use, so long as there is a proper attention and a generous culture.

Towns and cities can be found there, where from 10,000 to 50,000 people have lived 1000 years. They have drawn their sustenance from the neighboring fields for all that time. Before the advent of fine highways, canals and railroads, more than ten miles of carriage was impossible. The farmers within that circle had a monopoly of the market. And to-day they maintain more people, have finer crops, pay higher rents, and thousands live better than ever, because the soil, generously treated, is exhaustless. Given a sufficient depth of soil, sunshine, rain, and the addition from time to time of such elements as are exhausted in the crop, and there is no end to fertility and resources.

California has soil and sun. Give it water to supply the wanting element and return to the soil proper fertilizers when it needs it, and there can be no failure of production. The sunshine is rather in excess. Efforts must be made for an equivalent supply of water. That is the chief want, and no land under the sun can provide so many cottage-houses with more pleasure or greater plenty.

We learn in a recent agricultural report from England that a farmer near one of those ancient cities sowed wheat for 45 years in the same field, without a break or rest, and the last crop was over 40 bushels to the acre.

This fact may well encourage the small farmer. It assures him that with proper culture and saving, and application of fertilizing matter, there is no real need of fallow or of extended acres. Enough for to-day is enough forever.

It will be a long time before the soil in some specially favored localities needs fertilization; in others, our experience has long shown that such crops as were gathered in the early days of California cannot now be had without restoring fertility to the soil. For this reason we are glad to see that increased attention is being paid to the introduction and sale of fertilizers and to the manufacture of the same from the offal of the great city. Our advertising columns during the last few weeks have borne witness to this fact. It will not be long before the use of fertilizers in this State will reach large amounts.

As an instance of the fertility of California soil in its best estate, we can but cite again the victory won by J. D. Roberts of Arroyo Grande of San Luis Obispo county, at a recent competition at the East. He won the prizes for the following articles: Onions 5 lbs. 2½ oz.; pumpkin, 274 lbs.; beet, 100 lbs. Many people had never seen such things before, and they were a matter of wonder. But with our soil and sun, with culture and water, nothing seems impossible.

Progress in Santa Cruz Mountains.

Among the many works of development and advancement in the very important district of our State known as the Santa Cruz Mountains may be mentioned the progress which E. Emil Meyer is making in the improvement of his excellent property, which he appropriately calls Mare Vista Vineyard. Mr. Meyer's place is 2000 feet above the ocean, and facing toward Santa Cruz has a magnificent sea view, whence the name he has chosen. We have seen a sketch of a wine-cellar which Mr. Meyer proposes to erect, and which has many novel and interesting features. It is impossible to present them without an engraving, which we may have when the enterprise has further progressed. It may be said, however, that the site has a sharp slope, and the arrangement is such that the grapes will be received from the roadway at the highest point, the wagons running upon a scale which is under roof. The crushing-room

is on the same level, and the fermenting-room is on a level below. Still lower is the floor on which are the casks, and from the fermenting vats to the casks the wine flows by gravitation. On the level of the cask-room is the excavation or cellar for the storage of old wines. Still on a lower level is the engine-room, and on a level lower the bottling-room. The distillery is apart from the main building, but on such a level that the wine will naturally flow to it. All the work can thus be done without an elevator, which is expensive to build and to operate. The terraces upon which the different levels are gained are to be laid up with solid masonry, for which excellent stone is found on the place and at a higher elevation than the building, so that all hauling will be down-hill. Mr. Meyer's building will have novel features in roof and in other parts which we can better describe when we have an engraving.

This year Mr. Meyer has made 5000 gallons of wine from his own grapes, but his vineyard is but beginning its bearing. He has 50 acres of resistant roots, 20 Californicas and 30 Riparias, which he will graft this winter with the 14 varieties from his experimental plot which seem to him most promising. These are, for white wine, Traminer, Green Hungarian, Franken Riesling, Mondeuse, Gutedel, Semillon, and three Sauvignons, which he has under special names, but whether they are all true varieties he is not yet sure. For clarets he will graft in St. George Pinot, St. Macaire, Tannat, Pinot de Peinaz and Gros Marsein.

In addition to his vines, Mr. Meyer is growing olives of which he has 22 varieties, and figs in variety. His place is young, but for beauty and productiveness gives good promise of its future.

The Rural for 1888.

We are approaching the close of one of the most active and progressive years in the history of California, and indications are that it is but the opening year of a wonderful period of development and progress. The growth of the State in all its productive interests has been great, as we propose to show clearly as soon as the year's statistics can be gathered. Though we are enjoying increased attention from those who seek sunny climes merely for health or enjoyment, still our growth over the whole State is chiefly by incoming of those who come to make homes and become factors in real wealth-winning.

In view of these facts, it becomes apparent that the sphere of the RURAL PRESS as the recognized leader in the agricultural literature of the State grows in importance, and its services to its growing community of readers become more valuable. We undertake to furnish to the new-comer practical information of methods and practices in this State which they can obtain from no other source, and at the same time we afford to the old and experienced farmers of California an opportunity to compare views and latest experiences, and thus help each other, and the new-comers as well, to put forth productive energy so as to reach the best possible results.

We are continually securing a wider circle of practical contributors and thus enriching our columns. We are keeping all informed of the progress of the newer industries, many of which are really being worked out in their details under California conditions, and to which distant experiences and methods drawn therefrom are of little value. We are working for greater diversity in the practical information we furnish, so that all may take such share as their conditions warrant in the unsurpassed breadth and variety of production in which California is destined to lead the world. We expect to do more for our readers in 1888 than we have done hitherto, and we ask it as a favor from those who have all along shown our enterprise such warm friendship that they speak to the many new-comers in their neighborhoods of the value they find in the RURAL as a practical guide in agriculture, as an entertaining and clean sheet for the family circle, and as an earnest advocate of the people in the face of oppression from all forms of greed. We desire to get in this word for the RURAL early, so that many may be induced to send their names for the opening of the next volume with the first issue in January. We expect to carry all old friends with us and to greet many new ones with an earnest wish for a "Happy New Year" to them all.

The Shorthorn Sale at Sacramento.

On Wednesday, the 7th inst., there were sold at the Sacramento Fair grounds 52 head of Shorthorn cattle, consisting of 48 heifers and four bull calves, belonging to R. M. Dunlap. The weather was fine and pleasant. The greater part of the Shorthorn breeders of the State being present, made a presentable gathering round the ring, so that there was not that bare and scant appearance of people one is but too apt to see at auction sales in this State. One attraction to Shorthorn-breeders in particular, no doubt, was the announcement that the cattle were to be sold by that veteran auctioneer of Shorthorn cattle, Col. J. W. Judy of Illinois. All we can say in regard to that is, that those who did not attend the sale missed a treat. We heard one man say: "I would rather hear him talk than sell cattle." That was before any cattle were sold, and most likely that man did not want any.

In his prefatory remarks, Col. Judy dwelt upon the advantages of keeping good cattle, under any circumstances, and whatever the breed chosen might be, let the cattle be good of their breed, with good constitutions, thus insuring good growing and thriving qualities and a power of keeping up under the heavy constitutional drain of giving large quantities of milk, and thus be ready to turn into a good carcass of beef when done with in the dairy. For this purpose it is generally conceded that the Shorthorn breed is the best. "The end of all cattle is beef," said the Colonel, very emphatically, "and the better the cattle, the better will be the quality of the beef produced, thus insuring a double gain in the increased weight for food consumed, and by having a better quality of meat, obtaining a better price per pound." If we have not got the exact words of the Colonel's speech, we feel confident that we have given the spirit and meaning of what he said.

And now to the sale. As usual, the bidding for the first two or three lots was slow, but the cattle being young and in good condition gave the people confidence, and when some of the good things—and there were some good ones—began to come to the front, the auctioneer's enthusiasm appeared to be contagious, or something like it, for some of our Shorthorn breeders began to warm up, and the bidding became lively and spirited, especially when anything above the average came forward. There were three animals that brought \$200 and over. These were: lot 12, Mazena 2d, bought by P. S. Chiles for \$200; lot 29, Red Princess, \$255 (the top price of the sale), bought by R. Ashburner, who no doubt knew the value of the first "Princess" female ever brought to this coast as well as any one present; lot 25, Blooming Health 7th was bought by Samuel Stewart for \$200. This was one of the best bred ones, and of a sort that generally sell for good prices where known for their good breeding.

There was one bull calf, Grand Duke 2d, of the same family, that was bought by Mr. Ashburner for \$150, a bargain, no doubt, but with some little risk attached to it, as the calf had been suffering from an attack of diarrhea, brought on by cold, and looked anything but well on the day of sale; it was thought that he would have brought double the money if he had been in blooming health, such as we hope to hear of him being in soon, under the judicious care of his present owner.

The 52 head sold for \$5225, a fraction over \$100 apiece—not quite as much as they were expected to bring, we believe; but, as the Colonel said in talking over the results of the sale, "the good things sold well, the lower priced ones not so well." However that may be, we heard of one of the largest buyers of the high-priced ones having sold 10 head at a profit before breakfast next morning to a person who had not seen the animals separately and individually—another proof of the truth of the saying: "Well bought, half sold."

Whether Mr. Dunlap will venture on bringing more Shorthorns from Illinois or any other State noted for its good cattle we did not hear, but we are glad to see the number of good cattle and the inquiry for such on the increase, and

whoever brings them here or breeds them is, in a certain sense, a public benefactor just as much so as the much-bepraised man who makes two blades of grass grow where only one grew before.

An Early Peach.

Many early peaches have been introduced, all laying claim to be superior to the "Alexander," such as Amsden, Brice's June, Gov. Garland, etc., but which, upon comparison, do not come up to the first named in quality and are no earlier in ripening.

A chance California seedling has been found called the "Ulati," which really does seem to be what the fruitmen in the early sections have been looking for. The Alexander must be picked very green, before it is fully grown, to stand very long shipments, but the "Ulati," which Mr. Leonard Coates of Napa is introducing is of much firmer quality, besides being larger and handsomer, and it ripens a little earlier.

Specimens were left hanging on the parent

AN EARLY PEACH—THE "ULATIS," A CALIFORNIA SEEDLING.

tree this year until dead ripe, when they were still firm and solid. Mr. Coates has reason to be proud of introducing so promising a fruit to the orchardists of California, and it would seem that in time seedling fruits originating in the State will supersede most of the older known varieties.

The Wool-Growers.

We publish upon another page some emphatic utterances by woolmen upon the proposition to put wool on the free list. It is evident that the wool interest will make a very strong appeal to Congress not to throw down the bars which even now afford but a slight protection to this industry which gives a livelihood to so many people. Since the date of the meetings to which we allude the telegraph has brought tidings of other meetings and other measures to avert the evil. At Salt Lake, on December 12th, the Chamber of Commerce authorized the chairman of its Wool Committee to call a general meeting of representatives of that industry for the discussion of the interests involved and for the preparation of resolutions. It was stated that the Idaho wool-growers would co-operate with the people of Utah in sending a delegate to Washington to protect their interests, and would gladly pay half the expenses. It is reported that the meeting was one of the largest ever held in the Chamber of Commerce, all classes realizing that free lead and free wool mean a dire blow at two of Utah's material industries.

The Potato Supply.

We have already alluded to the prospective potato shortage at the East and the likelihood that all which can be spared from this State will probably be taken at good prices if freight rates favor such shipment. Unfortunately our own crop was not large, so the amount to be spared from it will probably not cut much of a figure at the East. It is quite feasible, however, to turn out some fine new potatoes which will strike the Eastern market just when they will do most good to the growers.

To show just how great a decline there has been in this year's production, we give the figures of the total crop of the country for the last ten years, as stated by the statistician of the Department of Agriculture at Washington:

Years.	Bushels.
1879	169,000,000
1880	168,000,000
1881	109,000,000
1882	171,000,000
1883	208,000,000
1884	191,000,000
1885	175,000,000

1886	163,000,000
1887	134,000,000

Thus it appears that the product is shorter than any year except 1881. Pancoast Griffith of Philadelphia writes us that the short crop of the present season was largely of poor and un-keeping quality, and therefore will not equal the winter and spring supply here of 1881, which goes to confirm their previous prediction that potatoes should sell unusually high at the East this winter and next spring. The price in 1881 in Philadelphia ranged from 90 cents to \$1 per bushel, or \$1.50 to \$1.65 per cwt. This is not very high, and would hardly warrant carriage overland except at severely cut rates; but probably for a good California potato in the spring a better price could be had. The subject is interesting, at all events.

CHANGE OF FORESTRY COMMISSIONERS.—Hon. James V. Coleman has resigned his position on the State Board of Forestry, in order to devote his attention to private business, and the Governor has appointed John D. Spreckels to fill the vacancy. Mr. Coleman has been an earnest and active member of the board, and will be greatly missed by his late associates, Messrs. Kinney and Bettner.

DRIED BLACKBERRIES.—The picking and drying of blackberries is quite an important industry in the Piedmont section of North Carolina. The Chicago Herald says that a single firm in Greensboro lately shipped 18,000 pounds in one day to markets at the North.

QUERIES AND REPLIES

Killing Gophers.

EDITORS PRESS:—Will planting castor beans clear the gophers out of an orchard? If not, what are the successful methods?—SUBSCRIBER, Newcastle.

We have often heard of the castor-bean gopher-scourge, but only recall one case in which the writer declared on his own experience that it was effective. If it is, we should like to know it.

Scores of gopher remedies have been given in our columns during the last few years; perhaps it will be of value to many new readers to have brief statements of various methods of destruction. We therefore make the following compilation:

Wrap three or four grains of poisoned wheat (such as sold by druggists) in a Malva leaf and place the same in the gopher holes. A little strychnine, powdered and placed upon a slightly moistened leaf of Malva, will answer equally well. An orchardist of experience says he has succeeded this way in catching the old ones, which are too wary to be caught with traps.

Take plump raisins, open them part way at the stem end, and with the blade of a pen-knife drop in a little strychnine, close them up and drop in their holes. This is no doubt effective, but we have always feared to use it in a garden where children are running about, because if the gopher should happen to throw it out, the raisin is such an inviting object to a child that we have feared the consequences. We have had good success by using pieces of apple, cutting away all the skin, so that if it should be thrown out the moist piece would be covered with dirt and not look inviting to a child. A raisin having a dry exterior would not collect dirt, and would appear in all its charm if lying on the ground. Where there are no children about we would use raisins.

I never allow a day or two to go by without having the man go through the orchard with poisoned wheat in a bottle, with a spoon, and every hole he finds he reaches in the hole, as far as the spoon can go, a spoonful of wheat, and marks the place. We sometimes use poisoned carrots, leaving two pieces in each runway, one each side of the opening made. We have lost no trees for a year or two back.—T. C. De Long.

I consider the simplest and most efficient remedy to be the poisoned carrot, cutting the carrot up in small pieces and then putting poison and rhodium oil on it; I have never known the gopher to refuse it.—R. J. Trumbull.

Take a round-pointed stick and shove it in the ground near the gopher mounds until it strikes their trail, then put in a lot of poisoned wheat. Close up the hole with some grass, level down mounds, so if it don't kill all the gophers you will soon discover their new mounds. If there are many mounds I put the poison wheat in a number of places. I have kept them out of 25 acres of alfalfa with little expense for years in that way.—Franklin Ritter.

Take a piece of carrot; make it round about the size of a walnut; cut it into halves; pulverize some strychnine upon the back of a plate with a table-knife, very fine; spread it on each half to the outer edge; very little will do; put the halves together and run a piece of wood, skewer fashion, through them to hold them together, and roll it down the gopher hole. If you get tired of waiting to catch a hole open, open the last one closed up with a large spoon. This dose is a dead shot. I had a patch of carrots, and it attracted all the gophers in the neighborhood; but the runs are so full of dead gophers that I can't induce one to call upon me now. I have not seen a sign for weeks.—G. W. T. Carter.

Carbon Bisulphide.

Take old rags and make them into balls of about one inch in diameter (not tied very tight). Then take a flexible rod—a plum or cherry sprout is as good as anything, two or three feet in length. Split one end of it far enough back to open and hold a ball in the split end. Then dip the ball thus held in the bisulphide, which for the convenience of using should be poured into some open-mouthed vessel. As soon as the ball becomes saturated lift the rod with the ball attached carefully from the fluid in the vessel, letting it drain a moment. Then insert it with the aid of the rod, as far into the squirrel hole as convenient. Then suddenly withdraw the rod and the work is done. Repeat this process with all the adjacent holes. Stop with damp earth and stamp down. In this way a pound of the fluid may be effectually extended to 50 or 60 holes.—Wm. C. Blackwood.

Smokers.

Since the handy bellows for blowing smoke into gopher holes have been introduced, many have come to rely upon them for gopher destruction. We know orchardists who assured us not long since that they considered the smokers the solution of the gopher problem.

Trapping Gophers.

The most favorable time for trapping gophers is during the rainy season and in summer before

the ground becomes dry and hard. In order to trap gophers successfully a liberal supply of common sense and patience is very essential to the trapper. In the first place, the habits of the gopher must be studied and learned. It is well known that gophers come to the surface in the night, and generally close their holes in the morning soon after daybreak. They frequently emerge again about noon, and a third time late in the afternoon. It is best to set the trap in an open hole, as the gopher will be sure to return to fill it. Still the holes may be opened if the dirt is still fresh, with a good prospect of the gopher's return. Therefore the trapper may make his rounds three times a day, as above indicated. In the second place, care should be exercised in preparing the hole for the insertion of the trap. The trapper should assure himself that he has found a straight hole for a distance of at least 10 inches, with no lateral branches, otherwise the gopher in pushing out the dirt will likely enough thrust the trap to one side, cover it up or spring it without being exposed to its grasp.

In the third place, the trapper should be supplied with at least two varieties of traps—one for the larger gophers and the other for the smaller ones. The common iron gopher trap, which springs downward, is excellent for the former, and the small wire trap, which springs upward, is generally successful with the latter. It is taken for granted that the size of the hole is indicative of the size of the gopher. Either trap should be inserted nearly its full length into the hole, pressed down firmly, and a little dirt piled at the outer end to prevent its being easily pushed out. After the trap is set it is well to cover the opening with some grass or weeds. Sometimes the holes require a little enlarging, but care should be taken to make the fit as close as possible, that the body of the gopher may be kept near the center, and thus more exposed to the prongs of the trap.

In the fourth place, the trapper should have a small spade and a little gouge-shaped implement for trimming the hole.

Gopher Pitfalls.

"About the 1st of June, when grass and grain are drying up, the little animals go foraging on the surface during the night, and must be provided against. This I did very successfully by cutting around the tract a smooth ditch, the width and depth of the blade of a spade. At intervals of 50 yards or more, I sunk a hole in the bottom of the ditch, and placed in it an old five-gallon coal-oil can, leaving the mouth open, and level with the bottom of the trench. The first morning I took 39 out of the cans, and averaged 20 to 30 every morning, until the neighboring cats took them out as fast as they got in. I then soon got rid of those inside the tract. The ditch must be kept clean, and if any roads cross the tract, set up a board at night, to compel them to tumble in the ditch."—H. W. Crabb.

HOW THE FISH GOT THERE.—The Truckee Republican suggests the solution of a problem referred to by one of the RURAL's correspondents some weeks ago. It may be remembered that the water from a hot artesian well in Sierra valley, after flowing a short distance, had formed a small pond where before there was only a dry depression in the ground without communication with any other stream of water, and that a short time after the formation of this pond numbers of small fish were to be found in it. The query was how they got there, or how was the spawn deposited, it being unreasonable to suppose that they came from the well, for they would have been cooked, and fish spawn cannot retain any vitality in dry ground. The question admits of but one solution, namely, this: Most of the brook minnows lay their eggs upon water-grasses and other aquatic plants. Their eggs being glutinous, adhere to the grass and other plants, mostly near the surface of the water, and wild duck swimming among them gather large quantities of the eggs upon their feathers. There are some varieties which feed mostly at night, visiting small ponds and even temporary large mudholes. Impregnated fish eggs are thus transferred in their feathers and become detached in whatever water they alight. The streams of Sierra valley are full of minnows and it is also a great resort for ducks. It is highly probable that ducks visited this newly-formed pond with fish eggs on their feathers and thus stocked the pond with fish.

AGRICULTURAL DIRECTORS APPOINTED.—The Governor issued commissions on the 8th inst. as follows: H. C. Ransome of Del Norte and G. C. Barber of Humboldt, directors of Agricultural District No. 9; Geo. H. Bragg of Santa Clara, J. R. Weller of Santa Clara, directors of Agricultural District No. 6; P. Plumey of Alameda, Samuel Ganble of Contra Costa, George Bement of Contra Costa, directors of Agricultural District No. 1; M. L. Marsh of Nevada City, a member of the District Board of Agriculture for District No. 17, vice George L. Threshkill, term expired; also, J. W. Thompson of Quincy, Plumas county, and J. J. Reavis of Bieber, Lassen county, members District Board of Agriculture No. 11.

MEXICAN ORANGES FOR CHICAGO.—A Guaymas dispatch speaks of the orange exports from Hermosillo and Guaymas as very important, three different American parties having bought the entire crop, which amounts to 40 carloads, one-fourth being from Aranjuez, the most celebrated orange grove in Sonora. The exports are mostly for Chicago.

ENTOMOLOGICAL.

Other Washes for Scales.

Last week we gave the first part of a bulletin issued by the State Board of Horticulture, giving washes for scale insects. The following are additional remedies for scales and for other pests:

Peach Moth—(Anarsia Lineatella.)

The first brood of worms bore into young limbs of peach trees, the second into the fruit. The bulk of the pupæ evidently harbors in the ground. Dusting with gas lime, in about the same manner as for woolly aphis, might prove a remedy. Any infested limbs should be cut off and burned, and no hiding-places for them allowed. It is in the spring that they show their work most plainly, by the withering young shoots. These must be cut off and destroyed. Spraying during winter with any of the winter washes is recommended, as it has been found that since spraying of peach orchards for the purpose of killing scale insects, much less of the moth has been seen.

Codlin Moth.

The fighting of this insect must be principally done in the spring and summer, the line of defense being indicated in my report. The winter work must consist in reducing the hiding-places of the cocoons. As these are often found many inches below ground, the soil around the tree should be removed and the bark scraped. If the trunk has very rough bark, it also should be scraped; and if it is covered with lichens or moss give it a spraying with a weak solution, the strength of which is indicated above.

Woolly Aphis.

Gas lime (used with moderation), the refuse from gas works, is both a lasting destroyer of the insect and a fertilizer. Use from 1½ to 2 shovelfuls of fresh gas lime per tree, spreading it over the surface around the tree to cover about six feet in diameter. If the soil is deep and well-drained, a much larger quantity may be safely used. Care should be taken not to pile the gas lime around the neck of the tree, as the solution of gas-water formed by the rains might scald the bark. To prevent possible migration from the roots to the upper branches, place a shovelful of fresh ashes around the base of the tree. The dressing with gas lime should be done as early as possible, so that the rains may have full effect on it and carry it into the ground. For the form of woolly aphis infesting the top, the daubing of kerosene on the infested knots is a fair remedy; also the following rosin solution, originally recommended by Prof. C. V. Riley: Four pounds of rosin, 3 pounds of sal soda; water to make 36 pints. Dissolve the sal soda in a few pints of water. When thoroughly dissolved, add the rosin. Heat until dissolved, and add water finally. For aphis use 1½ pints of solution to the gallon of water. Use at a temperature above 100° F.

This remedy has also proved an excellent one for the plum aphis, and is applied in spring, as soon as the aphis makes its appearance.

A Summer Wash.

Recommended by Sol. Runyon of the Sacramento river for scale-insects on deciduous trees—sprayed on fruit.—Ingredients for one barrel of 50 (measure) gallons: Weight about 450 to 500 pounds: 10 pounds caustic soda, 98 per cent; 10 pounds potash; 40 pounds tallow; 40 pounds rosin. First—Dissolve the potash and soda in 10 gallons of water. When dissolved, place the whole amount in the barrel to be used. Second—Dissolve the tallow and rosin together. When dissolved, add the same to the potash and soda in the barrel, and stir well for five minutes or so. Leave standing for about two hours; then fill up with water, stirring well as every bucket of water goes in. Use the following day, one pound to the gallon of water; apply warm.

Lime, Sulphur and Salt.

The following remedy was highly recommended by the Tulare County Horticultural Commissioners, who claimed that they had obtained better results with this than from the use of caustics: 25 pounds of unslacked lime, 20 pounds of French sulphur, 15 pounds of common salt. To mix the above take 10 pounds of lime, and 20 pounds of sulphur, and 20 gallons of water; boil until the sulphur is thoroughly dissolved; then take the remaining 15 pounds of lime and 15 pounds of salt; slack the lime, and add enough water to make the whole 60 gallons.

A Similar Remedy.

In this connection we publish a similar remedy, said to have been first used by Mr. A. T. Covell of Fresno county. Mr. Covell's remedy is: 50 pounds of unslacked lime, 20 pounds of French sulphur, 15 pounds of salt, prepared as follows: Place 10 pounds of lime and 20 pounds of sulphur in a heater with 20 gallons of soft water. Boil for half an hour or more, until both lime and sulphur are dissolved. The sulphur must be thoroughly dissolved and mixed with the lime; the mixture will then be of an amber color. Next place in a cask or box 40 pounds of good lime and pour upon it enough soft, hot water to thoroughly slacken the lime and keep it in a liquid form. After the lime is thoroughly slacked, add 15 pounds of common stock salt while the material is hot. When the salt is well dissolved mix the two lots together, with sufficient water to make 60 gal-

lons of spraying material, which will then be a thin whitewash. The material should be strained after being thoroughly mixed—a good piece of burlap answering well for the purpose. Apply the mixture with a spray pump, using a rubber plate in the nozzle instead of the brass plate.

Notes from a Texas Reader.

EDITORS PRESS:—It has always been my desire to visit your State, but as circumstances would not admit, I have contented myself with subscribing for your paper. As there is a great similarity between the climates, your paper is especially valuable here, for every one that can irrigate does so. I only have a small piece of ground that I can irrigate, but your paper has been a cheap investment, because I have to learn from the experience of others whose whole interest depends on it.

Hardy Vines.

I have tried 32 different kinds of foreign grapes, and so far have found but two that will stand our late frost with impunity. One is called the White Calable. It may be of interest to some one to know what it will stand here. One year it put out and set a fruit in the middle of March. There came a freeze (not a frost) and killed out all I had but this one. I had the Mission vines five years old, doing well, the main stems being two inches in diameter. The White Calable it only killed off the green wood and the vine put out again apparently as pretty as ever. In April there came a frost and killed off this crop, but to my astonishment it and the Black Spanish put out again. It seemed to me that the crop that set again matured better fruit than ever, for some bunches weighed over two pounds, the best I ever got. While the Black Spanish is just as hardy, the fruit won't stand much wet weather. Irrigate with limestone water, hence my land gets so heavily charged with lime that some varieties won't grow at all.

Cactus Fodder.

In your issue of November 26th I read the piece headed "Cactus Fodder" with much interest. You ask for experience from some one that has fed it to stock. I have been feeding the prickly pear 10 years, and I can tell you in any region that is subject to severe drought like this it is hard to beat for milk cows—if it is used right. I go out in bad weather and build up a fire and burn the stickers off a lot, and pile them up where they are handy to get at. I would recommend scorching them thoroughly, as it checks that tendency they have to relax the bowels too much. In feeding my cows I give each a washpan full of cottonseed: ditto bran; and then I cut up with a butcher-knife a five-gallon bucket full of prickly pear. I give this night and morning. Sprinkle a little salt over the green pear. If anyone reads this who has nothing green to feed to his milk-stock, just try it and see for yourself the difference in the yield of milk. I think enough of the cactus to plant them out in all of the out-of-the-way places. I throw a leaf down and throw a shovelful of dirt on one end and it takes root. This feed is not good alone. Double the quantity of bran is just as good as the cottonseed. I have a cow that has acquired such a taste for the cactus that she will go off and eat them fresh with the stickers on. She gets her mouth so full of sticks that she can't shut it; she has done this for three winters. I don't see that she looks any the worse for it.

Texas.

From the way people are pouring into your State it does seem to me that they will have to swarm, and, as Texas is the only State where they can get good cheap lands, I think we may soon look for a boom here, for it is going to rain again here, and when we do make a crop here we make it all. I like to read in your paper of the great yields of your soil, and it may be of interest to some of your readers to know what we can do here, for this drought has been greatly exaggerated. My neighbor, who never fails to raise small grain, raised one year 52 bushels of wheat to the acre, and some of them on choice land make 90 bushels of corn to the acre. There was one year that my bees did so well that I thought I would put the best stand I had on the scales to see how much they were bringing in each day. That stand increased until it brought in 15 pounds of honey in one day. The bees were working on horse-mint mostly, and the honey after getting fully ripe is quite good enough. Horse-mint is the best honey plant we have here, but this year it was so unusually dry that I don't think I got anything but Mesquit honey, which only comes in these extreme droughts. When I used to attend a vegetable garden, I have sold many a cabbage for 50 cents each. I never could supply the demand for strawberries at 50 cents a quart and other things in proportion. I have raised the Sharpless strawberry that measured over five inches around.

As you are all ahead in most everything, I sent some pecans to a man in your State, who had 10,000 pecan trees that he planted. I sent him some samples of mine, asking him if he had anything better to return the compliment. He wrote me he did not have anything so good, but if I would send him some grafts off that tree to send the bill with it. Respectfully yours,

E. E. RISSEN.

San Saba, Texas.

Santa Cruz and Environments.

EDITORS PRESS:—Much as I had previously heard of the attractions of Santa Cruz as a place of resort or permanent residence, a visit to the place in person was necessary to a full realization of its just claims. It is a lovely place. Even the inclemency of the weather during my stay of three days at the opening of the present month was not enough to conceal its charms, though naturally things could not have so bright an appearance to the stranger as they would present under glowing sunshine. The city contains a permanent population of about 5000, and during the summer season a transient population of 1000 or 2000 more, who come to bathe in the placid bay, and recreate in the elysian atmosphere that perpetually hangs over it during the season. The engraving on the opposite page shows the appearance of the beach during the season. As one would expect in a place chosen for residence, it contains many really elegant homes, and even the less pretentious dwellings are almost invariably surrounded by beautiful grounds ornamented with a great variety of flowers and shrubbery.

The principal street, Pacific avenue, being covered with asphaltum, affords an excellent drive at all seasons.

The assessable property of the city, as obtained from the assessor's books, is \$2,049,359 net, which, taking into consideration the fact that but little manufacturing is carried on, is not a bad showing.

The Development Association of Santa Cruz, composed of some of the most wide-awake and enterprising men of the city and county, is doing a good work in bringing to the knowledge of the outside world the wonderful undeveloped resources of Santa Cruz county. To the courteous and efficient secretary, I. H. Raymond, I was placed under many obligations for favors while staying there. The people of Santa Cruz owe it to themselves to do all in their power to encourage this association by which they are so ably represented.

On my way to Santa Cruz by the coast road from San Mateo, I had occasion to visit many fine dairy farms, among the most extensive of which was that of G. P. Laird of Davenport, consisting of 2600 acres with barns, dairy and outbuildings in keeping with the size of the place, upon which the proprietor maintains 200 head of good dairy cows.

We spent Monday night with Mr. Dingwall, proprietor of Davenport hotel, Davenport. Mr. Dingwall has the faculty of making his guests feel at home. Davenport was, some 20 years ago, one of the liveliest places along the coast between Frisco and Santa Cruz, being a shipping point for a considerable section of country, the commodities being lime, lumber, and tanbark. The decline in such industries took place about ten years ago, but there are yet visible many signs of the business activity of that period, and doubtless when the coast railroad is built, which is but a question of time, Davenport will again figure prominently as a business center. The inexhaustible supply of lime rock in the neighborhood will some day prove an immense source of wealth to the country.

The San Vicente ranch, two miles from the landing, has an extensive supply of rock from which large quantities were shipped in former years. This tract of land is owned by Reese, Davis & Co. of your city.

On Saturday morning, the 3d inst., the weather presented some tokens of clearing up, and I concluded to drive up into the Ben Lomond settlement to obtain some facts of interest to your readers regarding the fruit-growing and wine-making industries for which that section is becoming favorably known. Following what is known as the Empire Grade, the first place that attracted my attention as worthy of special notice is the fruit farm of P. T. Stribling, four miles from town. This gentleman has an orchard of 20 acres of the choicest varieties of fruit, samples of which I examined, and must say were fully equal to the best I have seen throughout my travels of the season. The elevation of Mr. Stribling's farm is 1000 feet, and seems to be a favorite region for oranges and lemons. One orange tree to which I paid particular attention, four years from the seed, contained 25 fine, large oranges. Some months ago a quartz ledge, specimens from which assayed \$75 per ton, was discovered on Mr. Stribling's farm, and now the proprietor has a five-stamp mill in operation, and some startling developments therefrom are not among the improbabilities of the future. This prediction is not based upon a superficial foundation, from the fact that in the early fifties there was a boulder discovered a short distance from here from which over \$40,000 was obtained. The lucky discoverers were Mr. F. A. Hihn and others. The former gentleman now ranks as the richest man in Santa Cruz county.

Mr. A. G. Rose, adjoining Mr. Stribling, has also a very fine young orchard of about 35 acres.

The next gentleman we called upon was Mr. Geo. W. Peterson, who is also extensively engaged in fruit-growing.

Thence 1½ miles, still up-grade, I come to the Ben Lomond Wine Co.'s vineyard and winery, of which J. F. Coope, Esq., is a shareholder and the manager. Darkness had now set in and I accepted with alacrity Mr. Coope's kind invitation to dine and remain over night. The next morning I was shown through the wine-cellar,

which contains 30,000 gallons ready for shipment, the product of this year. Mr. Coope has here 70 acres in vines, 30 of which are in bearing. The company own 500 acres of good land here, which they are planting to vines as fast as it can be cleared. Everything about the place is done after the most approved system. The land even is cleared by steam. The apparatus for grubbing is the invention of Mr. Coope. He pulls up the trees of 10 acres without removing the machine or engine. A tree four feet in diameter is lifted out of the ground in the incredibly short space of three minutes. His wine-house also displays like skill and ingenuity in its arrangement. It is built on the slope of a slight hill, the ground on the upper side of the building being even with the second story, so that the wine grapes can be unloaded on the second floor, and the barrels in the lower story can be filled from the vats above with the least possible labor. Then when it comes to shipping, three tons of wine are loaded in 10 minutes by means of an elevator, requiring but two men to operate it. Mr. Coope makes the Riesling wines a specialty. Besides what is grown on the company's farm, all the wine grapes of the settlement are purchased and made into wine at the Ben Lomond winery. This elegant vineyard, though 2500 feet above the sea, and being within a few feet of the very summit of the Coast Range, is fortunately blessed with an abundant supply of good water—an important factor in the successful production of good wine. A reservoir containing 120,000 gallons of water stands just above the winehouse.

An hour before sundown the rain, which had been falling almost incessantly for 36 hours, ceased, the clouds suddenly vanished, and the sun shone forth in all his glory. Without the least exaggeration, I can say I never beheld a richer scene than lay before me. Standing upon the very summit of the highest mountain within 20 miles, I gazed in profound admiration upon a panorama more magnificent than seemed pos-

sible for an artist to produce on canvas. To the south and west five miles, but seemingly only a few steps below my feet, lay the shining waters of the Pacific. Southeast 10 or 12 miles distant was spread out the beautiful city of Santa Cruz. Eastward towered 1500 feet above me Loma Prieta, and a little farther to the left could be distinctly seen Mt. Hamilton, crowned with the Lick observatory, the brass mountings of which glittered in the effulgent

THE VETERINARIAN.

Is It Anthrax?

EDITORS PRESS:—It must be evident that when careful and thorough details are not given, it is impossible for a veterinarian to say positively the cause of death. "Subscriber"

it is necessary to personally examine the post and ante-mortem. It looks very much like that disease termed "anthrax." And I would advise the owner to be careful to satisfy himself whether it is or not, because this ailment is a dangerous malady and is extremely likely to affect the other live-stock. In a previous issue of the RURAL may be seen a long letter, in reference to cremation of animals affected with anthrax, and other matters relating to the disease generally. The fact of two animals having died points to the probability of some disease affecting all the animals. Let "Subscriber" pass his hand over the skin of the remaining affected animals, if any, and if he notices a crackling sensation, it indicates, to some extent, the above-mentioned disease. Then let him take some of the blood and examine it under a microscope; or, if not accustomed to the use of that instrument, it would be well to get some physician or some one understanding the affair to manipulate. To one having once seen the "bacillus anthracis," he will easily recognize them. Lameness in one limb, especially the hind quarters, is somewhat diagnostic of anthrax. Make inquiries, also, as to the previous history of the animals, as to whether any diseased cattle have been buried in the pastures where they have been fed. Let "Subscriber"

SCENE ON THE BEACH AT SANTA CRUZ IN THE RIGHT OF THE SEASON.

rays of the sun. Then the stately redwoods, clothed in evergreen foliage, studing the sides and crowns of the hills on every side, interspersed with neat homesteads, vineyards and orchards, was, taken all in all, truly a soul-inspiring picture to behold, and well worth all the vexation I experienced the day before in wearily dragging through the mud 15 miles up-grade with the rain beating me mercilessly in the face and causing me to almost wish I had been born on another planet or not at all.

L.

THE 17th District Agricultural Association's fair-grounds and other property were sold by the sheriff, December 8th, to satisfy a mortgage.

says that "he found a young steer dead, without any apparent cause; last evening another came home lame in the left shoulder; this morning it died. When the hide was removed, the shoulder was swollen, the blood of vessels covering the fore leg seemed to have ruptured, causing blood to be diffused all through the muscles of the fore leg, the muscles under the belly were in same condition, as was stifle joint of right hind leg. The heart and arteries leading to it were charged with clotted black blood. What is the disease? Is there a remedy? If so, what?"

These particulars are much more explicit than are usually given in such cases. But, of course, to make a correct and certain diagnosis,

make further inquiries, and let me know, and we shall be pleased to afford any further answers to question.

Time for Settlement.

Before the new year savings in upon our circle we hope all old subscribers who have been indulged with credit on our books will honor our confidence, square up the record on our large mail-list, and make things lovely with the publishers by payment for another 12 months in advance.

We intend that our old friends shall patronize a still better journal for 1888, although we have not been lacking in enterprise and costly efforts for our readers in the past.

If you cannot keep ahead in your accounts with every one, let the publisher, who furnishes food for the mind and soul—the highest qualities of manhood—be the first, rather than one of the last, to be paid; yet the very last rather than one of the first to part company with if, perchance, economy forces you to sever relations with any old providers.

The late expensive improvements made in issuing our journal in its present style, together with the approach of the new year, and further betterments for the benefit of our readers, renders it important that all pay up arrearages and remit in advance for 1888.

Please do not wait for further notice or louder calls, friends. Can you not afford to owe any business man in preference to an editor or publisher? You cannot, however, dispense with any other desirable article with so irreparable a loss as a good newspaper.

Dec. 3, 1887.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

W. R. STRONG & Co. have issued their catalogue of seeds, plants and nursery stock for the winter of 1887-8 in a handsome illuminated cover, which is beautiful in design and expressive of the growths and horticultural industries of the State. The planter will find a great variety of things suited to the different parts of this State, and its pages should be studied.

FELIX GILLET of Nevada City sends us his new catalogue, which shows that he is progressing well with the especial line of nuts and fruits for which he has secured a name all over the State and beyond. Mr. Gillet prepares his catalogue with great care and readers find much practical information in it aside from his business announcements.

INVITATIONS ACKNOWLEDGED.—We are indebted to Mills College for a cordial bidding to the "Musical and Rhetorical," on Friday evening, Dec. 3d; also to Rev. E. B. Church for a courteous invitation to the closing exercises of Irving Institute, in this city, at 2 o'clock that same afternoon.

STATE BOARD OF SILK CULTURE.—In answer to a correspondent, and for the information of any others who may not know, we state that the office of the State Board of Silk Culture is No. 21 Montgomery avenue, San Francisco.

The Olive as a Standard Tree.

W. M. Boggs, Commissioner from the Napa district, in his report to the State Board of Horticulture, has this to say about the remarks recently published, that the olive should not be trained as a tree, but rather as a bush with extending limbs, so that the fruit may be gathered by hand without bruising: "I will simply say that the method recommended will not be the course that olive growers will pursue in California. The 'dwarfing' of trees in California was extensively experimented on in the earlier days of fruit-tree planting. I should much prefer to follow the advice of such men as Ellwood Cooper, Mr. Pohndorff and Mr. Flamant than to follow or look to a European method or to a European for advice as to the planting and training of trees in California. They will have to come to the California methods of doing the work both in tree culture and viticulture. Our soils are new and not exhausted. Our land is not limited to terraced hillsides and rocky flats. There is no scarcity of land and no necessity for crowding our orchards or dwarfing our trees, and also dwarfing our fruits. The larger and more thrifty our trees the better the quality of our fruits, nuts and oil. Mr. Block of Santa Clara remarked before the board at our last meeting: 'I would prefer the advice and opinion of the American plowboy to one of these foreigners on the cultivation of the soil in America, and as to gathering the fruit, trust to Yankee ingenuity for the rest.'"

A Sure Thing.

There are very few things in this life of which we may be absolutely certain, but this is one of them: that Dr. Pierce's "Pleasant Purgative Pellets" have no equal as a cathartic in derangements of the liver, stomach and bowels. They are very small and their action is pleasant. Purely vegetable, perfectly harmless. 25 cents a vial. All druggists.

To Consumptives.

Reader, can you believe that the Creator afflicts one-third of mankind with a disease for which there is no remedy? Dr. R. V. Pierce's "Golden Medical Discovery" has cured hundreds of cases of consumption, and men are living to-day—healthy, robust men—whom physicians pronounced incurable, because one lung was almost gone. Send 10 cents in stamps for Dr. Pierce's book on consumption and kindred affections. Address, World's Dispensary Medical Association, 663 Main St., Buffalo, N. Y.

The Beauty of Woman

Is her crown of glory. But alas! how quickly does the nervous debility and chronic weakness of the sex cause the bloom of youth to pass away, sharpen the lovely features, and emaciate the rounded form! There is but one remedy which will restore the faded roses and bring back the grace of youth. It is Dr. Pierce's "Favorite Prescription," a sovereign remedy for the diseases peculiar to females. It is one of the greatest boons ever conferred upon the human race, for it preserves that which is fairest and dearest to all mankind—the beauty and the health of woman.

Thorough Cultivation.

One word in regard to the profit resulting from a proper preparation of the soil. And as one example will go farther than a great many precepts, the case of a farmer of Shawnee county, Kansas, may be mentioned. He took especial pains to make the soil compact for his wheat sown in October. At the harvest in July he thrashed out 56 bushels and 30 pounds per acre of wheat weighing 61 pounds per bushel. And no doubt the majority of farms in the United States are fertile enough to produce as much as this, if the crops were not damaged through the poor mechanical preparations of the ground against which manure or natural fertility cannot prevail. The average yield of wheat is 15 bushels to the acre. No doubt with perfectly prepared soil this yield would be double. What then is the actual value to the farmer of an implement that is perfectly adapted to this requisite preparation of the soil, such as the "Acme" Pulverizing Harrow, Clod-Crusher and Leveler has proved itself to be beyond all question of doubt.

A prominent agricultural writer, who is a practical farmer, after demonstrating clearly that an increase of five bushels of winter grain may be obtained with one dollar's worth of extra pulverization of the soil (a net increase in money value of \$4 per acre above cost), says: The great benefit conferred on farmers by a general introduction of the "Acme" Pulverizing Harrow, Clod-Crusher and Leveler becomes obvious.

ZANTE CURRANTS.—We have received a very beautiful little souvenir box of Zante currants from Mrs. J. W. Pew of the Mirabelle vineyard, Fresno. The currants are as good a sample as we ever saw produced in this State, excellent color and flavor and clean. The style of packing is excellent. Such a product must become a favorite in the market.

BYRON JACKSON, 625 Sixth St., San Francisco, Cal.

For quantities of water not less than 100 gallons per minute, and for lifts not exceeding 100 feet, there is no better pump than that illustrated in the annexed engraving. It is very simple, durable, and economical. I make them in sizes from 2-inch, 100 gallons per minute, to 24-inch, with a capacity of 14,000 gallons per minute, and am prepared to build larger sizes to order. They must be set within 20 feet of the water; will draw it that far and force it up 90 feet. They are very satisfactory in wells not over 100 feet deep.

Farmers and Fruit-Growers, Attention!
To grow large and profitable crops and at the same time to make the farm
better each year, is the problem for the farmer.
FERTILIZE! FERTILIZE!
NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.
DR. J. KOBIG—Dear Sir: I have analyzed your sample
of "Nitrogenous Superphosphate," with the
following result:
Soluble Phosphoric Acid.....12.90 per cent
Reverted Phosphoric Acid......95 "
Insoluble Phosphoric Acid......2.83 "
Potash.....2.23 "
Ammonia.....1.87 "
Nitric Acid.....2.95 "
The above amount of Nitric Acid is equal to 0.85
per cent Ammonia, therefore, total of Nitrogen calcu-
lated as Ammonia, 2.72 per cent.
This Fertilizer is a Valuable Manure for vine-
yards, orchards, gardens, farms, and I recommend its
use by the cultivators of the soil generally, in Cali-
fornia. Yours truly,
DR. E. A. SCHNEIDER.

University of California, College of Agri-
culture.
BERKELEY, Nov. 20, 1886.

DR. J. KOBIG, San Francisco—Dear Sir: I take pleasure
in adding my testimony to that of Dr. Schneider as
to the high quality of the "Nitrogenous Super-
phosphate" Fertilizer, analyzed by him at your re-
quest. It is a high-grade article, and as such re-
turns the user a better money value than a low-grade
fertilizer. It is especially well adapted to use in
California, on account of the predominance in
it of Phosphoric Acid, which is generally in small
supply in our soils. Yet it is desirable that "com-
plete" fertilizers be used in our orchards and vineyards,
and yours is of that character in furnishing
Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

A GREAT OFFER.

In order to extend our list of names, we will put into a box a card bearing the name of each person who sends
us the names and post-office addresses of ten young gentlemen or ladies between the ages of 15 and 25 years, who
would be likely to attend a Business College or Normal School. These names must be sent in before the 4th day of
February, 1888. On that day Messrs. Trask & Ramsey, in the presence of the whole faculty of the Business College
and Normal Institute, will draw out the names of five persons, to whom will be presented the following scholar-
ships. These scholarships will entitle the persons to whom they are issued to instruction in the largest and best
conducted private school on the Pacific Coast.
BUSINESS COURSE, six months, \$50.
SCIENTIFIC COURSE, one year, \$50.
SHORT-HAND AND TYPE-WRITING, 6 months, \$50.
NORMAL COURSE, one year, \$50.
TEACHER'S REVIEW COURSE, nine months, \$50.
CONDITIONS.—Applicants for any one of these five scholarships must be between the ages of 15 and 25 years, and
must not be residents of Stockton.
A person drawing either one of these scholarships can have his choice of either of the five courses of study
named above.
Write your name and post-office plainly, and state which one of the scholarships you are an applicant for.

S. E. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Dec. 14, 1887.

Showery weather the past week in several agricultural districts caused more plows to start in those favored sections, but, as a rule, good soaking rains are wanted everywhere in this State. Considerable attention is drawn to Congress to see what will be done on the tariff question. Leading wheat-growers think that free coal (duty is \$2 per ton) will benefit wheat by sending more vessels here with coal that will take wheat away; it is also claimed that cheaper tin (duty free) will hold fruit-canners, and therefore fruit-growers. But these wool-growers, as a rule, believe that a reduction in wool will lower the price on that product, so that it is hard to please all. The grain markets at the East and abroad hold strong, contrary to all former years around the holidays. To-day's cable is as follows:

LIVERPOOL, Dec. 14.—Wheat—Easier. California spot lots, 63 1/2 d @ 63 9/16 d; off coast, 34 1/2 @ 34 3/4 d; just shipped, 34 3/4 d; nearly due, 34 1/2; cargoes off coast, slow; on passage, slow and probably cheaper; Mark Lane wheat, weaker; wheat on passage to Continent, 204,000 qrs.; wheat and flour on passage to U. K., 1,561,000 qrs.; wheat and flour in Paris, quiet; sea here in English, showery.

Foreign Review.

LONDON, Dec. 12.—The *Mark Lane Express* says: English wheat is decidedly weaker. The demand has lessened, while the damp weather has tended to deteriorate the condition of grain. The sales of English wheat during the week were 66,838 quarters at 31s 2d against 68,345 at 33s 1d for the corresponding period last year. Foreign wheat is further depressed. The mild weather on the Baltic and Black Seas enables a continuation of extensive shipments, which combined with the large stock and increased arrivals of American flour have made trade slack. The values of English and foreign wheats were unaltered in today's market, but all kinds were slow of sale. Flour is dull.

Eastern Wool Markets.

NEW YORK, Dec. 12.—Wool is quiet. The manufacturers are buying only for their absolute wants.

The President's message causes considerable comment, and there are dealers who predict additional dullness until Congress settles the question involved. Sales: 20,000 lbs. X and XX, 31 @ 33 1/2 c; 10,000 lbs. Delaware fine, 35; 10,000 super pulled, 36 @ 37 c; 50,000 lbs. Montevideo, 25 @ 25 1/2 c; 35,000 lbs. Eastern Oregon, 16 @ 19 c; 50,000 lbs. Territory, 17 @ 24 c; 25,000 lbs. Spring California, 14 1/2 @ 19 c; 30,000 lbs. scoured California, 40 @ 49 c; 24,000 lbs. spring Texas, 21 @ 22 1/2 c; 10,000 lbs. black, 13 c; 12,000 lbs. scoured spring, 50 c; 342,000 lbs. on private terms.

At Boston, trade is good; Philadelphia is quiet.

California and Foreign Raisins.

NEW YORK, Dec. 12.—Five brands of California raisins are quoted in the market to-day. Two Crowns L. M. are \$1.65 @ 1.75; Three Crowns L. M., \$1.90 @ 2.25; Three Crowns, London, \$2.15 @ 2.30. Foreign raisins are quoted as follows: Two Crown, loose new Malagas, \$1.75 @ 1.80; London layer new Malagas, \$2.75. The packages of foreign raisins are not uniform in size with the California packages.

Eastern Grain Markets.

NEW YORK, Dec. 14.—Wheat—12 M. 89 1/2 @ 89 3/4 c for cash, 87 1/2 c for Dec., 88 1/4 @ 88 1/2 c for Jan., 89 1/4 @ 89 1/2 c for Feb., 90 1/4 @ 90 1/2 c for March, and 92 1/2 c to 92 3/4 c for May.

Dried Fruits.

NEW YORK, Dec. 12.—Dried peaches still are salable at 27 @ 28 c; apricots, 17 @ 36 c; prunes, 13 @ 15 1/2 c. Canned cherries, \$2.60 @ \$2.65 per dozen.

Miscellaneous.

NEW YORK, Dec. 12.—The stock of walnuts has been absorbed.

For yellow mustard seed there is no call. One-pound boxes of comb honey are popular here. State is quoted at from 16 @ 17 c; strained, 9 c. Hops are positively flat.

The steamer Colon, which arrived on Wednesday, brought 4993 bags beans, 1013 bags mustard seed and 7620 sbs barley.

Local Markets.

BAGS—Spot dull and easy, but June-July delivery are steadily held at 7 1/2 c to 7 3/4 c.

BARLEY—The past week has witnessed a strong market for both sample parcels and futures. Operations on Call have been quite active, but the fluctuations were small. To-day's sales are reported as follows:

Morning Session: Buyer season—800 tons, 97 1/2 c; 200, 97 1/2 c; 200, 97 1/2 c. Buyer 1887—300 tons, 87 1/2 c; 100, 87 1/2 c @ 87 1/2 c. Afternoon Session: Buyer season—400 tons, 97 1/2 c; 400, 97 1/2 c; 200, 97 1/2 c @ 87 1/2 c.

BUTTER—The market is easy and in buyers' favor, owing to improving pasturage increasing the supply, and dealers pressing the market with old stock.

CHEESE—New scarce and strong but old, in good supply, with the market soft.

EGGS—Accumulating stocks cause some shading, particularly for consignments held a few days.

FLOUR—The market is gradually gaining strength, but no advance is established.

WHEAT—Sample parcels strengthened under strong holding and a good demand. Local millers confine the bulk of their purchases to Oregon. Futures have been quite active, with slight but attractive fluctuations for scalpers. To-day's sales of futures are reported as follows:

Morning Session: Buyer season—200 tons, \$1.47 1/2; 300, \$1.47 1/2 @ 1/2 c. Afternoon Session: Buyer season—100 tons, \$1.47 1/2; 900, \$1.48 @ 1/2 c.

MANY of the gardens of Sacramento are decorated with Japanese persimmon trees loaded down with fruit. One small tree only two years old bore 35 persimmons this year.

Market Information.

The following are the receipts of the principal items of California produce at San Francisco from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 to Dec. 11, '86.	July 1 to Dec. 10, '87.
Flour, qr. sbs.	2,317,232	1,681,797
Wheat, cts.	8,155,986	4,521,669
Barley, cts.	1,716,778	1,461,617
Oats, cts.	103,579	119,456
Potatoes, sbs.	481,165	557,393
Corn, sbs.	35,886	106,337
Rye, sbs.	14,232	11,382
Buckwheat, sbs.	4,448	742
Beans, sbs.	273,557	311,850
Bran, sbs.	229,544	225,262
Hay, tons.	56,938	64,121
Salt, tons.	12,448	8,780
Wool, bls.	44,293	37,650
Hides, No.	53,480	48,631
Raisins, 20-lb boxes.	97,334	64,327
Quicksilver, flasks.	6,810	12,968
Hops, bls.	12,006	13,356

The receipts of certain articles of produce from Oregon, Washington Territory and other distant points, for the same period, compare as follows:

	July 1 to Dec. 11, '86.	July 1 to Dec. 10, '87.
Flour, sbs.	31,077	95,159
Wheat, cts.	168,542	385,449
Barley, cts.	1,403	75
Oats, cts.	176,945	82,960
Corn, cts.	46,544	12,590
Wool, bales.	9,054	6,986
Bran, sbs.	26,418	20,040
Hops, bales.	648	106
Hides, No.	14,863	13,028
Potatoes, sbs.	25,091	2,247

Cereals.

The wheat exports from San Francisco for November and for the first five months of the current cereal year were as follows:

	For November.	July 1 to Nov. 30.
Great Britain.	548,952	3,997,134
France.	6,693	6,693
Central America.	2,283	2,283
Miscellaneous.	841	3,446

Totals. 556,486 4,009,556
In 1886. 1,946,382 6,591,211

The average value of the shipments each month compares as follows:

	1886.	1887.
July, \$ cts.	\$1 25	\$1 80
August.	1 32	1 79
September.	1 35	1 42
October.	1 35	1 32
November.	1 38	1 35

It must not be forgotten that in clearing wheat cargoes the price is purposely given at less than purchased. This is probably done to deceive farmers.

Beerbohm's of Nov. 25th says that the estimates of the probable supplies for a period of four months (say from the present date to March 25th) are usually vague, and necessarily give only an approximate idea; nevertheless, with India practically out of the field, and the quantity to be expected from the Pacific Coast known almost exactly, it really only remains to estimate the probable supplies from the Atlantic ports and from South Russia, and the likely extent of the English farmers' deliveries. This is attempted in the following table, which is given with a view simply to furnish data upon which to base opinions as to the probable future movements:

Quantity on passage due to arrive March 25, 1888.	1,488,000
Will probably be delivered to the continent	75,000
Probable shipments from Atlantic ports (wheat and flour) from Nov. 19 to March 4 (15 weeks at 125,000 qrs. per week).	1,875,000
Probable supplementary shipments from India up to Feb. 11 at 25,000 qrs. per week.	300,000
Further supplies from South Russia up to, say, Feb. 28.	500,000
Probable imports from Austria-Hungary (wheat and flour).	200,000
Probable imports from Germany (wheat and flour).	175,000
Other countries.	50,000

Total probable supplies of foreign wheat and flour. 4,513,000
Possible English deliveries on the basis of the deliveries in 1885-86. 3,200,000

Total probable supply. 7,713,000
Estimated requirements for consumption for four months from Nov. 25 to March 25, 1888. 8,750,000

Deficiency. 1,037,000

From this it results that stocks, which in first hands at the present moment amount to probably 2,225,000 to 2,500,000 quarters, will have to be drawn upon in the next four months to the extent of over 1,000,000 quarters. With regard to the above estimates, it need only be added that the assumed exports from the Atlantic ports are based on the opinions expressed in the United States that the total exports for Europe during the rest of the season cannot exceed 150,000 quarters per week in wheat and flour. The estimated further supplies from Russia are based on our imports thence in the corresponding period of 1885-86. Austria-Hungary is put down for 20 per cent more than in that last year. English farmers are expected to supply 3,200,000 qrs, or about the same as the year before last, when the crop was estimated at nearly 10,000,000 quarters, while the present year's crop is not believed to have reached that figure.

The above figures, it will be thought, furnish sufficient argument to justify the recent improvement in prices, and are, allowing every possible margin for error of judgment, evidently in favor of a healthy winter's trade in wheat and flour.

The local wheat market has ruled strong throughout the past week.

There have been several sales of desirable parcels of No. 1 white shipping favorably situated at an advance on last week's quotations. Although the daily press quoted \$1.41 1/2 as an extreme, yet it is a well-known fact that good sellers sold at an advance on the above. The stock is well concentrated, while there is said to be quite a short interest on the market, which if forced to fill would send values well up. The engaged tonnage in port receives quick dispatch, which goes to show that the large bulk in store is held by exporters. Millers' wants are chiefly met from Oregon, but lately receipts from that quarter have fallen off.

Barley has held to strong prices throughout the week, under an increased consumptive demand from rail-road builders. Purchases have been made in this market and also in the interior. The receipts at this port are considerably below the consumption. There is also a fair export demand. Brewers are picking up all desirable parcels obtainable at concessions on current quotations.

Oats are stronger under an improved demand and only moderate receipts.

Corn is stiff, with choice grades scarce and wanted. Some parcels have been placed at an advance on quotations. The market at the West is strong, with the bulk of receipts of poor quality.

Rye is scarce and fetches good prices. Choice has sold at an advance with the closing very strong. Buckwheat is without essential change, although some parcels have been placed at an advance.

Feedstuff.

Choice hay is very scarce and wanted. What is now choice was only good in the fore part of the season. The demand continues strong, with a light supply reported. Straw is also in good demand. Carrots meet with a good call at current quotations.

Bran and middlings are offering freely, but as the demand is good, prices keep steady. Ground barley and cracked or feed corn have a stronger tone, with a good consumptive call ruling.

Fruits.

Oregon is sending us, quite freely, several varieties of apples, which meet a good market, as do California, for the better and more choice-conditioned. Defective apples are slow, and placed with some difficulty, except at concessions.

Pears, if choice and in good condition, have ready sales. Poor are slow.

Grapes are in liberal supply for the season, but as usual, at this time of the year, have poor sale.

California limes and lemons move slowly. California oranges come in sparingly, and are hard to quote. It is claimed that receipts will be quite liberal before the end of the month.

Dried fruits are dull, but holders are not pressing the market, owing to light stocks, and it being well known that after January, buyers again enter the market. The stock of canned fruits is not within one-third what it was at this time last year. Raisins are well cleaned up. It is claimed by well-informed parties that not over 15,000 boxes are in the State. The East has drawn more heavily than ever before known. It is thought that before another season, prices will appreciate.

Live-Stock.

Beef continues in liberal offering, and that, too, of good quality. The market is kept down by free offerings from distant points. Calves are wanted and fetch good prices. Mutton sheep are fairly steady. The quality is good, with concessions only obtained from pressed sellers. Acorn-fed hogs come in sparingly. Grain-fed hogs are in fair receipt, with prices well maintained. Packers are taking more than last year. In horses, there is nothing new to add since last week's report.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7 1/2 @ 7 3/4 c; first grade, grass fed, 6 1/2 @ 7 c; second grade, 6 @ 6 1/2 c; third grade, 5 1/2 @ 5 3/4 c.

MUTTON—Ewes, 5 1/2 @ 6 c; wethers, 6 @ 6 1/2 c. LAMB—Spring, 7 @ 8 c.

VEAL—Large, 6 @ 7 c; small, 6 @ 8 c.

PORK—Live hogs, 4 1/2 @ 4 3/4 c for heavy and medium; hard dressed, 6 1/2 @ 7 c per lb; acorn fed, 4 @ 4 1/2 c; dressed, 5 1/2 @ 6 c; soft hogs, live, 3 1/2 @ 4 c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

Potatoes held strong up to Saturday, when upon heavier receipts and only a fair demand prices shaded off. The market closed barely steady. Sweet potatoes move slowly and in buyers' favor.

Onions have a stronger tone for choice good keepers, but soft are easy and in buyers' favor.

Cabbages are strong and in request, chiefly for shipping. The market is stronger than usually obtains at this season of the year.

Root vegetables are steady, with a strong tone reported.

Tomatoes have come in more freely, but the demand is slow.

Miscellaneous.

Flaxseed crop at the West is short, and prices rule strong and higher.

Free shipments of mustard seed are being made abroad, and also to the East. The stock is greatly reduced.

In grass seed there is nothing new to report. Hops have been taken more freely. The bulk received were sold before picked.

Wool is slow, but then the stock is about all cleaned up.

Beans hold very strong, with a slight advance paid for the more choice. Shipments to the East continue to be made.

Poultry has ruled in buyers' favor throughout the week, but closed steadier for the more choice.

Salt is strong, at an advance for imported, but unchanged for domestic.

Domestic coal is \$1 per ton higher, and imported, \$2 per ton higher—just equal to the duty.

Deerskins are advancing, but beef hides are weak and low.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.	332,227	203,494
In port, disengaged.	93,280	63,390
In port, engaged.	21,250	63,700

Totals. 446,757 330,590

To obtain the carrying capacity add 60 per cent to the registered tonnage.

San Francisco, Dec. 14, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

Pulverize the Soil.

Summer-fallows receive one or two plowings only during the summer. The surface hardens into a crust and becomes a mass of clods when plowed, and weeds are allowed to grow and seed the land. The time required for repeated plowings prevents the necessary work. But with the "Acme" Pulverizing Harrow, Clod-Crusher and Leveler, work even better than plowing may be performed in one-fifth of the time, the weed sliced up and killed and the operation repeated so often that the field will be a clean mellow bed by autumn.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Consumption Surely Cured.

To the Editor:—Please inform your readers that I have a positive remedy for the above named disease. By its timely use, thousands of hopeless cases have been permanently cured. I shall be glad to send two bottles of my remedy FREE to any of your readers who have consumption, if they will send me their Express and P. O. address. Respectfully,
T. A. SLOCUM, M. C., 181 Pearl St., New York.

I CURE FITS!

When I say cure I do not mean merely to stop them for a time and then have them return again. I mean a radical cure. I have made the disease of FITS, EPILEPSY or FALLING SICKNESS a life-long study. I warrant my remedy to cure the worst cases. Because others have failed is no reason for not now receiving a cure. Send at once for a treatise and a Free Bottle of my infallible remedy. Give Express and Post Office.

BARREN HILL NURSERIES

NEVADA CITY, CAL.

SPECIALTIES:

NUTS, PRUNES AND GRAPES.

The Finest Collection of "Nut-Bearing" Trees to be Found in the United States.

21 Varieties of Walnuts,

INCLUDING

CLUSTER WALNUT (Juglans Racemosa).

The newest, most prolific and valuable variety ever introduced into this country.

PRÆPARTURIENS,

Or FERTILE WALNUT, introduced into California in 1871 by Felix Gillet.

"Second" Generation Præparturiens,
 (California grown).

"Second Generation" trees, grown from nuts borne on the original tree; 80 to 90 per cent guaranteed to be "pure," or having retained the characteristics of the original Præparturiens, chief among them the surprising fertility of that type.

Third Generation Præparturiens or common French walnut (Juglans Regia), grown from nuts borne on Second Generation trees, all California grown. Vigorous and fertile variety, but the nuts smaller than those of the second generation.

GRAFTED WALNUTS.

Franquette Parisienne, Mayette, Chaberte, Meylan, Vourey and "Weeping" Walnuts, the leading varieties of Europe, highly recommended for the size, beauty and quality of the nuts, fertility, and above all, "hardiness" of the kinds.

We offer this season imported trees of the seven above sorts, expressly grafted for us, regardless of cost. The difficulty in grafting the walnut is such, and grafted walnuts are originally so scarce, that we are compelled to decline orders for such trees in quantities over a dozen. Only a limited number of trees of each kind from four to six feet.

"MARRONS." or French Chestnuts.

(Solely propagated from grafting.)

MARRON COMBALE (California grown).

10 Varieties of the finest kinds of Marron-Chestnuts to be found anywhere; at the head of the list "Marron Combaie," which we have been fruiting upon our place the last 13 years; very large and sweet nut, prolific; one of the very best for market.

7 Varieties of Filberts.

4 Varieties of Almonds.

4 Varieties of April Cherries, the earliest and most prolific in California.

245 Varieties of Grapes, from all parts of the world, including the earliest Table Varieties known, some of them 25 days earlier than Sweet Water.

61 Varieties of English Gooseberries, all shapes and colors, some large as walnuts; all "true to name."

CORK OAK, 2-year-old Trees, from Spain.

Prunes! Prunes!

Lot D'Ente, or D'Ente "true from the root," one of the best and finest types of the "French Prune" and the kind so extensively cultivated in the prune district of France. This type is not propagated from grafting, which would do away with its chief qualities of being more vigorous, more long-lived than grafted trees, and a "gum-resistant" stock.

Also, the finest grafted types from the home of the Prune D'Ente or D'Agen, on Myrobalan, St. Julien and Almond stock.

Saint Catherine (true from the root), one of the finest dessert Prunes, and one of the best for preserving and drying.

Pyramidal D'Ente, Blue and Red Perdigon, German and Italian Quetsche, Alsace Quetsche, Knight's Green Drying, etc.

Apricots, Peaches, Pears.

Quinces, Plums, Mulberries.

Figs, Fancy Fruits, Etc.

FRENCH, ENGLISH, GERMAN AND AMERICAN STRAWBERRIES.

Send for General Descriptive Catalogue, illustrated with forty-one cuts, representing Walnuts, Chestnuts, Filberts, Prunes, Medlar and Sorbus.

HARDWARE AND AGRICULTURAL IMPLEMENTS.

GEM SEED SOWERS.

No. 1, Weight, 130 lbs. \$20.

This Machine is run with a Chain and Bevel Gear. It is the one we have sold for years, and has given the best satisfaction of any broadcast seeder yet invented.

No. 2, Weight, 154 lbs. \$22.50.

Runs with Chain and Belt Gear. The advantages gained on the bevel gear are smoothness of movement, noiseless while running, durability of the fast running parts, and the evenness with which it sows the grain.

No. 3, Weight, 164 lbs. \$25.

Runs with all Gears. This machine is preferred by many to the others which run by Chain. The feed valves and distributor are the same as in the others.

We have manufactured the GEM SEEDERS for a number of years, and they have given better satisfaction than any other Broadcast Seeder in the market. They throw the seed horizontally instead of vertically (as in all old-style Seeders), and thus save a large portion of the grain. Where sold they have never failed to give satisfaction. ARMSTRONG'S PATENT FORCE FEED is attached again this year, and is considered by those who have used it, a great improvement.

THE GENUINE GEM SEEDERS are manufactured exclusively for us at Benicia. SEE THAT OUR NAME IS ON THEM.

Forestry.

The State Board of Forestry is proceeding with its work vigorously. In addition to the efforts to preserve the existing forests by prevention of illegal cutting, careless firing, etc., by posting everywhere notices that all trespassing will be prosecuted, and by appointing guardians to see that these notices are observed, we are glad to see that the work in formation of new forest plantings is going forward. The establishment of forest stations for the propagation of promising trees in considerable quantities, and for testing all trees, native and foreign, to determine their adaptations, is certainly a wise movement on the part of the Forest Board. In this work they are securing co-operation from public-spirited and generous citizens, and the prospect is that a vast work will be accomplished at a comparatively slight expenditure of public money. We have already mentioned the contribution of desirable land at Santa Monica for a forest station, and we just have a note from Mr. Abbot Kinney, Chairman of the Board, to the effect that Hon. John Bidwell will set apart 50 acres of Rancho Chico for the uses of the Board. This is an excellent act on the part of Gen. Bidwell; and quite consonant with his other manifestations of public spirit.

The board intends to proceed actively with practical work at its stations. As forest officer to establish the nurseries and plantations at the Santa Monica station the board has elected Mr. H. Rowland Lee, whom we believe to be well qualified for this work. He was trained by study and practical work in tending nurseries and private establishments in Great Britain and then took a course in the Royal Gardens at Kew under Sir Joseph Hooker, and obtained certificates of proficiency in the scientific branches of his profession. Coming to America he continued his training by practical work in one of the leading gardens of Toronto, Canada, always pursuing horticulture both as a science and an art. Before coming to California he spent some time in the Southern States in similar work and studies. During the last few months he has been employed in the experimental gardens of the State University at Berkeley, where he has given full satisfaction. Under the instructions of the board Mr. Lee will make collection of seeds and plants available in this part of the state and then proceed to Santa Monica so as to get full benefit of the growing season. With

reference to the work at the Chico station we shall have better information hereafter.

COLORED COLONISTS.—A colony of colored men recently settled in Shingletown, Shasta

CEREAL VALUES.—The December report of the Department of Agriculture relates mainly to farm prices of agricultural products. The average value of corn is 43.8 cents per bushel, against 36.6 last year and 32.8 in 1885. In 1881

The Religious Ideal.

The embodiment of the religious ideal has been the longing desire of the human heart in all ages. The conviction of spiritual existence has been so irresistible and so thoroughly possessed the imagination, that the whole material universe has been peopled with gods and goddesses who lived in the woods, fountains, rocks, ocean, air and among the stars. To personify the Deity was the highest aim of classic art. But with all its beauty, a shadow hung over it. There was a sadness in their joy—a sense of something wanting. The story of Pygmalion was the common dream of men. They felt after a divine life, longed for it with a certainty of its reality which their unaided senses seemed incapable of grasping. That conviction silently shaped itself into an unconscious prophecy. The loftiest music and poetry raised its voice to it. At length, in the fullness of time, what the hearts of all nations had longed for was announced by the angels singing, "Glory to God in the highest, on earth peace, goodwill toward men." The Life was manifested; that Life was the light of men, and the heart of humanity has been satisfied.

To portray some shape of that life has been the supreme effort of Christian art. The manger, the baptism, the transfiguration, the cross, the crown and many other things have been the joy and inspiration of the painter and sculptor. It was not till the fifth century that art attempted a representation of the Mother of Christ. A chronological arrangement of the pictures of the Virgin would exhibit in a remarkable manner the growth of the Roman Catholic idea. The Virgin has been the principal theme of the great masters, but the grandest success was attained by Raphael. His madonnas are very numerous, and represent the Virgin in various ways—now as the ideal of female beauty, now as a loving mother with a pretty babe, and now as the Queen of Heaven. Among the symbolical representations may be mentioned, Mary with the white mantle of love under which she receives the faithful, with a half-moon or globe under her feet, and now sitting on a cloud

holding the child in her arms. The picture on this page adheres closely to the realism of modern art, and represents a young mother in the sweet consciousness of her first born.

GLADSTONE will spend the holidays at Milan

THE MADONNA OF THE ROSE.

county. They have already secured land, and will follow farming; but part of them are co-operators and will work the fine cedar of that locality into various utensils. They seem to be intelligent, and most of them belong to the Baptist church.

it was 63.8, during which year the estimated product was 1,194,916,000 bushels. The average value of wheat is 69 cents, being three mills higher than the average for last year, and for oats 30.7 against 29.8 last year. The barley average is 52.2 against 53 last year.

Horticulture.

EDITORS PRESS:—During the past few years horticulture has been gradually pushing its way to the front of all of California's great industries, and, with the impetus given to it by the past season's success, it may soon claim to be the greatest of our industries. There have been years of experiment, and some of them discouraging years, and yet all of them advancing this interest until something like a definite impression has been gained as to the future reliability of fruit-growing as a legitimate and profitable enterprise, and, moreover, a stability gained which shall remain unshaken hereafter. Many years of observation have given me the firm conviction that upon horticulture will California's greatness in the future most largely depend. Upon this pursuit in some of its farms have most of those who have looked with long eyes toward California been building their hopes, and to those who have already entered upon this pursuit the love of it has overriden all discouraging features and has strengthened the will to overcome every difficulty and achieve success. Many have failed from various causes, some of which will hereafter be pointed out, to achieve the success so fondly anticipated, while many have gained all the success they have deserved. Many difficulties have stood in the way and have been one by one overcome by the persistence of the pioneers in this work, until now it is quite possible for the industrious and capable person to enter upon this pursuit with a reasonable assurance of freedom from serious mistakes, and an also reasonable certainty of financial success.

The choice of location in which to embark upon a horticultural enterprise has been up to a recent date a factor of uncertainty. Gradually the adaptability of certain localities to the perfect maturity of certain desired fruits is being ascertained, and the very serious questions of years ago in this respect have to a great degree become settled. The great variety of fruits which may be profitably grown in the right localities is only an evidence of the stability and profit of fruit-growing when rightly undertaken. The factors entering upon the choice of location should be carefully weighed before starting. Haphazard work should not have a place now. Facts should be sought and the lessons taught should be acted upon with a steady persistence which knows no failure. There is no business where a greater amount of "stick to it" is required than in this. A tree does not grow in a year to fruitfulness. Patience must have its perfect work. Yet in no country in the world is such early fruitfulness and profit from trees known as here. In fact, I believe that one of the great hindrances to a more rapid settlement of our State by Eastern agriculturists has been the greatness of our facts, which have been received as fairy tales rather than sober truth. The day of prosperity for our State has fairly dawned, however, and the East is fast finding out our advantages.

Being familiar with most of the fruit-growing localities of the State, their respective products and advantages, I feel I cannot do a better service to the many who intend to follow horticulture than to call attention to the

Santa Ynez Valley

As a most desirable field for their efforts. As familiar as I have been for years with the fruit-growing enterprises of the State, I was surprised to note upon my recent investigations of this valley the great advantages it possesses for horticulture upon a large or small scale, and this surprise was intensified that such a region should be so comparatively overlooked. Now, however, that the large ranches are being subdivided, this region will take a decided position in fruit-growing, and not many years hence will become one of the prominent sources of supply of many of our best fruits. The peculiarly favorable aspects of latitude, climate and protection heretofore alluded to will tell immensely in the future for successful horticulture in this valley.

The Olive.

One of its most noted products will undoubtedly be that of olive oil; and this valley possesses the factors which will make it markedly prominent in this production. I believe that the essentials of a good olive are a suitably even temperature, impregnated to some extent by the sea-air, and yet in order to make the enterprise successful, freedom from the pests which beset the olive directly on the sea-coast.

Although some, like Mr. Ellwood Cooper, have the courage to battle with the black scale, and like him, to succeed in spite of such obstacles, yet it is far easier to take advantage of nature's beneficent acts in behalf of man, and plant the olive where evidently nature designed it should have a home and thrive. Now, here, of all other places in California, has nature provided all these requisites for the olive. There is hardly a portion of all this great valley with its surrounding foothills where the olive has not a congenial soil, and certainly not a spot where it has not a congenial climate.

The tree will grow vigorously, receiving ample moisture from rich, well-drained soil, in all portions of this valley. The black scale does not thrive on the olive here, and the trees possess a vigor and a remarkable brightness and cleanliness of wood that is a guarantee of health and fruitfulness. It is far enough away from the sea-coast, while getting the sea air, to give the proper atmospheric nourishment to the olive, and yet kill out the black scale by climate alone. This fact is becoming so evident that many thousands of olive trees have already been planted here by single individuals. The largest planting of olives in the State is already to be found here, and this will be in the future the most prominent olive-growing district in the United States. It will be hard to estimate the value of these lands in the near future for olive-growing. The variety now solely grown is the so-called Mission olive, and which has so far proved the most successful for oil and pickling. Other varieties, after some years of experimenting, may be found to equal this, and possibly some can be found superior, but at this date there is no other variety that will be safe to plant in quantity.

The trees are grown from the cutting. Probably the best method of growing the cuttings is to take from the new growth of wood that which is not too large, and in short lengths of about 10 or 12 inches, and starting under a frame in hot-bed, so as to secure a good rooting, and then transplanting in nursery for a few months until the season for planting out in orchard arrives, when these nursery trees at one year of age are to be placed permanently. The distance, perhaps, most suitable in ordinary planting is 24 feet square. Some plant 30 feet apart in septuple form, and Mr. Cooper advises 20 feet square. Most olive trees are grown so as to allow a trunk of five or six feet before any branching is allowed, and, in many parts of Europe, according to Prof. Dwinelle, who has recently been making observations there, the preferred method is to grow in bush form, when the fruit can be easily gathered by hand without bruising. The care necessary in picking, treating, crushing, and expressing, is well repaid in the profits from a first quality of oil. For fuller information in regard to olive culture the treatise of Ellwood Cooper, Esq., published in 1882, and various essays by the same gentleman on the olive and published in the reports of the State Board of Horticulture, may be referred to.—[Another important contribution from Mr. Cooper will soon appear in the RURAL.—EDS. PRESS.]

No fruit tree can be grown that is longer lived than the olive. Trees may be seen at the various Missions now as old as the Missions themselves, and the trees in vigorous health, while the ruins around them testify to the utter neglect shown everything.

The profits of olive-growing are in many cases very large. The trees as yet planted in the Santa Ynez valley are young, but with the greatest promise. The limits of this article will not permit entering into the particulars of olive-growing and the preparation of the oil. This will no doubt become the leading industry of this valley in time.

Already have some 25,000 olive trees been planted, and these are growing most thriftily. Of these Mr. Selby has 5000, Mr. W. A. Hayne with Mr. Gould 5000, Mr. Ben Hayne about the same number, and the Messrs. Boyd as many more. These gentlemen intend largely increasing their respective plantings. Mr. Henry D'Urban also intends planting a large area for himself and English friends, probably amounting to a section of land.

The Grape.

While the olive may take the prominent position, yet the grape will probably share the warm meads with it. The greatest success with the grape has been met by Mr. Louis Janin, who has thoroughly tested the value of these lands for grape culture. Not only will these succeed for wine purposes, but the Muscat grape for raisins attains perfection in this genial climate. It will be remembered that one of the most prominent raisin-growing regions of the State, the Orange and Santa Ana district, is in nearer proximity to the sea than the main Santa Ynez valley.

The lower and more level valley lands will, no doubt, be monopolized by the

Deciduous Fruits.

Some of these valleys as plain lands along the river are so rich that these fruits reach the greatest productive capacity, the greatest size, and the perfection of quality. This is the southernmost portion of the State where some of these fruits can be grown profitably. I may instance the cherry and the almond. I witnessed in the orchards of Mr. L. Janin and that of the De La Cuesta family the greatest success in orchard-growing. There is no place in the State where finer trees of equal age can be found, and nowhere that I know of, except in this valley, can orchard districts be found without some of the pests which infest fruit trees. I will say that here, as yet, there are none of these pests. I carefully examined the apple and pear trees heavily laden with fruit, and there were no codlin moth larvae (worms in the fruit). The same careful examination showed that there were no scale insects of any species, and a critical search of the almond trees showed that no red spider existed here. These facts are remarkable, and I cannot too strongly urge upon fruit-growers in this valley to guard their advantages with most scrupulous care,

and under no circumstances allow infested trees or fruit to be brought into the valley at all. I can only reiterate what I, in an official way, often advised, that no chance should be given insect pests to gain a foothold in localities that were free from them. Only the most rigid quarantine measures can successfully resist their invasion, and the example of Riverside consistently followed out four years, and that recent emphatic bundling out of the town of Pomona of a carload of pest-laden trees with their owner, may be commended for future use. In no more important case than this will the force of the old adage, "an ounce of prevention is worth a pound of cure," be felt.

I would like to see the ideal fruit-growers' paradise here established where perfect union of purpose and action shall impel all to keep free from pests a locality nature has so blessed. If this be done, the welcome dollars will respond to the call of the industrious horticulturist and many of them jingle in his pocket instead of being sunk in the whale-oil soap barrel. I may also allude to the great scarcity of *hare* (jack rabbits) in this valley, which in many localities necessitates the expensive construction of rabbit-proof fences. This expense can be avoided here altogether. I was particularly impressed with the freshness and cleanliness of the bark of the fruit trees here. This indicates perfect health, and where such vigor is present abundant fruitfulness may naturally be expected.

Among the best of the apples here succeeding finely, I noted the Yellow Newtown Pippin, which is the choice coast apple of the San Francisco market. This tree here is a heavy bearer and the fruit perfect in every way. Among the pears the Winter Nelis is remarkable for its profuse bearing. This and the Ester Beurre are favorites for winter pears, while the Bartlett is the chief summer pear. A particularly fine and valuable shipping pear to grow here would be the Fox Seedling cull named "P. Barry," which is to be eaten in January.

The apricot tree here grows with the greatest vigor and fruits heavily; the varieties best suited to this locality are the Moorpark and the Royal. The Moorpark is the finest apricot, however considered, in every respect, but its peculiar habits of fruiting render it necessary to plant in the proper localities to become a source of profit. No other apricot possesses the flavor and richness of the Moorpark when canned, and no other equals it in size. These coast valleys are the natural home of the Moorpark. The profits from this variety this season along the coast have been immense where canneries have been accessible, and in drying where that method has been preferred. The apricot is not subject to scale pests, and is a safe fruit to plant anywhere it will succeed.

The peaches grown in the Santa Ynez valley are of the very finest quality, reaching immense size and possessing the highest flavor. This fruit is always in demand, bringing high prices, and the supply has never yet reached the limit of consumption. With all fruits the grower should be on his guard against planting too many varieties if he wishes to succeed in marketing satisfactorily. A few varieties of the choice peaches should be selected from, and the intention should be to grow for canning chiefly. The Early Crawford and the Foster best fulfill this object for yellow freestones, and the Heath Cling for a white, and the Lemon Cling for a yellow among the old varieties. There are, however, some new varieties, which are even preferable—more particularly of these I would name the Sellers Cling, a large, high-flavored, yellow peach, free from red at the pit and putting up beautifully, and as a companion to this the Tuscan Cling of the same color and freedom from redness at pit. The White Cling of peculiar value is the McKevitt—pure white to the pit and of the choicest flavor. For drying purposes, as well as canning, the Muir (yellow freestone) is a favorite; but succeeding better yet near the coast is a peach called the Loomis Seedling, grown by Mr. Loomis of Patchen, Santa Cruz mountains. This peach gives the highest percentage, free from waste, of dried fruit of any peach known. All these I have personally tested and grown excepting the Tuscan Cling, and know their suitability to the coast valleys.

The luxuriant growth of trees here is illustrated by the extraordinary growth of from 12 to 15 feet of new peach wood which I noticed in the De La Cuesta orchard.

The French prune is a decided success here in this valley, and when we consider the enormous consumption of this prune in the United States, and the further fact that even then only a portion of the people have ever tasted this dried fruit, we are safe in saying that one of the chief industries of the Santa Ynez valley will be prune-growing. The moist, well-drained and exceedingly rich and mellow plain lands of the river valley are especially suited to the production of the prune. There is no fruit product so easily prepared for market as this. Shaken off the tree (not picked), dipped in water to cleanse from dust, dipped in lye and then spread out to dry, taken up at the proper time, packed in boxes and stored away ready for market, it is a product as good as gold to the owner. A few acres of this fruit in the right locality will support a fair family of not too extravagant habits, and in the care and management of this crop every member of the family may engage. The one variety to plant is the so-called French prune. Among the plums I noted the Yellow Egg, which is the choicest of canning plums.

The cherry cannot be grown with profit in

the southern portion of the State, and the limit of production may be set at the Santa Ynez range of mountains. This valley is the southernmost region where success may be attained. The varieties that should be chosen are the Black Tartarian for a market table-cherry, and the Napoleon Bigarreau, Centennial and Black Bigarreau (or Gros de Mezel) for canning and table. The black cherries are free from the attacks of scale insects. The Napoleon Bigarreau (or Royal Ann) is the white cherry particularly valuable for canning. The small fruits, blackberries, raspberries and strawberries, will find the best of soil adapted to their growth along the river-bottom lands. There can be had lands as moist as may be desired for that purpose.

The nut succeeding here is the almond. The English walnut is somewhat doubtful as yet. The almond, as is well known, has been almost a universal failure in Southern California, and like the cherry its limit is the Santa Ynez range. As fine almond trees as can be seen in the State are grown in the De La Cuesta orchard, vigorous, healthy and fruitful, and free from the pest universal over the State—the red spider.

The coast valley portions of San Luis Obispo and the northern portion of Santa Barbara county have long produced the finest almonds, and this nut will become one of the prominent products of the Santa Ynez valley. It will not be advisable to plant the Languedoc variety so called, for it has, as a rule in most of the regions where it is grown, proved a poor producing tree and the hulls are very difficult to remove, especially if once wet by rains. These need also to be sulphured to fit them for commerce. Without question the best almond to plant are seedlings that succeed well where originated and some that have become of world-wide reputation. The prominent ones of these varieties are the Hatch seedlings, originated by A. T. Hatch, Esq., of Suisun. These seedlings are heavy bearers of the finest-flavored nuts, and do not require sulphuring for market and are, moreover, easily hulled. These requisites are not overlooked by those who have had experience in almond-growing. These fruits with the almond I have considered more fully by reason of the probability of their forming the chief horticultural products of this valley.

I have no need to dwell upon the importance of the remarkable freedom from insect pests observable in this valley—we should be thankful that such a locality exists—and I need not dwell upon the agricultural products of this region; suffice it to say that no finer milling wheat is grown than that produced here, and it has induced Mr. Steele and his associates to decide upon the erection at an early day of one of the largest flouring establishments on this coast, to be situated in the center of the valley, and to cost fully \$100,000. The more particularly vegetable products of the valley lands are illustrated by the enormous growth of potatoes, 100 sacks to the acre, which I saw being turned out of the ground on the Llano Grande. Also from the same ground enormous quantities of beans and English mustard seed at the rate of one ton to the acre.

I saw here on the Llano Grande a natural stand of wild-oat hay, so dense as to make it difficult to force a way through, and where cut and cured, it gave a yield of hay of over three tons to the acre.

On this mellow alluvial soil anything and everything can be grown in luxuriance and profusion. Water in inexhaustible quantities and of the purest quality is found at a depth of 15 to 20 feet from the surface.

This valley will rapidly develop the largest fruit industries, and will, in the near future, become one of the most noted for health, and one of the most prosperous communities of the State.

S. F. CHAPIN, M. D.

Auburn, Dec. 15, 1887.

Sierra Valley Notes.

EDITORS PRESS:—Winter seems to be trying to take this mountain valley within its icy grip. The mercury has been down to zero, while in Clover valley, on the road between Sierra and Indian valleys, it has marked 8° below zero.

We have had several days of hard winds which sent the accumulation of months of dust in great gray suffocating clouds along the stage-road, and other less frequented highways. Such winds from the southwest we usually consider sure harbingers of a storm, but as yet we have had only two or three slight siftings of snow, and the ground is too dry for fall plowing, which in this region seems something of a necessity, as the winter often lasts well into the spring, leaving the farmer but a short time to get his crop in before the growing summer weather.

When last heard from, the work on the Nevada & California railroad was being pushed forward down Long valley. Work on the Sierra & Mohawk railroad was suspended about 11 months ago, and was resumed only for eight or ten days in July, since which time much property belonging to the road has been sold off at sheriff's sale. It seems that some moneyed company should find this railroad a profitable investment, for there lies in this part of the Sierra Nevada a large tract of country rich in agricultural and mining resources, as well as much valuable timber.

Artesian well-boring is still going on in this valley. E. Healey has just taken his large machine into winter quarters, having closed his

season's work by boring the largest well in the valley on the desert land entry of D. M. Glosster. I do not know the capacity of this well, but the water fills a four-inch pipe, three or four feet above the ground, and is thrown with much force.

Thanksgiving has passed with the usual festivities; and the oncoming holidays have made further demand for the fat turkeys of our poultry-yards. Eggs, too, have gone up to 50 cents per dozen, a price which, though unsatisfactory to the purchaser, is well pleasing to the farm-wife depending on their sales for her pin-money. M. P. A.

Beckwith, Dec. 13, 1887.

Ventura.

EDITORS PRESS:—Why is it that this county is seldom referred to in your columns? Is it because you have so few subscribers here? Is it because your subscribers have too much else to do with practical husbandry, or is it that the plow is heavier than the pen and unites one to handle the smaller point of steel? Certainly your columns should have glowing words from this "right little tight little" county. Little? Yes; but of greater agricultural and horticultural importance than others of far greater area. Small and young, yet the exports of farm products from this county for the last 10 years exceed in value \$10,000,000, and yet out of a possible 700,000 acres susceptible of cultivation less than 200,000 have ever felt the "harrowing work" of the farmer. The yield of grains, fruits and nuts is marvelous, and when it is considered that but little or no irrigation is required, that the climate rivals far-famed Santa Barbara, and, we claim, excels Los Angeles, the wonder is why there are so few intelligent farmers and fruit-growers here located. Not that I would intimate that our agriculturists were non-intelligent, but simply there are so few of any class. Our broad acres, with silky soil, lavish water supply and genial temperature, are capable of supporting a hundred families where now one "tickles the soil to find it laugh with harvests."

We need intelligent farmers, men who cultivate the soil with brain as well as brawn, and if they be not found among your readers, where can they be found? And it is only necessary to state facts to engage the attention of your readers.

Barley here will average a larger crop than in any other county in the State.

Lima beans will run from 1250 to 1750 pounds per acre, other beans will produce equally good results, and other farm products will not fall far behind.

Quite a number of our fruit-growers have obtained from \$150 to \$200 per acre from apples, pears and orchard fruit.

From English walnuts the grove-owner has netted from \$150 to \$250 per acre.

Everywhere are signs of evident prosperity. In the county-seat substantial improvements are the order of the day, and yet we have no "boom." We, in Ventura, are too busy raising crops to spend much time in raising prices.

Ventura county is worthy of your notice, and in the future the RURAL PRESS will acknowledge the error of its way, if in the nearer future it does not pay heed to this fair county of the Southland.

There are some—I will swear to at least one—that welcome the RURAL PRESS that comes weekly, but strongly, to help the tillers of the soil, and I am glad to acknowledge the debt I owe to the brains of my weekly visitor.

San Buenaventura. W. G. WILDE.

[Ventura county is not more heard of because our readers (and we have many of them) do not take the interest in showing forth the faith that is in them that the dwellers in other counties do. But we have not been altogether remiss ourselves. Our special correspondent, "McD," gave us several carefully prepared letters, and we have had others. The burden is, however, a local one. Our readers must claim the privilege which we offer to all, to write us freely and still truthfully and accurately of all local agricultural progress, and how it is attained.—EDS. PRESS.]

THE ORNITHOLOGIST.

The Fate of the English Sparrow.

Our readers will remember our allusions to the branch of the Department of Agriculture styled "Economic Ornithology," which was established some two years ago, and by a law passed in July, 1886, was set at work upon the investigation of the food, habits, distribution and migration of North American birds and mammals, with special reference to agriculture, horticulture and forestry. The scientist in charge is C. Hart Merriam.

A publication has just been issued which gives the result of a careful inquiry into the history and deeds of the English sparrow in this country, of which we give the following outline as prepared by an Eastern exchange:

In 1850, a year when the "measuring worm" was most wantonly active in New York and Brooklyn, crowding the trees of parks and streets, some philanthropic citizens of Brooklyn imported eight pairs of English sparrows. They were carefully housed in winter and let loose in the spring. In 1852 another importation was

made. From these sprang unnumbered woes. A few square feet then bounded their ambitious flight. Now, after a lapse of 35 years, they range over 1,000,000,000 square miles of the United States and Canada. They "spread themselves" slowly at first, but soon set out to undertake the conquest of a continent. They now occupy all the States from Maine to the Mississippi, and possess Kansas and Missouri. They are found in detached settlements along the Gulf and in Texas, and will soon cover all the area in which are their outposts and colonies. At Salt Lake City they overrun an elliptical region as large as Vermont and form a cordon around the Golden Gate. For the last 15 years they have spread at the rate of 60,000 square miles a year. They adopt all routes and means of travel. They entered the Eastern provinces and Canada by free rides on boats and cars, and made themselves a home at once. The undaunted bird is a free commoner, and wherever he goes he settles himself down with alacrity and furnishes teeming colonies for fresh fields. If accident bears him a thousand miles from his accustomed habitat, he is at once the active agent of new diffusion.

The statistician of the ornithological division furnishes some appalling figures anent the increment of these birds. They fairly beggar the results of geometrical progression and eclipse all common arithmetical calculations. We can only summarize his statements, and submit them to the credulity of our readers. A pair of sparrows produces five or six broods in a year with four to six young in a brood. Assume the product to be 24, half males and half females—with the old birds, 13 pairs in all. These 13 the next year produce 312 birds; add the 13 pairs and you have 338. Go on with this calculation for 10 years, assuming that all live out that period, and the result is thus given, sanctioned by the Executive, published by Congress and distributed to a long-suffering people:

End of 10th year—Number of pairs of young, 127,253,992,476; number of pairs breeding, 10,604,499,373; total of pairs, 137,858,491,849; number of birds (total), 275,716,983,698.

Now we know, officially, how many English sparrows there are or might be; the next thing is to determine in what manner they are to be disposed of. "Uncle Sam" has fought and overcome enemies worse than sparrows. He is not to be intimidated by these petty birds, even though they come in billions of flocks.

By circulars sent to all parts of the country the Government invited information as to the habits of the sparrow. The statements returned are made the basis of an indictment of which the following are the leading points: The English sparrow has expelled native songsters, which are unable to maintain their ground against his determined belligerency. Among the familiar birds once visiting our gardens and fields, but now less frequently seen, are robins, bluebirds, song sparrows, wrens, yellow-birds, orioles and others. These have been frightened away, often killed and their eggs and young destroyed and even eaten by these feathery cannibals. Gardens, fields and fruit trees suffer in the absence of insect-eating birds, and the sparrow eats birds, fruit, berries, grapes, peas, beans, grains, etc., and allows insects to prey at will upon them. If he ever had a relish for insects he has lost it and feeds instead upon the products he was expected to protect. He has not lived up to the contract under which his labor was imported. He defaces buildings. The trees in which he lives are often alive with caterpillars, who even spin their webs in the very homes of their supposed enemy. A street in Albany is especially pointed out as alive with sparrows, while elms and horse-chestnuts were stripped of their foliage by the tolerated insects. The sparrow and the caterpillar are in a "combine" against arboreal insects. These statements are established by the testimony of hundreds of careful observers, by expert entomologists and by conditions obvious to any one who will pay attention to the situation. To be sure the sparrow and the songbirds are often seen in association upon the same grounds, but the association is not friendly, as the cautious movements of robins and wrens indicate. They always keep an eye at least upon their foe and avoid his approach like a pestilence. The New York State Entomologist, Prof. Lintner, advises "a relentless war" upon these sparrows. Mr. Gurney, an English entomologist, says sparrows, in their best estate, do one-fifth of good to four-fifths of harm, and in many instances "they do nothing but harm." In England the damage caused by sparrows directly is put at several million dollars annually. The sparrow, true to the characteristics of his life, is in his death a delusion and a snare. His remains are sold in the markets under the posthumous title of "reed-bird," and some dealers report their sales by thousands every month. The sparrow is indeed an excellent article of food. There is no reason why he should not be toothsome. He is nurtured on the most approved diet, and he has ample time to wax fat and juicy.

The English sparrow is already under the ban of law. In New York State an Act passed last winter makes it a misdemeanor to feed or protect him. His destruction is legalized, and the way is clear to a general war of extermination. He is a wary bird and is "up to trap." He scents afar off the appliances that would disturb his peace. The Department of Agriculture suggests various expedients for disposing of this bird, his nests, eggs and young. They are to be attacked by day and by night. Their colonies may be easily destroyed by the

free use of water or by tearing them down with rakes. They may be fed in some convenient spot for a few days, at a regular hour, and then, when they are massed together, they can be killed with small shot. Nets may be spread for them or grain may be watered in a solution of nux vomica or arsenic and disposed in their feeding-places. These seem to be cruel methods, but a sparrow's life is no dearer to him than that of a rat or fly or a mosquito is to one of these interesting torments, whose destruction is undertaken as a matter of course. The safety of the people is the supreme law, and if the sparrow is the enemy of the gardener and the farmer, if he is to be classed with vermin, he must meet the doom of his pestilent class.

THE FIELD.

A Beet Sugarie Established at Watsonville.

According to the *Pajaronian* of last week, the first evaporator of the Western Beet-Sugar Co. is to be located in Watsonville. It is stated that at a meeting recently held the directors of the beet-sugar company met a number of committees from towns desiring sugar factories and tendering valuable sites and other considerations to secure the first evaporator. Dr. Ford offered on behalf of the citizens of Watsonville and Pajaro valley a site for an evaporator, and Mr. Spreckels then informed the other visiting committees that Watsonville had been selected as the place for the first evaporator, and that in time he would visit the localities represented and consider their advantages as locations for evaporators to be erected in following seasons.

The *Pajaronian* gives the following outline of the local aspects of the enterprise: Claus Spreckels and C. A. Spreckels have been in town since yesterday noon, for the purpose of signing contracts with the farmers to cultivate sugar beets next season. The contracts vary materially from those in use at the Alvarado factory, and are far more in the interest of the producer. Summarized, the farmer agrees to plant a number of acres in sugar beets in 1888, the seed to be furnished by the Western Beet Sugar Co.; he is to prepare the soil at the proper time, and is to carefully cultivate, thin out, and harvest the beets; to deliver the beets clean and in good condition, with the tops closely cut off, at the factory at Watsonville; and the amount to be delivered, to be increased or diminished as the requirements of the factory may direct. Beets weighing over three pounds, or those grown mostly above ground, or defective, and unfit to be manufactured into sugar, will not be received unless said beets contain at least 13 per cent of sugar, according to polariscope test. In the event of any earth being left upon said beets, the weight thereof shall be deducted from the total weight of said beets. The pulp is to be divided equally between the farmers' and the factory and the refuse lime is to be divided pro rata between the farmers growing the beets. The sugar-beet company agrees to pay \$4 per ton for all beets cultivated and delivered in accordance with the terms of the agreement, on the first day of each month after the beets are delivered, and it further agrees to pay a further sum of 50 cents per ton for each degree in polarization over and above 14 per cent; provided, however, that the coefficient purity of the same is not less than 84 per cent. It also offers a bonus of \$500 to the farmer, cultivating from 10 acres upward, who will raise the best crop of sugar beets in 1888—that is, showing the highest percentage of saccharine, and \$250 to farmer, cultivating from 5 to 10 acres, whose beets show, in that class, the greatest percentage of saccharine matter. This is an incentive to careful cultivation.

Contracts for nearly 1200 acres were signed yesterday, and it is probable that the balance of the required acreage will be obtained to-day. Mr. Spreckels will put in 250 acres on his Aptos ranch, but will not compete for the premiums offered. They are offered for the farmers of this valley.

Mr. Spreckels and son were accompanied by their draughtsman, Mr. Waters, and they jointly examined the site yesterday, with reference to the location of buildings. The company proposes to begin the work of grading as soon as possible, to be followed by the laying of foundations so as to have everything in readiness for the erection of buildings and the placing of machinery as soon as possible. The site comprises the John Wintgen tract of 15 acres, which cost \$8000 (and which, very fortunately, was bonded by Judge Gaffey two months ago); the Peckham property of six acres, \$5000; and 3½ acres of J. Kennagh's place, at \$500 per acre. The total cost was \$14,300. These tracts will be thrown into one, and it will have a long and ample railroad frontage, and thorough drainage to the slough. Water is abundant on this tract, and no better or more centrally located site could have been selected near town, and it is in every way satisfactory to Mr. Spreckels and associates.

OIL ON TROUBLED WATER.—The Nautical Society of Hamburg has offered a prize of 500 marks for the best essay on the subject of calming the sea by the use of oil. An exhaustive description of experiments of the effect of oil made up to the present time is required, also a criticism of the apparatus used thus far, and especially complete directions for its use by large steamers and sailing vessels.

THE STOCK YARD.

Curious Things About Shorthorns.

William Warfield, a writer on Shorthorns, presents the following interesting statements: In the early days of Shorthorns there was a tremendous preponderance of light colors. The cattle of the county of Durham and of the Ridings of Yorkshire—the parts of England from which the early Shorthorn breeders made their selections—were then, as now, red, white, and roan. It is said on good authority that there were also cattle which showed brown and black markings. The improvers had in mind the preservation of the two qualities of meat and milk. We are told explicitly that they observed the superior beef qualities of the light colors, and selected them as the progenitors of the improved cattle. In the early days white was more common than red, roans than any other two colors, with a strong majority of light roans. Among the reds the tendency was strongly toward yellow-reds. Many are described as yellow, some as dun. All dark colors were disapproved of. Nearly all the famous sires of the early days were white or light-roan, except James Brown's red bull and the great Hubback, which was yellow-red and white. Dark color was looked on as an indication of too much of the unimproved blood. This was objected to on its own account, and because the best judges esteemed light colors more highly for feeding and handling. After Shorthorns had gained a firm hold in America, many Western men began importing, and, ignorant of the historical value of light colors, and having a personal fancy for deep reds, they sought them in England. They were at first hard to find; easier, perhaps, than 50 years before, for there is a recognized tendency for a dark color to gain on a light when intermixed, but still very hard. The demand, however, as usual, created the supply, and breeders actually bred reds for the American market. The example thus set by these importers rapidly spread, and soon the attempt was made to create a prejudice against all colors but deep red and to put all others under the ban. This, of course, was resisted by all those who had the best interest of the cattle at heart, and the best judges, as well as the owners of roan cattle. To have disqualified roan Shorthorns would have been simply to have ruled out the best half of the breed. It might have proved the best thing possible for the Shorthorns, however, for if the roans had been cut off and bred separately by those independent of mere fancy they might have escaped the blight of speculation that began at this time, and have preserved a higher average excellence than has been maintained. The best judges still maintain the superiority of light colors, and, though largely banished from the show ring because the judges in many States cannot rid themselves of prejudice, they still assert themselves at fat-stock shows, and the roan Schooler and Cleveland are as incomparable in this day as the Durham ox and the "white heifer that traveled all over England as a show cow" were in theirs. There are hopeful signs that this prejudice is yielding to sound judgment. Men have ceased to expose their ignorance by claiming that white coats, which nature ever dons to save from Arctic colds, are signs of delicacy. Only two classes remain—the esthetic, who wants a red cow to harmonize with his green pasture, and the man who wants a red cow because he wants it, and it is nobody's business why he wants it red. Some day we will like tough beef, perhaps, but let us hope instead that we will learn to take a cow on her merit and not on her color, and if we like only red, to breed red, and sell red cows, without detracting from the merits or sale of our neighbors' roans.

Dehorning Cattle.

EDITORS PRESS:—In a recent issue of the PRESS I noticed an article on dehorning cattle. I have watched the progress of this seemingly powerful opposition in the East for more than a year. Some two months ago I came to the conclusion to try it, and sent to Mr. H. H. Haaff, Chicago, for his tools and book "On Dehorning." After making stanchions according to directions, and fixing the rope for holding the animal, I awaited a favorable opportunity to try the experiment. This morning was my chance, being slightly stormy, and having a dry cow besides the milkers in the corral, we decided to dehorn the old white cow. Father said she was too mean to be hurt, and we got her in the stanchions and tied, and I will admit I was very nervous at first, but before the first horn was off I was over that. I sawed both horns off in less time than I can write it, turned the animal loose, and she went out and began eating with the rest of the cattle. I will say right here that the pain, as compared with branding or castration, is as a drop to a bucketful, and they do not bleed scarcely any. I thoroughly agree with Bro. I. C. Steele in his opinion of the operation, and believe it should be practiced by every one, wintering stock and feeding them in barns or sheds. Not only will it be merciful to the cattle, but save 20 per cent of the feed. I think any one after reading and studying Mr. Haaff's book will be convinced that, as Mr. Haaff says, "it is a positive kindness to the animal."

Yours respectfully,

F. B. MORE.

San Ramon, Dec. 1, 1887.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Judge Blackwood at Oakland.

We give our readers a taste of the admirable speech delivered by Bro. W. O. Blackwood at the joint meeting of Temescal and Eden Granges, December 3d, and published in this week's *Patron*. After gratefully complimenting the sisters on the excellence of the table they had spread, and speaking of the State Grange's action in respect to female suffrage, he turned to "the day we celebrate," and his remarks were in part as follows:

The Order of the Patrons of Husbandry has already accomplished great things. Of these I will not now speak. Isaac Newton, when on his death bed, being congratulated on the great discoveries in science he had made, replied that in view of the immense field yet to be explored, he had merely toyed with the pebbles on the border. So in view of the immense work yet to be accomplished by the Grange organization, it has as yet only removed some of the obstacles found at the entrance of its field of labors. It is confronted on the one hand by the organized capital of vast resources and strength, and on the other, by the multitudinous element in the great labor centers of the country in which permeates to a most alarming extent the seeds of anarchy, looking to the dissolution of all present forms of government, and on its ruins organizing something new, and as, this element hopes, something more equitable. The Granger element of our country, as between the extremes of capital and labor, occupies a middle ground. By reason of their numbers and force of character, the Grangers of the country can hold in check the undue and oppressive encroachments of organized capital on the one hand, and the unruly and discontented labor element on the other. To accomplish this, he must rise above the plane of party politics, he must cease to shout I am for Paul, or for Apollon or for Cephas. He must cease to be a party man as such. He must rise to the plane of American citizenship and act as such. He must use his best efforts to secure as many Grangers as possible to seats in the State and National Councils. But his duty does not end here. He must appoint and send honest, trustworthy, intelligent members of the Order to the so-called third house to further legislate in the agricultural interests, or to prevent extravagant, injudicious and vicious legislation. In our own State we have had much of such legislation, among which, in my opinion, is the appropriating large sums of money from the State treasury to the support of district and county fairs, so misnamed. If properly named, they would be called district and county horse-races and general gambling resorts. In my opinion it is an outrage upon the moral sense of the people to tolerate much less to appropriate the public monies for any such demoralizing purposes.

Yes, if the Grange ever accomplishes the high purposes had in mind by the founders of the Order, it must become a potent factor in and about our legislative hall. It must see to it that capital shall not become the oppressor of labor, and, on the other hand, it must see that labor shall respect capital and not destroy it, that law and justice shall be dealt out to all with an even hand as far as human imperfection will permit.

TEMESCAL GRANGE had a harmonious election of officers at their meeting on Saturday last. It was voted to heartily accept the invitation of Eden Grange to have a joint installation of officers at Haywards on the second Saturday of January. Appreciating Brother Coulter's fine address on the anniversary of the Grange birthday, \$5 was voted toward paying his expenses, which it is hoped he will accept with the cordial good will of the Grange. It was also voted to discuss the tariff question at the next meeting, Saturday evening, Jan. 7th.

WORTHY MASTER OVERHISER has been visiting friends in Newark, N. J., and the State Grange at Trenton. He passed a night with Bro. Whitehead, N. L., and says he found him the brightest Granger he has ever met in the work of the Order. Then, after a trip to Brooklyn, N. Y., Bro. and Sister Overhiser accompanied the National Lecturer to the Pennsylvania State Grange, at Harrisburg, where they were pleasantly occupied at last accounts—Dec. 13th. They expect to get home again by the middle of January.

AGE OF THE ORDER.—In his able and interesting address at Sacramento's celebration of the Grange birthday, W. P. M. Johnston corrected an error into which a number of writers and speakers have fallen, concerning the age of the Grange. It is only 20 years old, and not 21, as has frequently been stated. It was on the 4th day of December, 1867, that the National Grange was organized at Washington, and the first board of officers installed.

JACOB HODGEN, of Frankfort, Ind., a member of the Grange and an occasional correspondent of the *RURAL PRESS*, is out here for a six months visit and was a welcome caller at our sanatorium a few days ago.

BENNETT VALLEY cordially invites all Patrons in good standing to attend their installation and harvest feast on the 7th prox.

Grange Elections.

LODI.—T. O. Shaw, M.; S. Ferdem, O.; Sister S. L. Aldrich, L.; C. W. Norton, S.; R. Pixley, A. S.; A. A. Gurnsey, C.; F. N. Smart, T.; J. D. Huffman, Sec.; C. P. Allison, G. K.; Sister Alice Allison, P.; Sister C. W. Norton, F.; Sister Nellie Hutchins, Ceres; Sister J. D. Huffman, L. A. S.

LUCERNE.—B. D. Vanderburg, M.; S. Walker, O.; F. S. Shore, L.; C. Paddock, S.; E. Walker, A. S.; Sister J. Van Tassel, C.; J. Van Vlear, T.; Sister M. Newton, Sec.; L. B. Coats, G. K.; E. Sellers, P.; B. D. Vanderburg, F.; L. B. Coats, Ceres; L. Richmond, L. A. S.

MAGNOLIA.—V. W. Still, M.; D. Bilderback, O.; W. H. Cunningham, L.; C. C. Ragedale, S.; Wm. Gautier, A. S.; J. R. Nickerson, C.; Mrs. A. M. Still, Sec.; H. A. Curtis, G. K.; Mrs. M. L. Bilderback, P.; Miss Susie Still, F.; Miss Eva Dickson, Ceres; Mrs. M. F. Gautier, L. A. S.; G. W. Cunningham, Trustee.

MARCH.—W. W. Wilbur, M.; R. K. Stevenson, O.; May Patridge, L.; A. W. Cilley, S.; R. A. Moon, A. S.; Kate Wilbur, C.; E. A. Noyes, T.; S. F. Noyes, Sec.; B. F. Stevenson, G. K.; Nannie Stevenson, Ceres; Annie Gilpatrick, P.; Lydia Porter, F.; Lizzie Stevenson, L. A. S.; A. M. Porter, Org't.

PLACERVILLE.—P. J. Isabel, M.; Albert Kramp, O.; A. S. Cook, L.; Wm. Cook, S.; J. C. Marsh, A. S.; Mrs. Wm. Hendrix, C.; J. P. Allen, T.; P. J. Munson, Sec.; Albert Norris, G. K.; Mrs. A. Kramp, P.; Mrs. Chas. Sandfoss, F.; Mrs. A. E. Olmstead, Ceres; Mrs. Combellack, L. A. S.; Miss Lina Lapham, Organtist; Jacob Lyon, Trustee.

PLUMAS.—William A. Sperry, M.; R. G. Hamlin, O.; A. B. Huntley, Lec.; Mrs. Hattie E. Bringham, S.; A. Kerby, A. S.; Miss Jennie Trimble, C.; W. E. McNeil, T.; M. B. Bringham, Sec.; Alexander Kerby, G. K.; Miss C. W. Huntley, P.; Mrs. W. E. McNeil, F.; Mrs. J. R. Enasco, Ceres; Mrs. Annie Ross, L. A. S.

SAN JOSE.—K. Pomeroy, M.; L. J. Watkins, O.; A. R. Woodhams, L.; D. H. Coates, S.; Edward Webb, A. S.; Sister D. H. Coates, C.; G. W. Tarleton, T.; O. F. Alley, Sec.; H. G. Keesling, G. K.; H. Pomeroy, Ceres; J. R. Holland, P.; N. Lillick, F.; Jennie Sanders, L. A. S.

SANTA ROSA.—Edward W. Davis, M.; Chas. D. Bonner, O.; Jonathan Roberts, L.; Eldad A. Rogers, S.; L. J. Hawkins, A. S.; Mrs. J. H. Newman, C.; John Strong, T.; Miss Martha Lumsden, Sec.; Lewis F. Chinn, G. K.; Mrs. S. J. Allen, P.; Miss Fannie Gamble, F.; Miss Ida Goda, Ceres; Miss Ella Sutherland, L. A. S.

STOCKTON.—C. Gratton, M.; M. E. Alling, O.; Mrs. E. M. Stowe, L.; Mrs. M. F. Merrill, S.; Miss Lizzie Root, A. S.; Mrs. M. Kuhl, C.; Joseph Adams, T.; M. T. Root, Sec.; Mrs. J. L. Beecher Sim, G. K.; Mrs. James Marsh, Ceres; Mrs. Eva J. Sturcke, P.; Miss Anna Smythe, F.; Mrs. S. P. Sabine, L. A. S.

TEMESCAL.—Saturday, Dec. 17: S. Goodenough, M.; W. Renwick, O.; N. Sewall, S.; A. T. Dewey, A. S.; Mrs. S. H. Dewey, O.; L. Frink, T.; Mrs. N. G. Babcock, Sec.; John Paine, G. K.; Mrs. Eliza Brooks, Ceres; Mrs. Whiddon, P.; Mrs. John Paine, F.; Mrs. Jones, L. A. S.; Miss Anita M. Dewey, Org't; W. Renwick, Trustee.

WALNUT CREEK.—J. Foster, M.; O. Sharp, O.; A. Holbrook, L.; J. W. Jones, S.; T. B. Jenkins, A. S.; Mrs. M. Larkey, C.; J. Larkey, T.; Miss M. Baker, Sec.; J. Baker, S. K.; Miss E. Kirch, P.; Miss L. Sharp, F.; Mrs. C. S. Whitcomb, Ceres; Mrs. T. B. Jenkins, L. A. S.

VALLEY.—Frank L. Loucks, M.; C. T. McClellan, O.; C. N. Wright, L.; J. Lieber, S.; P. G. Loucks, A. S.; Mrs. D. B. Dudley, C.; Chester Dudley, T.; E. A. Majors, Sec.; Geo. P. Loucks, G. K.; Flora Minaker, Ceres; Elise Gambs, P.; Mattie Wright, F.; Helena Gambs, L. A. S.; J. T. Walker, Trustee.

NOTE.—The Secretaries of Granges are requested to forward reports of all election and other matters of interest relating to their Grange and the Order.

Grange Installations.

Wheatland—Dec. 31.

Alhambra—Jan. 7.

Bennet Valley—Jan. 7.

Danville—Jan. 7.

Yuba City—Jan. 7.

Eden—Jan. 14.

North Butte—Jan. 14.

Santa Rosa—Jan. 14.

Valley—Jan. 28.

THE JOURNAL OF PROCEEDINGS at the late session of the National Grange is already printed, and will soon be mailed, together with that of the California State Grange for 1887, to Masters and Secretaries of this jurisdiction. Other Patrons can obtain copies of either or both, while the limited supply holds out, by sending stamps for mailing-expenses to A. T. Dewey, Sec. Cal. S. G., 220 Market St., S. F.

MERCED GRANGE, says the *Argus*, is taking steps to have 100 colored servants brought to Merced county from the South, to take the place of the Chinese now employed.

DR. TRIMBLE, the National Secretary, writes: "California did grandly at Lansing."

JUDGE W. O. BLACKWOOD, master-elect of Eden Grange, is on a tour to San Diego. He will visit Elsinore and other places and return by Jan. 14th for installation of officers. We hope our readers will enjoy the benefit of some of his notes of observation.

THE Lakeport *Avalanche*, having seen in our columns the likeness of the Pomona of the State Grange, remarks that Mrs. Roache is a fine, intellectual-looking lady, and the short biographical sketch proves her to be all she looks.

LUCERNE GRANGE is reported by Sister Minnie Newton, Secretary *pro tem*, to be in a thriving condition and to have given a successful public entertainment on the anniversary of the Order.

GRANGES all over the State are electing officers for the ensuing year, and making quarterly reports more regularly and promptly than has happened in California before for many years.

BRO. WEBSTER's family, who are still at East Oakland, expect him up from Creston for a holiday's visit.

EDEN GRANGE has invited Temescal to a joint installation and Harvest Feast, Saturday, Jan. 14th.

The Oroville Fair.

The First Butte County Citrus Fair, for which so lively preparations have been making, was happily opened on Tuesday. The display, as previously announced, is made within a canvas tent, covering a space 50 by 150 feet, and high enough to inclose half a dozen well-grown bearing orange trees, 20 to 25 feet in height, loaded with their ripened fruit.

The whole interior is neatly trimmed with boughs and festoons of evergreens—fir, cedar, citrus, and pepper—set off with bright-hued oranges, lemons and holly berries, and brilliantly electric-lighted.

The exhibits are said to embrace fully 40,000 oranges and lemons, contributed by about 400 different persons, and arranged in many ingenious and pleasing designs.

Although the fair is, in name and character, dominantly citrus, there are other fruits in great diversity and abundance.

Fine pomegranates and handsome Japanese persimmons of many varieties are there. Yellow pippins, red Astrachans, and about 30 other kinds of apples are displayed. Winter pears, fresh grapes, figs and tomatoes, almonds, chestnuts, black and English walnuts, pecan-nuts and olives are among the products to be seen, while limes attest the mildness of Butte county's climate. A fine collection of grains grown in the district interests the farmers; and the showing of flowers and pot-plants is greatly admired.

Gov. Waterman, before the formal opening took place, had already telegraphed to the *S. F. Chronicle*: "The citrus fair at Oroville has the finest display of fruits and fancy designs I ever saw. It will pay any one to come and see it." At the exercises Tuesday evening Senator Jones called the closely packed assemblage to order and introduced the Governor, who made an informal address, in which he alluded to his mining experiences on the Feather river and at Bidwell's Bar. He said he had been at the last-named place that very day, but all things had changed, and now the far-famed orange tree was the only landmark recognizable. "That tree is the pioneer of the grand product and industry being celebrated here to-night."

He said that he visited this section last winter and was satisfied it possessed as good a soil and climate for oranges as could be found in the State. The completion of the railroad to the north opens up a new and unlimited market for citrus fruits throughout the Northern and Northeastern States and Territories. He advised every man and woman to engage in orange-growing, as it would soon become a very profitable industry, and an over-supply could not be grown. He said he would not bother much with lemons and limes, as they were very tender growers, but the orange tree was hardy.

He advised growers not to plant anything but budded trees, as they would commence to bear in two or three years, while seedlings would require eight years or more before bringing returns.

He said that while he believed that Butte county was going to rival any part of the State in producing citrus fruits, we need not have any strife with any other section. He belonged to California and not to any particular corner of it. All the State was grand, and he would sooner live in the poorest place in California than in the best place east of the Rocky mountains. "Don't tell here, in Butte county," he continued, "how you can beat Los Angeles, or San Bernardino, but go to work and beat them with your superior fruits and products, and when you hear of anybody in the southern part of the State talking against this part of the State, you may know that they are either weak-minded or real-estate agents, for most of the people there are above such a dishonorable course."

Remarks of congratulation were also made by Ex-Gov. Perkins and Hon. J. K. Luttrell, and the latter is booked for another address during the fair, which is to continue until Saturday evening.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

STUMP-LIFTING.—Livermore *Herald*: J. D. Smith has had considerable experience lately in removing oak stumps by the slow method of grubbing them out, and has been desirous of securing a more expeditious way. So Thos. Varney, president of the Bank of Livermore, a notable inventor of important processes in the manufacture of giant powder, sent up an expert workman thoroughly familiar with the use of the explosive. A monster stump, solid and tough, the remains of an enormous oak which formerly stood on the Bowles place, was selected for the experiment. An excavation was made and a small shot put directly beneath the stump. This was set off and considerably enlarged the chamber, which had originally been made with a crow-bar. In this chamber was placed a package containing 8 lbs. of low-grade giant powder, costing 9 cents per lb. When this was exploded that stump rose into the air, and the work of a week or 10 days was accomplished in less than a second. The result was a complete success, and in order to allow our farmers a chance to see the work done by the charge, he has left the shattered stump just as it lay after the explosion.

Amador.

SEEDLING ORANGES.—James McCauley, an Amador pioneer and one of the solid citizens of Ione, sent the *Record Union* a fine box of oranges, Dec. 12th. In the letter which accompanied the fruit he said: "The oranges I send are 'seedlings,' grown within the limits of Ione City, on gravelly hillside land, with but little irrigation and no care. The tree from which they came is seven years old, planted by Phil Kennedy as a curiosity in his yard. I send this sample as a simple proof of what our gravel foothill lands are capable of producing. In addition to these oranges, we have for the last few days been enjoying the luxury of green peas, grown in the hills near Ione. It seems to me that our agricultural people are behind the times in developing the resources of our chaparral lands. But little irrigation is necessary to grow fruits or vegetables on these foothill lands, and that only in the early summer when water is abundant. Innumerable ditches, formerly used for mining purposes, run all through the foothills of Amador, and but little repairing is needed to put them in order. With the waning of our placer-mining interests, and its network of ditches, it seems opportune that the miner should turn his pick into the pruning-hook, and from the wreck and wash of his ancient gold mine he should now gather a harvest of golden oranges. True, there is no vast area of these lands capable of producing oranges, but there are numerous little vales and hill-sides susceptible of their highest cultivation, and when taken in connection with the cultivation of deciduous fruits and vegetables, are sufficient for homes for many families."

Contra Costa.

MANGOLDS.—Antioch *Ledger*, Dec. 10: Monday morning J. T. Renas brought to Antioch a wagon-load of mangel-wurzels, every one of which was a giant. One beet weighed by L. Meyer tipped the beam at 59 pounds, and it was taken at random from the top of load. The monster roots were raised on the sediment land in the Marsh creek country, not far from Iron House district schoolhouse. Mr. Renas says he raises from 35 to 36 tons of beets per acre and from 25 to 30 tons of carrots.

Lake.

WINTER SPECIMENS.—Clear Lake *Press*, Dec. 17: Mr. A. Anderson has sent us from his ranch near Copsey Springs a bouquet of sub-tropical plants grown in the open air and gathered in December after the coldest weather known here for years, and which shows no signs of frost. The collection contains grapes in green foliage, branches of apple, peach, orange and other fruits, with fig branches bearing fruit, roses, castor beans and many plants which we cannot name.

EARLY LAMBS.—Already young lambs are making their appearance among many sheep folds here. Rather early, we should think, judging from the new feed but recently started, and unless much attention is given them both young and old will perish before shearing time arrives.

Mendocino.

SHEEP DECREASING.—Covelo correspondent Ukiah *Press*: There are not as many sheep in Round Valley township by 40,000, as there were five years ago. This great decrease has been caused principally by lack of care. Years ago herding sheep meant staying with them in the day, and corralling them at night. This has been discontinued, and now they are turned loose upon the ranges like a band of Spanish cattle, and are allowed to go where they please. The consequence is they are destroyed by bears, panthers, coyotes, eagles, etc., and are absolutely unprotected. The sheep-raiser is fortunate who can make his old stock good at the end of the year. Under the old system it was not uncommon to have an increase of 70 or 100 per cent.

Los Angeles.

EDITOR *PRESS*: Farmers hereabouts are busy as bees sowing barley and wheat. The ground has been in excellent condition since the rain; but it is getting pretty dry again, as the north wind prevailed yesterday and last night beyond

anything we have had from that direction since I have been here—some two years. There will be a much larger acreage than usual sown to barley and wheat in this valley this season and less corn planted. Vineyards are being dug up preparatory to sowing alfalfa and other crops, the reason for which is the low price of grapes and mysterious death of the vines. D. J. O.—*Spadra, Dec. 14th.*

ENORMOUS ROSE-BUSH.—Orange *Tribune*: There is a climbing rose-bush over the door of Henri F. Gardner's home, of the white La Marque variety, which covers the entire front of the house, a surface of 884 square feet. The main stem is 56 feet long and measures 19½ inches in circumference. It was planted 12 years ago and commemorates the birth of Mr. Gardner's oldest child.

Napa.

ST. HELENA SAMPLES.—Independent: Mr. Beach sends to the State Board of Trade rooms, S. F., to-day, for W. H. Castner, the following articles: Italian chestnuts, English walnuts, almonds (soft-shell), popcorn, Dent corn, late seedling prunes, late wild plums, Japanese persimmons, Italian medlar or bread-fruit, Texas streaked apples. Let others come to the front at once and not have Napa's space lying idle.

Placer.

EXHIBIT SENT SOUTH.—Auburn *Republican*, Dec. 14: The carload of oranges for Los Angeles was made up at Newcastle yesterday and went off by the afternoon passenger train. It contained nearly 25,000 oranges and a large quantity of persimmons, raisins, olives, etc. A large banner was attached to the car, reading "Placer County Citrus Products for Los Angeles." The gentlemen accompanying the exhibit are E. W. Maslin, J. J. Morrison, J. F. Madden, P. W. Butler and Robert Jones. W. B. Lardner will go down next Friday.

EXTENDING IRRIGATION.—D. Van Lennep is making a preliminary survey for a new ditch from the point where the Bear river branch crosses the Grass Valley road to the vicinity of Lincoln. The present ditch to Lincoln was constructed for mining purposes in early days and did not take the course of the highest ground. The new ditch is designed to follow the trend of the highest hills close along this side of Bear river so that water may be conducted to thousands of acres now given up to brush and the grazing of a few head of stock. The soil in that locality is good, like all the foothill soil, and if the new ditch is built this spring, as is now the intention, a new fruit-growing district will be opened up which will afford room for hundreds of new homes.

Sacramento.

RAISINS.—Bee: It will surprise most people to learn that in the month of November last 788,370 pounds of raisins were shipped from Sacramento. In October the shipments were even larger. About all of this heavy product is from the raisin belt included in the strip a distance of 20 miles west of Sacramento. It may be asked why more raisins are not packed in Northern California. The reason is plain enough. The finest shipping grapes in the State are grown in this section, and our vineyardists have preferred to ship to Chicago, Boston and New York the product right from the vine.

San Joaquin.

WOODBRIDGE DOTS.—Cor. *Lodi Sentinel*: The irrigation floodgates have been opened, and our summer-fallowed land is receiving great benefit therefrom. . . . In the yard of the Plummer hotel is a small orange tree which is well loaded with luscious fruit. Some of the oranges are ripe and of excellent flavor. . . . Our town is flooded with excellent mountain apples, which for flavor cannot be beaten.

STEAM PLOWING.—On his ranch about six miles southeast of Lodi, Robert Coffee has running an eight-horsepower traction engine, drawing two four-point ten-inch gangplows, which turn over about 20 acres of land per day. Two men are all that are needed to run the business, and the cost will not amount to 50 cents per acre. Indeed, the parties in charge agreed to plow 18 inches deep for Middlekauff & Co. for 50 cents per acre.

Santa Barbara.

GLOBE BEETS.—Lompoc *Record*: Mr. Shoults has brought in a sample of Globe and Tankard stock beets such as he has a small 30 acre patch of. The Globe weighs 60 pounds and is not the largest in his field by any means.

Santa Cruz.

A CHAMPION SPUD.—Surf: Not peerless in name only, but in attainments also, was the wonderfully huge and handsome potato from the ranch of K. F. Redman in the Pajaro Valley, presented to the Development Association by the grower. This potato measures 29 inches in circumference the long way and 14 inches the other, and weighs 4½ pounds. It is not a monstrosity in shape nor an aggregation of tubers grown together, but simply the growth of one season from one eye, smooth, fair, and perfectly sound.

Santa Clara.

PRIZE ORCHARDS AND VINEYARDS.—San Jose *Herald*, Dec. 14: The committee appointed at the late fair have made their awards on sweepstake orchards and vineyards, as follows: Vineyards—C. P. Howes, 80 acres, on Saratoga and Mountain View road in Collins' School District, 1st premium, \$75; Mrs. E. Cornish, 40 acres, 2d premium, \$25. Orchards—J. H. Flickinger, on Berryessa road and Lundy Lane,

220 acres, 1st premium, \$75; Orvis Stevens, Coyote, 35 acres, 2d premium, \$25.

GILROY CANNERY.—San Jose *Herald*, Dec. 17: Yesterday articles of incorporation of the Gilroy Fruit-packing Co. were filed with the County Clerk. The announced objects of the company are to carry on a general manufacturing and merchandising business in canned and dried fruits, vegetables, etc. The capital stock is fixed at \$20,000, divided into 800 shares of the par value of \$25 each. The Directors are O. M. Welburn, James C. Zuck, L. A. Whitehurst and Thomas Rea of Gilroy and William Buck of San Felipe.

Solano.

EDITORS PRESS: The nights are cold and frosty without much signs of rain. The roads are good, but rough. The grass is growing rapidly and the hills look quite green in places. Everybody is busy. Those who have ground to plow for hay are plowing as fast as possible. We have had between two and three inches of rain, and the ground plows well. Adobe lands are working exceptionally well, as they are not wet through, and "doby" never does work well unless it can be plowed between the wet and the dry.

Quite a large number of trees will be set out near here this season. W. B. Long will set out 3000 peach trees. There is much more demand for peach trees than for apricots. Parties in S. F. are offering to make contracts for dried peeled peaches here at 18 and 20 cents per pound, and take all that can be delivered for the next five years. There is a large profit in raising and drying at these prices, and quite a number will set out peach orchards who would not have done so otherwise.

A large portion of California will raise good apricots, but the number of acres that will raise good peaches is comparatively small.—G., *Vacaville, Dec. 20, 1887.*

Sonoma.

WILL APPLES PAY?—*Courier*: A gentleman living not far from Petaluma has about ten acres mostly in apple orchard. He will sell this year over 5,000 boxes of apples. He knows how to pack and ship his fruit and having good varieties always gets the best price. He estimates his income this season over expense at \$5,000. This will give him \$500 per acre. But suppose his crop would only bring in one-fifth of this sum—it would still pay better than grain or potatoes. When men say that apples properly selected and cultivated will not pay, they don't stop to consider. An old apple grower informs us that they will pay even if the crop has to be sold for an average of 25 cents a box.

PICKLING OLIVES.—S. Rosa *Democrat*, Dec. 17: Guy E. Gross, has finished harvesting the crop from his large olive orchard on Rincon Heights. The olives are well developed, and have arrived at a perfect maturity. The whole crop will be pickled.

Sutter.

THROUGH LAVA TO WATER.—Noyesburg Cor. *Farmer*: Many of the wells about the Buttes have failed to supply the usual amount of water this season. I have a dug well, 34 feet deep, and had a windmill in it until a year ago. It not affording sufficient water, I put in a steam pump which worked very finely, but would pump the well dry in 10 or 15 minutes. I concluded to bore deeper—should have dug deeper but for the hardness, which was of lava formation, and the trouble of keeping the water out while digging. L. P. Denney of Gridley started a ten-inch hole and drilled four feet, but making slow progress, concluded to try a five-inch hole. This he continued to the depth of 36 feet, all the way through lava, being satisfied that it would supply all the water needed. We replaced the pump and pumped four hours with no apparent diminution of the water, in the meantime filling my tanks, which hold 6500 gallons, with pure, cold, soft water.

ARIZONA.

OAT HAY.—Florence *Enterprise*: The experience of the farmers of this valley in growing oats has been somewhat varied. Some of them met with no encouragement, and abandoned all efforts in that direction, while others pronounce it the best and most profitable forage crop that can be cultivated. The latter, however, raised oats exclusively for hay and harvested very heavy crops. Whether satisfactory results would have attended a mature crop of oats after the thrasher had separated them is still an uncertain question, but there is no good reason assigned for any failure in their cultivation.

ALFILERILLA has made its appearance in many places along the San Pedro and adjacent ranches. It is now several inches high and furnishes the best of feed for cattle. Ten years ago not a single spear of alfilerilla existed in Pinal county, but it gained a foothold from a flock of sheep brought from California to Canyon de Oro, and from this small beginning it is rapidly spreading over the country this side of the Santa Catalinas.

FIG ROOTS.—The roots of the fig-tree sometimes reach down in the ground to an astonishing depth after moisture, and almost rival the blue-gum in this respect. In repairing his pump placed 12 feet below the top of the well, Mr. J. C. Harris found a few days ago that the roots of an adjacent fig-tree had followed the curbing down to that depth and possibly extended further. This is undoubtedly the secret of the wonderful success of the fig in this valley, as its roots seek the moisture from great

depths, and eventually become independent of the surface irrigation.

NEVADA.

INDIGNANT SHEEPMEN.—The sheepmen of Washoe county are up in arms against the railroad company, and many of the largest operators have decided that hereafter they will not lease land for grazing purposes, and will drive their flocks elsewhere. They complain that, although they pay the company the rental demanded, no protection is afforded them in the event of other sheepmen trespassing on the leased lands, which is not infrequent. The lands mentioned are those which the railroad company refuses to pay taxes on, and, in the language of a sheepman: "If the railroad company refuse to pay taxes on the land, what right has it to lease them?" The above conundrum is agitating the assessor's mind, and it is thought the courts will have to solve it.

Be Careful With the Gas.

Last week two Chico ladies came down to San Francisco to do a little Christmas shopping together. In the day-time they were out looking around and making their purchases, and at night they went to sleep at a private lodging-house, where, in the morning, they were found dead in their bed, having been suffocated by escaping gas. It is inferred that one of them blew out the light on retiring instead of turning the stop.

We note this sad occurrence in order to caution every one who goes from a place where gas-lights are not used, to visit the city where they are used—to caution him or her that gas-lights must always be extinguished by carefully shutting off the gas, and never by blowing out the flame. The latter is suicidal. And it is necessary not only to see that the light goes out when the stop is turned, but also to make sure that the stream of gas remains cut off; for some fixtures are defective, and allow the stop to be turned too far around.

Recollect this when you visit the city. If need be, ask some one at the house where you lodge to show you just how to handle the gas fixtures. It is a matter of life and death.

Silviculture Exhibition in Brussels.

EDITORS PRESS: At the great International competition of Science and Industry to be held in Brussels in 1888, there will be a competition in Silviculture, the nature of which is indicated by a circular just issued. Applications must be filed before January 15, 1888, and entries made before April 15, 1888, with Armstrong, Knauer & Co., 822, Broadway, New York. The importance of Forestry is becoming better recognized every day. Already several Forestry Bills have been introduced into Congress, and it will not be long before there will be a demand at paying rates for those skilled in Silviculture. Our forests protect our valleys from torrents and keep up the flow of our springs and streams through the dry season. As they protect us so we must protect them. Forestry offers a promising career for young men and for those skilled in it in this country. The Brussels Exhibition holds out fine inducements to Foresters. It will pay to take an active interest in its Silviculture competition.

ABBOT KINNEY,
Chairman late Board of Forestry.
Lamanda Park, Cal.

We would print the circular to which Mr. Kinney alludes if it were possible to give space to it. Suffice it to say that provision is made for competitive exhibition of almost everything that can be thought of concerning the art and science of forestry. The circular may be seen at this office, or any one interested can no doubt get a copy by writing to the American agents for the Brussels Exposition, Armstrong Knauer & Co., 822, Broadway, N. Y.

SOLDIERS' HOME AT SANTA MONICA.—The Board of Managers of the National Home for Disabled Soldiers has located the Pacific Coast Branch at Santa Monica. The people of that locality offered as an inducement to make the selection 350 acres of land, worth \$300 per acre, besides \$100,000 in cash. General Black, one of the Board, says the climate is perfect, and the site, though it overlooks the ocean, is sheltered by the mountains, and is easily accessible by railroad. The Commissioner also added: "California cannot be over-praised. It is a land of oil, wine, fruits and flowers, with the riches of Ophir, and the most energetic people in energetic America."

GRAPE GROWERS' MEETING.—A regular meeting of the Grape Growers' and Wine Makers' Association of California will be held at the Grand hotel, San Francisco, on Tuesday, the third day of January, 1888, at 11 o'clock A. M.—E. H. RIXFORD, Secretary.

THE northern citrus belt means to be represented in Southern California. Marysville sends ripe oranges, lemons and Japanese persimmons to be shown in Los Angeles, and the Placer Board of Trade is this week dispatching thither a carload of citrus exhibits.

A FINE life-size portrait of Queen Victoria, in colors, surmounts the calendar for 1888, with which Jos. A. Hofman of this city reminds his journalistic friends that he keeps books, maps, and stationery at 208 Montgomery street.

California Dried Fruits and Nuts.

Review of the Production of 1887.

George W. Meade & Co. of this city public service by the care they take in preparation of a general review each year of the California production of dried fruits and nuts. We are favored with advance proofs of their review for 1887, which our space does not allow us to present in full, but we give what seems to us the essential parts:

General Estimate of the Product of 1887.

			Pounds.
Raisins, 20th boxes..	800,000	Nectarines, sun-dried.....	100,000
Honey extracted	Lbs. 1,090,000	Figs, ".....	90,000
Honey, comb. ".....	250,000	Apples, evaporated....	550,000
B. eswax ".....	25,000	Apricots ".....	3,000,000
French Prunes ".....	1,750,000	"bleached..	50,000
German Prunes ".....	75,000	Peaches, evaporated, peeled.....	500,000
Apples, sun-dried.....	200,000	Peaches, evaporated, unpeeled.....	750,000
Peaches ".....	1,750,000	Plums, evaporated.....	50,000
Plums ".....	400,000	Nectarines ".....	50,000
Pears ".....	40,000	Walnuts.....	1,500,000
Grapes ".....	800,000	Almonds.....	500,000
Apricots ".....	200,000	Peanuts.....	250,000

California Raisins.—After a careful review, we estimate the out-turn for 1887 at 800,000 boxes, and divided as follows:

Fresno District, boxes.....	350,000
Tulare District, ".....	10,000
Riverside District, ".....	180,000
Orange and Santa Ana District, boxes.....	85,000
San Diego District, boxes.....	20,000
San Bernardino Co., boxes (outside of Riverside District).....	10,000
Yolo and Solano, boxes.....	125,000
Scattering—Yuba, Butte, Sacramento, Placer, etc., boxes.....	20,000
Total, boxes.....	800,000

Owing to heavy and untimely rains which did great damage in some of the largest raisin sections of the State, the output fell considerably short of calculations made early in the season, and which were based on the heavy yield of the vines. This, however, is not apt to often occur, and had it not been for this unfortunate turn of affairs the product, as at first estimated, would undoubtedly have reached 1,000,000 boxes of 20 pounds each.

The consumption of California raisins on the Pacific Coast and Territories we estimate at 100,000 boxes yearly.

As was the case last year, it will be noticed that Fresno again heads the list, and the development of the raisin industry in that portion of the State is not only wonderful, but startling. A few years ago Fresno county was looked upon as a barren plain, but to-day it is the great raisin section of California, and within a few years promises to be the raisin section of the world. It is in fact the home of the raisin, the apricot, the peach, and the nectarine; and all these fruits not only grow there in the greatest profusion, but they are ready for Eastern shipment from two weeks to a month earlier than any other portion of the State.

The outlook for the raisin industry of California is more than brilliant. We have the U. S. for a market, and when we have supplied that, we can go abroad. The writer of this stated a few years ago that it was only a question of time when California raisins would drive the imported from American markets forever. That time is rapidly approaching. It may be of some interest to know what quantity of fresh Muscat grapes were consumed in making these raisins this year. Here are the figures: 16,000,000 pounds raisins equaling 55,000,000 pounds of fresh grapes.

This will equal 3000 cars of green grapes alone for raisins, but it must be remembered that this does not include the great trains of these Muscat grapes shipped East in a fresh state, nor does it include the vast quantities used for home consumption and in canning, etc. Truly this is a wonderful land.

At present stocks here are about exhausted, and we shall enter the new year with small supplies and firm in the faith that next year with the new vineyards coming into bearing, and good weather, that California will turn out in the neighborhood of 1,500,000 boxes of raisins or 30,000,000 pounds, consuming in their manufacture at least 105,000,000 of fresh Muscat grapes.

We also append herewith the production of California raisins, from the year 1873 to 1887, showing the growth of this industry:

boxes.	boxes.
1873.....	6,000 1881.....
1874.....	9,000 1882.....
1875.....	11,000 1883.....
1876.....	19,000 1884.....
1877.....	32,000 1885.....
1878.....	48,000 1886.....
1879.....	65,000 1887.....
1880.....	75,000

Previous to 1873 but few raisins were put up here and as might be supposed of very inferior quality. The product continued to increase slowly until the year 1882, when new vineyards coming into bearing, it jumped rapidly until present figures were reached.

California Prunes.—The out-turn this year we estimate at 1,750,000 pounds. This was the "off" year for prunes and the crop was some less than last year, though in size the fruit generally run larger and better and has brought greatly enhanced prices, so the deficiency in quality has to a considerable extent been recouped by the increased value. We write on the California prune industry with as much pleasure as we do on raisins, for both

(Concluded on page 511.)

A Christmas Idyl.

[Written for the RURAL PRESS by Mrs. M. F. ROWE.]

Go sound the loftiest music,
And sing the grandest song,
That as the surging ocean,
Shall stir the soul's emotion
As its chorus rolls along.
Yet, let it be sweet and gentle,
Soothing the heart to rest;
And full of joy and gladness,
Banishing care and sadness;
Such as children love the best.

Hark! o'er the plains of Judah,
The chorus loud and long;
As rising high and higher,
From bright, celestial choir,
Bursts forth the joyous song.
A pause—a hush—a silence—
Then, a cadence low and sweet;
O'er all the senses stealing,
At vesper bells soft pealing
The echoes clear repeat.

"Glory to God in the highest!"
Angels rejoicing sing;
"For blessed peace is given
On earth as 'tis in heaven,
To-day is born a King."
Oh! wondrous heavenly music,
The echoing hills repeat;
Never can earth-born chorus,
Excel that anthem glorious,
So grand and yet so sweet.

Tell me a simple story,
A story, strange, but true;
Of heroic self-denial,
Of victorious faith in trial,
A story old, yet new.
Let it be full of wonder,
More than in fairy tale;
Yet, let its truth and beauty,
Lead in the path of duty,
With a power that cannot fail.

In language plain and simple,
I read of a wondrous life;
Of One, most pure and holy,
Who dwelt among the lowly.
Who, in this world's mad strife,
From turmoil, sorrows, cares,
Offered a perfect rest;
Brought joy to hearts so weary,
Light, where 'twas dark and dreary;
Spoke peace to troubled breast.

Go, and from quarried marble,
Carve me a form in stone;
That above all else shall tower,
That shall show the skill and power,
Of a Master hand alone.
A stone that shall stand unshaken
By the dashing waves of time;
That through all coming ages
The thought of men engages;
Majestic, grand sublime.

Then from the quarried marble,
A form rose, grand and fair;
Telling a wondrous story,
Crowned with eternal glory,
Behold it standing there,
Rising above life's ocean,
Where angry billows toss
Above the clouds that lower,
Rising in strength and power,
That form—a simple cross.

Paint me a lovely picture,
A beautiful scene and fair:
That, to weary, longing eyes,
Shall be a glad surprise,
As they gaze in wonder there.
A picture all resplendent,
With glorious sunshine bright,
That shall cheer despairing sorrow,
Pointing onward to to-morrow,
When darkness yields to light.

See, on the glowing canvas
Appears a beautiful scene;
A scene of early morning,
Bright flowers the earth adorning,
The hillside clothed in green;
The sun's first rays appearing,
Dispelling mists and gloom;
The form of One, all glorious,
Rising o'er death victorious,
An open, empty tomb.

Oh! art and rhyme and music,
Combine to tell his fame!
Who, from the courts of glory,
Repeat, ye winds, the story,
Unto our dark earth came.
Come, mortals, come, and gladly
Your choicest treasures bring;
Worship in awe before him,
With holy joy adore him,
To-day, accept your King.

Grass Valley.

INK AND PAPER ON THE EYES.—The revived discussion as to the combinations of ink and paper least trying to the eyes of readers has, in this country, brought into public notice newspapers printed with black ink on red and green paper. A German printer of Arnheim, on the other hand, enthusiastically advocates the use of blue ink upon green paper as the least hurtful tints for the eyes to dwell upon.

Christmas Among the Blizzards.

A Strange Story for Young California Readers.

[Written for the RURAL PRESS by PIONEER.]

A rainy Christmas and a Christmas without children! How strange and unnatural it seems to me! As I lay awake this morning before daylight and listened to the "patter patter" on the roof, the memory of other Christmas days came to me most vividly—to those days when snow and storm were a never-failing accompaniment, as much so as the eager, excited chatter of the little ones who were awake before the sun, always, to find the stockings in and under which Santa Claus had placed his wonderful gifts. Among all those bygone Christmas days one stands out so clearly, and was preceded and followed by such strange scenes, that I think a little story of them may please you to-day.

On the 15th of October that year, came to the States of Iowa, Wisconsin, and to Dakota,

and tough. We were needed at home, and so bundled up with my feet in a bag of hot oats, I was lifted to my seat, and left a throng of doleful faces at the door. Shall I ever forget that terrible day's ride—the beginning of a time full of new and eventful scenes? Nothing more than frozen ears and fingers to my friend and terrible chills for myself, occurred, yet it seemed weeks instead of hours before we reached our home. Then came several mild days, and on the last of them, just at night, I heard the jingle of bells and the shouts of my two little grandsons, six and eight years old, and on running to the door, found a sled with a small box of coal, sent by my son from the Falls. He had sent half he had (so he wrote), but many tons would arrive in a day or two on the railroad. When it came he would send over a load, and come for the bags.

They were all excitement at being allowed to come for a day or two, and brought their skates, and a new Christmas sled, and some dainties for the table, hard to get on a farm; and that evening we had a jolly time, with stories and talk of Christmas joys.

But in the morning! Once wide awake, the

"Glory to God in the highest,
and on earth peace,
good will toward men."

"TELL ME A SIMPLE STORY, A STORY STRANGE BUT TRUE"—A Christmas Idyl.

a storm of unexampled severity—blizzards with snow so deep that no trains ran for several days on any road, and freight trains delayed at that time were in some places blockaded all winter.

To us in Dakota the fact that this storm came before our winter supply of fuel was secured, had a significance that in this land of mild winters and abundant fuel cannot be appreciated. In many little new towns in Dakota, what to burn and how to keep warm was the question of all importance for many long months thereafter.

There came some warm days in November, but not enough to melt the drifts which in many places were only thawed a little, to freeze again like icebergs ready to catch the next snow.

This winter found me in a farmhouse far from neighbors and from any public road; the children, who at that time formed my family, were teaching, and at school a dozen miles from me. I was brave enough to take advantage of a mild time the day before Christmas to go 20 miles to Sioux Falls, where a happy family of grandchildren and their parents awaited me.

On the Christmas morning the blizzard again raged with snow and sleet, but it was little heeded, so pleasant and happy were the surroundings. The day following, however, the neighbor with whom I went and I found to be one of the coldest in the season. It was pronounced dangerous in the extreme for us to go home. The thermometer stood at 30° below zero; the wind was high; the road partly bare of snow, and in other places was drifted on fences, and we had only a buggy. But the horse was grand and my young friend brave

and sound of the blizzard was in our ears, and the first rays of light showed us a storm so severe that one could not see a yard beyond the porch. The snow came in sheets, and the hired man when called from slumber announced that he dared not go out to the barn at present. As usual, I enjoyed the storm, and after a warm breakfast announced that "the stock must be fed, and if Charlie could not get to the barn I could;" but armed with a bunch of laths and imbibing a little of my courage, he concluded to go. The laths were to put up one at a time in the snow so as to aid him in finding the way back to the house. Strange as it may seem to you, this was necessary, as there were repeated instances that year of men lost and frozen in the way from the barn to the house.

Charlie made out at that time to feed everything and supply all the stock with water, but the storm increased; by night the drifts around the house were higher than the doors and lower windows. We were warm and cosy in the house—rather enjoying the storm—the boys happy because they were sure it would be impossible to get home for a few days. Little did any of us imagine that eleven weeks would pass before they even heard from home or saw a barn near us!

Next morning it still snowed, and still blew. It was impossible to open the stable doors, but a hole was cut in the roof and plenty of hay and corn taken to the animals within. Clothes-lines and laths made a safe guide back to the house.

That morning our nearest neighbor came on snowshoes (Norwegian ones) to ask if we "still lived," and what we had in the way of provisions. He knew that in some houses there would be great scarcity, but we of course had plenty

of everything, and some to lend if others needed sugar or flour, etc.

Brave words these, but the time came when we had no bread, nothing to make it of—bushels of wheat at the mill but no possibility of reaching it. We had five hundred bushels of wheat in the granary, so we would not starve. We boiled it, we hulled corn, we parched corn in a spider and ground it in a coffee-mill and then made pudding of it—the children enjoying the fun. While the sugar lasted the boys lived like princes, but when that was gone and even the milk failed us, they made no complaints. Their father inquired of this youngest: "You were hungry sometimes, were you not, Ernest?"

"Why, no," was the answer; "you see if there was nothing to eat in the house, when it was time grandma always had a good meal!"

There were some potatoes; once in awhile we killed a chicken to save its life. The boys had brought not even a change of clothes, but I made over some of their uncle's garments and had warm flannels and overalls with pistol-pockets, knife-pockets, etc., and thought they never were as well dressed in their lives.

The neighbor came over and made them snowshoes, and then when the sun shone I sat wrapped up at an upper window and saw them use them on top of the eight feet of snow, never daring to trust them alone. Several times friends from Canton, 12 miles off, on a tramp to Yankton (80 miles away where the Legislature was in session, which they had no way to reach except on snowshoes) called at the house with news from the children at school. On one occasion they brought word that the man where my daughter boarded was dead. My little fellows seemed saddened for the first time by this tidings, and the older one said:

"Why, grandma, would I know if my father died?"

I said I did not know how we could hear; but Ernie, patting his brother on the shoulder, remarked:

"Never mind, Paul; we can cry just as much when we do hear."

How did we keep warm? It is hard to tell. We burned all the corn that was in the crib (that in the field was burned, stalks, and all, below the snow). We burned up the new corn-crib and took down the partition in the granary for fuel, and we burned the cellar stairs. Cases all over the Territory were common where several families lived in one house and burned the others. We heated water whenever we made fires and filled jugs which kept us warm in bed, where we spent much time. Oh, the books that I read aloud to the boys in those days. They were allowed to paste up *Harper's Weeklies* by the stove in the kitchen, and enjoyed them many hours.

Once my son came home. He was seven hours coming the 15 miles. What a time we had! But he spent only two hours with us, as he must be back to the school he was teaching. He thought us so well off, and in comparison with those of whose homes he told us, we thought so too. His scholars all came on snowshoes, and the fact that the fuel for the school had been procured the summer before, made the schoolhouse the most cheerful place in the township.

In towns this same dearth of fuel continued for four months. No train went over the prairies. Two or three fires were all that could be kept in a town of 200 inhabitants. The people crowded together, cooked what little there was to cook, and hurried back to bed. In Sioux Falls, all railroad ties, the lumber in the yards, the grain in the elevators, was burned, sold to those who had money, given away to those who had none.

A time came at last when we heard that a train was expected to go from Canton to Sioux Falls, and I started on snowshoes with the boys for the main road, a mile distant. It was an all-day ride to get to Canton, on top of a load of wheat, but before evening we reached a friend's house, and waited two days before the train, heralded with cheers, came on and pulled out for Sioux Falls with my boys on board. Fifteen miles were compassed by the cars in eight hours, the little fellows sleeping quietly until their happy father took them from the train. That train did not come back to Canton. Next day came the melting of the snow, the destruction of bridges, the carrying away of whole towns; nearly the whole of Vermilion, with smaller villages, going down to the Mississippi. You are all aware of this destruction of life and property by the melting of the snow, which for so many weeks covered these States and Territories. It was the middle of May before the cornstalks were reached by the melting of snow, and the stable doors all unloosened so that the imprisoned cattle and horses could be brought out. I had read when a child of a storm in Pennsylvania, where grandmother and children were caught in a house and imprisoned many days, the house being entirely covered. Until the events of this winter it seemed like a fable; since then it is quite thrown in the shade by experiences of my own.

Mrs. CRAIK was prompted to write her last book, "An Unknown Country," which discusses the condition of the poor in the north of Ireland, by overhearing the remark of a laboring man, who, when rallied upon helping a little girl across the street, replied: "Ay, but a 'andful of 'elp is worth a cartload of pity."

MISS MURFRE (Charles Egbert Craddock) will spend most of the winter in Boston.

YOUNG FOLKS' COLUMN.

The Christmas Gift.

(Written for the RURAL PRESS by IRA A. ADAMS.)

I once knew well a little lad
Of years some three or four,
Whose parents were respectable,
Although most wretched poor.

Of children they had—let me see,
Jane, Kate and Caroline,
Tom, Jim and Jack, Sam, Frank and Fred,
The youngest of the nine.
And now, to Freddie's great surprise,
Another child was born;
"A Christmas Gift," his father said,
For it was Christmas morn.

But little Freddie's loving heart
With grief seemed running o'er;
He said: "Papa, you can't find bread
To feed one baby more."

"Remember, child," his father said,
"God loves his people still;
He'll ne'er send children little mouths,
But he'll send bread to fill."

"I know, but then you see," said Fred,
As tears rolled down his face,
"God always sends us little mouths,
And bread, some other place."

Bay State Garden, Calistoga.

Our Christmas Tree.

(Written for the RURAL PRESS by AUNT SUSIE.)

"Now, children, you must all go to bed, for to-morrow is Christmas, and you will want to be up early. I think Santa Claus will come soon after breakfast and bring or send a tree full of nice things. Run off to bed now."

So with a merry "good-night," three little boys who lived in the country went up to bed, their minds full of Christmas trees, Santa Claus, presents, and "lots of candy."

All at once mamma heard a little voice call out, "Say, boys, let's have a pillow fight. Santa Claus wouldn't think that was naughty, would he?" "Yes, indeed he would," called up mamma. "Go right to bed quick and be good boys."

So in a few moments all was still in their room, each boy sound asleep in a neat little bed of his own.

The next morning they were up early, and it seemed a long time to wait till after breakfast for Santa Claus to come. Every now and then a little boy would creep up to the parlor door (for they saw mamma go in and heard her lock the door) and call out, "Mamma, I want to come in."

She called back, "Not now, dear."

"What are you doing, mamma?"

"I'm sitting in a rocking-chair by the fire."

"I shouldn't think you could see to do anything with all the window-shades down."

"How do you know the shades are down?"

"Cause we went round and looked; we didn't peek in, 'cause we couldn't."

"Where is aunty?" calls out a merry little voice.

"I saw her in the kitchen awhile ago," answers mamma.

So off the boys ran to hunt up aunty, and all was still for a few moments, when little hands again tried the door, and finding it still locked, one of the boys called out:

"Aunty isn't in the kitchen, but the fried chicken for breakfast smells awful good."

Mamma took the hint and said: "Well, dear, you can tell Chin to put the breakfast on the table, and I will soon be there."

After breakfast everybody went to the parlor. The door was still locked, but all at once it opened, and such a pretty sight as the room was! All the pictures were trimmed with Christmas greens and all around the doors and windows, giving the room such a sweet, "woody" smell. But the most beautiful of all was a tall Christmas tree standing in the middle of the room and hanging full of all sorts of things. The window-shades were still down, so the many candles on the tree gave it a very bright appearance and threw a soft light all over the room.

The children exclaimed: "Oh! isn't it

pretty! Is there snow on it, and what is it shines so?" (Flour had been dusted over the tree, then "diamond powder" lightly shaken on, so it really looked like snow sparkling in the candle-light.)

The boys were clapping their hands with delight, when all at once they heard some one outside call, "Merry Christmas to all!" Then came a very loud knock on the door. One of the boys ran to open it, and there stood—who do you think? Why, just Santa Claus!

They invited him in, you may be sure, and wanted to know how he knew the way to their house.

"I always know where good boys live," he said. He wasn't very tall, but was so fat he

sorts of things that boys like—too many things to tell them all.

It didn't take them long to find a way to open the funny little bags Santa Claus handed them, and much to their delight found them full of "sweets." Everybody had an egg; some were yellow, some red, some blue.

"What are they for?" called the boys.

Santa Claus took one and found a little hole on one end, covered with blue paper. He said there must be something inside, so stuck his finger in and broke the paper; then he shook the egg and out dropped a piece of paper. He opened it and found a proverb on it. Every one looked at theirs, and sure enough there was a proverb on each one.

BREA

gone. Where he went, I am sure I don't know. He couldn't have gone up the chimney, for you see there is a blazing fire; never mind, you can each eat your tart, have a fine time all day with your presents.

They were busy, indeed, had so many toys, books, etc. They carried their prettily decorated eggs to mamma, and she read the proverbs for them. One was: "My son, be wise and make my heart glad;" the other, "Bow down thine ear and hear the words of the wise;" and the other one was "Even a child is known by his doings whether his work is pure and whether it be right."

"Now, mamma, we want to see what yours is," So she opened her egg, which was the prettiest of all, and they said: "It ought to be, 'cause its mamma's."

She unfolded the paper and read: "Her children rise up and call her blessed."

They all thought it was very good of Santa Claus to give them such nice messages, and all the better because they were "really and truly true."

Well, at last dinner-time, and aunty joined them. They all told her how jolly Santa Claus was; and one said: "We are awful sorry you didn't see him, aunty. He was big and fat, but his voice wasn't as big as we would have thought it would be. Sometimes it sounded just like yours. He left some nice presents for you, and told us to give them to you. Come in the parlor and see them."

Aunty followed them to the parlor, and was much pleased with her nice presents. She kept sneezing and blowing her nose, and said: "You see, boys, I couldn't possibly have come out to see Santa Claus with this dreadful cold, but it is too bad I missed all the fun."

When night came papa lit the candles on the tree again, and took off the little gilt bird-cages and things that had helped to make it pretty, and gave the boys the strings of peanuts and popcorn, and by eight o'clock three very tired, sleepy boys went up stairs to bed, well pleased with their Christmas-tree presents, Santa Claus and all. After they had gone up, one leaned over the banister and shouted down: "Aunty, we are awful sorry you didn't see Santa Claus. Do you think he will ever come again?"

"Yes, I guess so, dear," said aunty, "if you are good boys. Now go to bed and to sleep, and perhaps you will see him again to-night in Dreamland."

Royal Discipline.

The sons of kings and emperors, when in the army or navy, are expected to obey orders like common soldiers or sailors. They have no choice between obedience and punishment. The following is a striking case:

The Russian Emperor's third son, Alexis, is in the naval service. Somewhat more than a year ago, when holding the rank of midshipman, the flagship in which he was serving was wrecked on the coast of Denmark. The admiral ordered the life-boat to be lowered, and directed Alexis to take charge of the first boat. The royal midshipman declined to obey. It was peremptorily repeated:

"I, your commanding officer, order you into the boat."

"Admiral, I cannot obey you," replied the young prince. "It would not become the son of the emperor to be the first to leave the ship. I shall remain with you to the last."

"But I shall put you under arrest for disobedience of orders as soon as circumstances will allow me to do so."

"I mean no disobedience, but I cannot obey," rejoined the youthful hero.

In due time, almost the entire crew reached the shore in safety, only some four or five having perished in the transit from the ship. Among the last to land were the admiral and the Grand Duke Alexis.

Tents were hastily erected from the sails and spars of the ship saved from the wreck, and the rigid discipline of ship life was promptly resumed. The young prince was placed under arrest for his previous disobedience of orders.

As soon as possible, the Russian minister, at Copenhagen, was informed of the facts, and telegraphed them to the emperor, from whom he received the following reply:

"I approve the act of the admiral in placing the midshipman under arrest for disobeying orders, and I bless and kiss my son for disobeying them."—Good Cheer.

AFTER SANTA CLAUS' VISIT.

could hardly get in the door; had long gray hair—that is, longer than most men wear their hair—and a full gray beard. His eyebrows were very black, and his cheeks and nose very red. He had on a long overcoat and big top boots. He laughed when the boys stared at him, and was very jolly.

"Is all the family here? Shall I take the presents from the tree now?" he said.

"Yes!" "Yes!" shouted the boys; then they looked around to see if everybody in the house was in the room, and soon said: "No; aunty isn't here."

"Well, go call her in just a minute," said Santa Claus.

In a few moments they came back, holding a card, and said: "Her door is locked, and we found this card pinned on the door. What is on it, mamma?"

She took the card and read:

"If Santa Claus comes, tell him I am very sorry not to see him, but have a bad cold, and no one must disturb me. I will try to join you at dinner."

The boys felt sorry not to have aunty see the fun, for they loved her very much, but Santa Claus began to take off the gifts and they were so busy looking at theirs that they soon forgot whether aunty was there or not. They had all

Well, by this time the tree was nearly bare of pretty things. To be sure the strings of peanuts and popcorn were still on, and lots of little gilt things, but Santa Claus said he couldn't stop to take those off. "The room is too warm for me with this overcoat on," said he.

"Take it off, and stay to dinner with us," said papa.

"No, thank you," he replied. "I only stay in a house long enough to take the things off the tree. You know there are so many little boys and girls for me to make happy to-day, but I'm very hungry. Have you had your breakfast, boys?"

"Yes, Santa Claus; but if you are hungry, we can get you something to eat. There are some tarts in the pantry that are awful good."

"All right," said Santa Claus, "I'm very fond of tarts. Run quick and get me some," so off the boys ran as fast as they could scamper, and called to Chin to give them some tarts for Santa Claus.

He gave them each one and back they ran to the parlor, calling, "Here, Santa Claus, here are the tarts for you," but much to their disappointment, no Santa Claus was to be seen.

"Where has he gone?" cried the boys.

"Why, my dears," said papa, "I saw you run out, and when I turned, Santa Claus had

The Week.

Everything gives way this week to the Christmas idea and activities. Trains leading to San Francisco have been thronged with rural and suburban people intent upon the toy shops of the metropolis and other places where gifts better suited to adult tastes can be selected. City people, too, have made good use of the beautiful weather, and have poured out their money for Christmas material as never before. One visiting the retail marts of the city might think there are enough people in California already without welcoming the thousands who are arriving and laying plans for thousands more. It has been a gala time for the shopkeepers, and the children will profit by it as well as they. Both can well afford to pass resolutions of thanks to the weather clerk, for the dry, sunny days are most important factors in the joint enterprise.

This week's *RURAL* bears the Christmas imprint upon it and will, we trust, carry to the homes of our friends assurance of our interest in their holiday joys. We hope all will enjoy to the full this happy season in this most happy year. Let each strive to make another happy and all will then doubly rejoice. With a thought as sincere as the words are trite, we wish all a "Merry Christmas."

THE LAST SPIKE.—The last spike on the railway from California to Oregon was duly driven on Saturday, Dec. 17, and the excursion to Portland which followed was a success in every particular.

Merry Christmas.

With each passing year this day dawns more gloriously than ever before, for the Song of the Angels is becoming more and more understood. Under the arctic influence of Puritanism, which hated all merriment, this day lay neglected for a hundred years or more. It was always dear in Germany, but in the dissenting regions of Great Britain and in our Colonial times, Christmas was a day partly wicked and largely stupid. But as religion became more imbued with the spirit of love, the church became ready to find more happy days in the year. Days of gloom fell into neglect; days of happiness came into new popularity. Thanksgiving has quite superseded the days of fasting and prayer. The floral emblems we see in special profusion in the churches at Christmas and Easter festivals show that religion has passed into a more genial and tropical climate. It has ceased to throw stones and prefers to gather the sweet lilies. It now finds in flowers, evergreens and music its most appreciative voice and litany. And one result has been that from year to year there is poured into the holiday sermons more of the spirit that laughs, sings and makes merry.

Christmas above all other days is the festival of unselfishness. More than any other day the hearts of the people are stirred by the angel song of peace and good-will. For the most part, those who observe other holidays propose to have a good time, to enjoy themselves, but the true spirit of this day is in helping some one else to have a good time. It is to all, old and young, rich and poor, the happy season of giving and receiving gifts, made more fragrant and beautiful by the thought of love that goes with them. It is a pleasant spectacle the country presents a few days before Christmas, when the bulk of the adult population through the streets purchasing gifts and keepsakes. The President quits work and goes shopping with his wife. Congress adjourns and grave senators and distinguished members forget their bills, committee work, and turn their attention to gift-making. The white flag hangs all along the line of party debate, and the North and the South shake hands. Even capital and labor, wealth and poverty, cease to show their teeth. In short, everybody is happy or tries to be, and the business of the day consists in devising pleasant surprises for children, relatives and friends. More than that, this day is the rift in the cloud that gives to every man or woman, however bowed down with cares and burdens of life, a glimpse of the blue sky. It would be a strange Christmas that failed to send a ray of human sunshine to every heart.

Let us be thankful this is so. Life is full enough of cares and sorrows at best. Happy they who, even for a few fleeting moments, can dream and idealize, recall sweet memories, and revel in rosy hopes. It is good for us all to have a season when we forget toil, strife, and ambition, and money-getting and the despotism of fashion, and yield to the sweet influence of nobler and better sentiments. Perhaps at no period in the world's history was the inspiration of a festival like Christmas more needed. This unceasing rush of modern life threatens to play havoc with our better nature. Already the words "A Merry Christmas" have a strange, hollow sound. The American people especially are a sad, nervous race, upon whom work has fallen as a pall, and to whom the joyousness of the heart is almost unknown. In fact, we are so far gone that we hardly know how to celebrate properly the few holidays we have.

Let us cherish our holidays and make them seasons of rest, joy, and pleasant reminiscences. Especially should we remember Christmas, with its religious suggestions, its lessons of charity and brotherhood, its memories of the long ago, its prophecies of the good time coming, when the human race, panting and footsore, will at last reach the goal of happiness. Such thoughts as these may sweeten the asperities of life and restore the fading picture of innocence and ideal blessedness. Coming as Christmas does near the close of the year, when we are about to post the books of our failures and successes, it may serve to remind us that wealth or position is not all of life, and that both combined may prove a curse if not accompanied by the happiness that is the fragrant flower of duty alone. In this spirit we wish all our readers, friends and patrons, and enemies, if we have any, a Merry Christmas.

The Eastern Horticulturists.

We have a note from W. H. Ragan, secretary of the American Horticultural society, stating that existing railroad rates make it necessary for the excursion of horticulturists to come first to the upper part of the state instead of to southern California, as announced before. This fact will enable the excursionists to accept the invitation of the San Jose Horticultural society as well as the invitation to Riverside, and that, consequently, the annual meeting of the American society "will be held in two sections, viz.: commencing in San Jose, on Tuesday, January 24, and continuing for two or three days, considering topics most important in that section, and reassembling at Riverside February 7, for a similar length of time, to be devoted to topics of greatest interest in southern California. This arrangement, without additional railroad expense, will enable our people to visit almost the whole of the exceedingly interesting state of California." This is the way in which the note from Secretary Ragan expresses it. He also states that from the interest manifested in the excursion there will come to California a large delegation of representative horticulturists and promises full particulars soon.

In recognition of the visit of the excursion to San Jose, the Central California Citrus Fair will open in Horticultural hall in that city on January 24th and continue until March 2d. We acknowledge receipt of a complimentary thereto from Hon. Cyrus Jones, president. There is every reason to expect that our San Jose friends will put forth unusual efforts in view of the coming of the Eastern horticulturists, and that there will be a most notable display. It is under consideration to entertain the Eastern visitors during their stay in the homes of the citizens, which would certainly be a most hospitable act.

Affairs relating to the Southern California Citrus Fair at Riverside, February 7th, seem to be progressing favorably. At a meeting of the San Bernardino Board of Trade last week, a committee was appointed to urge all the thriving settlements of San Bernardino county to take part in the fair at Riverside. We trust full co-operation will be secured not only in San Bernardino county but elsewhere, and that our guests will return with a true idea of California's resources and advantages.

Our Public Lands.

The annual report of R. P. Hammond, United States Surveyor-General for California, for the fiscal year ending June 30th, shows that during the year there were received 138 applications for surveys of mining claims, 80 applications for examinations and reports upon placer claims under General Land Office circular approved September 23, 1882, and 72 applications for surveys of the public lands. The report shows that the expenses of the office have been decreased from \$60,571 in 1882-83 to \$31,839.06 in 1886-87. The Surveyor-General calls attention to the fact that the immigration in the past year has been unprecedented. The permanent population has increased so rapidly that it is almost impossible to state accurately the addition. He believes, however, that the population of California is fully 1,200,000, as against 864,686, as shown by the last official census. Petitions are constantly being received asking for surveys. Owing to the meager rates allowed by Congress, it is almost impossible to get a competent surveyor who will make the surveys that are authorized and do the work conscientiously. The Surveyor-General suggests that Congress should be asked to appropriate at least \$75,000 for the survey of land in California for the next fiscal year, and he believes that every acre so surveyed will be settled upon and purchased from the Government as soon as placed upon the market; thus the amount appropriated will soon be returned to the treasury of the Government.

The finest strawberries of the year continue to be brought into the Petaluma market twice a week from a farm on Sonoma mountain, and which is in a warm belt that extends along that mountain for about fifteen miles.

CO-OPERATION.—Senator Stanford reintroduces in this Congress his bill to foster and promote co-operation, which was before the last session, and was described in our columns at the time.

Ramie.

There is a project under consideration in this city to form a corporation for the manufacture and placing on the market the ramie fiber. It is proposed that the company shall have sufficient capital to warrant farmers and land-owners in growing the plant in large quantities.

Experiments that have been already made in several parts of the State prove that the plant will grow luxuriantly with the smallest amount of care and cultivation. The conditions being a suitable soil of sandy nature, holding a great deal of moisture. On such soil two or even three crops annually can be grown. The plant is perennial and highly productive, and probably will not require replanting more than once in ten years. The cost of gathering the crop is very small, less than for any other marketable product. Should the projected company be formed and the fiber be properly manipulated, it is estimated that in a few years suitable land planted with ramie will yield an income of \$200 per acre annually, though, of course, things are liable to occur to interfere with all such estimates.

Fabrics made of ramie will compare favorably with silk for fineness, and surpasses that staple for durability. It can also be substituted for both wool and cotton.

Most attempts made hitherto in this State to manipulate the fiber have failed on account of the difficulty of separating the gum from it without destroying its texture. One of the promoters of the present project claims to have demonstrated that the difficulty has been overcome. He claims that with proper financial support he can place the ramie fiber on the market at a profit that will prove amply satisfactory to investors, thus adding another highly profitable and substantial industry to our steadily advancing State.

Courts of Conciliation.

There is a movement in some of the Eastern States toward giving legislative sanction to "Courts of Conciliation," or neighborhood tribunals for settling disputes without a regular lawsuit. It is thought that well-devised statutes authorizing this method of adjusting differences between citizens will obviate a deal of litigation.

This plan has been long and thoroughly tried in Denmark, and with remarkably gratifying success. The *N. Y. Evening Post* thus describes the functions and achievements of the Danish Courts of Conciliation:

Each local community is authorized to choose a tribunal called by this name, which consists generally of one judge and two assistants, selected with reference to their high standing in the public confidence and their qualifications for composing disputes. This tribunal has jurisdiction of every complaint upon which a civil action might be based, and no such action can be heard in any regular court until it has been laid before the Court of Conciliation and has resulted in a disagreement, so that every cause out of which an action might arise, except in criminal cases, comes first before this tribunal. The principals appear in person to tell their stories; witnesses are called in if necessary, but no counsel are allowed, and if the decision is accepted by both parties, the dispute is ended, lawyers' fees are saved, while the judgment has the same force as a judgment of an ordinary court. That the decisions are accepted in the bulk of cases appears from the fact that during the first five years of the system 116,483 cases were brought before the "Courts of Conciliation," of which 74,742 were there settled, and during the next five years 190,836, of which 121,970 were settled and only half of the remainder were ever carried to actual litigation.

This is a grand subject for Christmas week when "good will to men" is one of the sentiments underlying the dispensation. The subject is one of the greatest importance socially, sentimentally, economically and generally. Just think of the heartburning and hates, the loss of individual savings and industry, the immense expense to the public, which result from the operations of the courts in civil cases alone. Conciliation or arbitration should take the place of formal judicial proceedings, where contestants are by all the surroundings held up to the bitter end of their controversy. It would seem but a proper outcome of our progress in civilization that some better way should be devised to settle troubles which are often but misunderstandings at first but grow to be most deep-seated quarrels. Conciliation is a good word. It is infinitely better than litigation.

The Olive in California.

[Especially Reported for the PACIFIC RURAL PRESS.]

The olive is just now a most popular fruit in California. Long ago all available rooted trees were engaged from our nurseries, and the desire to plant olives amounts almost to a passion. We cannot better minister to the great popular demand for information on the subject than to present a full report of the olive discussion at the Santa Rosa convention, which was one of the most interesting of the week. It was led by Mr. Ellwood Cooper of Santa Barbara, President of the State Board of Horticulture, who is our best-known olive-grower.

Essay by Mr. Cooper.

Those wishing to embark in olive growing I refer to my essay read before the Fruit-Growers' Convention held at Sacramento, Nov. 1885. Published in the Biennial Report, pages 327 to 331 inclusive. [This report can be had free on application to B. M. Lelong, secretary State Board of Horticulture, at the office, 220 Sutter St., S. F.]

Concerning propagation, I recommended planting 20 feet distant each way. I still conform to this plan, but I have found it necessary after about 15 years' growth, to remove every other diagonal row. This will give the trees a distance of 28½ feet. The closer planting will pay to do this.

To what I said on diseases (on page 330) I would add that the only trouble we have had thus far is the black scale. The remedy I have adopted will be found on page 36 of the report. On the subject of olive culture generally, I refer to pages 13 and 417 to 424, inclusive, 517 to 534, inclusive. This latter article was written by F. Pohndorff, who has published a memoir on the subject with various illustrations. The book is on sale in San Francisco. Adolf Flamant has also published a pamphlet with various illustrations, to be had at Louis Gregoire & Co., 6 Post street, San Francisco (or can be furnished by Dewey & Co., publishers RURAL PRESS, at \$1 per copy.) These two pamphlets are mostly translations from European works. I make this observation with regard to varieties and names, that so far as my experience goes no two authors in the French, Spanish and Italian works agree as to names, so that without further knowledge than the mere translations no reliance can be placed in them.

The Mission olive, the one I have propagated, is a rapid grower, well adapted to our climate, well grown in almost any kind of soil if well drained.

The tree is easily shaped. The berries make good oil; the fact is, I defy the world to excel mine. The quantity of oil that I have made from one acre exceeds the statistics given in the various tables. The variety called Picholine, which is being grown in various parts of the State, I know nothing about. It is only after a test is made that its merits can be known fully.

I would recommend to all those who now begin the business, to get a few trees of as many varieties as possible, so as to determine in the near future what will be the most profitable to plant. The olive will thrive and do well in almost every part of California, and while there may be fruits that will yield better incomes, no tree offers so much and so certain as a permanent investment. Oil-making cannot be overdone. The demand for good olive oil at good prices must increase more rapidly than the production. But those who embark in the business must remember that no trees require greater care to insure profits, and, as to oil-making, a fine grade can only result from knowledge and extreme care.

In olive-growing we are independent of high-priced labor, the picking being done in the winter time after all other fruits are gathered. We are, comparatively speaking, independent of the freight question, as the value is great in small bulk. The fruit is not perishable.

I expected to add to these notes, as Doctor Agard of Auburn promised to give me the different bearing qualities of the Mission and the Picholine, as he has them growing of the same age in the same orchard at his place. I have not heard from him, and therefore cannot speak as to the quantity of berries on trees side by side of the same age, nor as to the time of ripening. Some claim that the Picholini ripens earlier. If that be the fact, and in other respects equal for all purposes, there would be an advantage of propagating the Picholini; but so far as I have been able to learn, where the two varieties are grown in the same neighborhood there has been no difference.

I have visited since being in Santa Rosa the hills of Captain Grosse of this place, where he has probably five or six thousand trees two years old from planting, and I must say that Captain Grosse deserves great credit. He has conferred a lasting boon on the people of Santa Rosa, clearing land that to my eyes was absolutely worthless and planting olive trees. These olive trees on the ridge of the hill are probably not more than from five to ten rows wide, following the shape of the hill, and in that respect there will be a great advantage in regard to insect pests, because they will have better circulation of air and more sunlight, and on that account there will be much less danger of insect pests. I have growing on my place olive trees in the black adobe, in deep bottom land, in sandy land made from the wash of the mountains, in stony hill-sides and adobe hill-

sides, and in table land, where the sub-soil is probably 20 feet deep, dark clay, and so far as I have known there is no difference in the bearing of these trees or in the oil made. At the same time I do not recommend planting any kind of trees where there is a deep clay sub-soil, for it is doubtful if all trees will do so well in such soil.

Yield of the Olive.

The only test that I ever made in regard to the quantities borne by an orchard (that is, taking all the trees), showed 122 pounds of olives per tree throughout the orchard—large trees and small trees seven years old from the cutting—122 pounds of olives from trees seven years from the cutting. The best results in making oil has been 10.55 pounds in one large bottle of oil. The poorest result was 12½ pounds. I could not say whether it was caused by the different years or by less care in drying. We dried these olives altogether by artificial heat, and possibly the best result was because I gave the drying my own special attention. But we have for the tree seven years old at least ten bottles of oil, and those bottles will sell readily anywhere and everywhere at a dollar a piece. I was compelled to put the price up to \$2, \$24 a case, to keep my customers from quarreling about it, and I am sorry to say they quarrel all the same. I ought to have put it at \$5 or \$10, so it would have been a question of money, but I did not wish to do that, and as soon as I shall have a large enough crop I shall put the price at \$12 a case—\$1 for a large bottle of oil—and that is profit enough for an olive orchard.

Oil-Making.

Mr. Gray: How much do you dry the fruit? Mr. Cooper: We judge more by the feeling than by any other mode of test. The olive in picking must be picked with care so as not to break the skin, and in drying at a heat over 120° F. It requires 24 hours, and, by putting the hand in among the olives, you see they all feel greasy, and in squeezing they are more or less spongy—a sufficient amount of water has evaporated to allow the liberation of the oil. They have practiced this method since the time of Genesis, that is when olive-making is first mentioned. In the earliest history of the race they never attempted to make oil without drying the berries—at least there is no record of it. I have never made the attempt, and I doubt whether olive oil can be extracted from the berries without first drying them to evaporate portions of the water. A good deal more heat is required in the early part of the season than later in the spring. We commence picking in December, as soon as the olives turn a purple color, some of them probably only a reddish color—one side partially green—but they are ripe enough for making oil. They require more drying then than in the months of March and April, when the water will have evaporated mostly from the tree when they are hanging from the limb. That, of course, has to be governed by an intelligent person managing the drying. It is supposed that the oil is of a lighter color made earlier than it is later in the season, but, as we make it all in the same tank, I do not apprehend that there is very much difference as to the color of the oil, neither the quality. In Europe they dry the berries almost altogether in the sunlight. In the coast counties here that is impossible, because we may have a series of foggy days during the process of drying, and then it would be impossible to carry on the work.

Pruning.

A Delegate: At what age do you commence pruning?

Mr. Cooper: We commence pruning in the second or third year. In planting a cutting it is better not to disturb any limbs or branches that grow, because cutting when the tree is young interferes with the roots, and you will understand that if you cut away the limbs, destroy the leaves, you are destroying the breathing apparatus of the tree, destroying the root. An untrimmed olive tree, when small and commencing to root, will grow four times as fast without pruning as if you prune it. The more top it has the faster it will grow. It feeds very largely from the leaves, from moisture. After the second year, though, you want to prune. Those that cultivate the limb up to 5½ or 6 feet must, of course, pinch off all the branches that are making wood rapidly, so as to force the strength into one main trunk, and where lateral limbs branch out, pinch them off at the end and stop the growth in that limb. But all small branches should be left alone as much as possible until the tree gets eight or ten feet high, and then commence cutting them off until you get up to 5½ or 6 feet. Those who want to prune low, can start out from four to five and six inches from the ground, and from four or five trees instead of one. I am not in favor of low pruning of the olive trees in the coast counties. We have no fear of sunlight burning the bark, and in ten years you can get twice as much tree with high pruning as you can with low pruning. It grows up to a bush more than a tree, and these shoots vie with each other to get up to the sunlight, while if you pinch them up to four or five feet you can form a tree much better.

Dr. Kimball: Does the tree sunburn?

Mr. Cooper: I never saw an olive tree sunburn. I have not seen it in the hot valleys where the thermometer is 110° in the shade during the summer.

Mr. Woolsey: Have you ever found anything besides the black scale on the olive?

Mr. Cooper: I never have. There are a

number of insects mentioned in the French books, but I have never seen them in California to my knowledge.

Mr. Woolsey: We have an olive tree in our garden, and a very beautiful one, and I found that it was bored thoroughly with the twig-boring beetle. I never found them so thick in the pear as I have in the olive.

Mr. Cooper: That was probably the oak-borer, and likely the surrounding oaks were burnt off and they had been driven down to the olive tree.

Mr. Tompkins: Do you thin out the head of the olive tree at all to let the sun in?

Mr. Cooper: It is not necessary in California. The olive tree is a very rapid grower, and in pruning you have to do exactly the opposite. The theory of lopping off the perpendicular branches, as advocated in the French books by all the authors, so as to allow the lower limbs to bend out and give sunlight to the interior of the tree, is not needed in California. These limbs would all overbear so that they would break off, and while the tree is rapidly growing, the outside branches, as soon as they would get full of fruit, would bend out and touch the ground if you didn't prop them up. There is no necessity of inside pruning in a small tree.

A Delegate: Does the tree overbear?

Mr. Cooper: The tree overbears in some years.

A Delegate: Is thinning practicable? Have you thinned at all?

Mr. Cooper: No, I never have. I have endeavored to cut them so as to save the fruit and make just as much oil as possible.

Mr. Gray: Can you give a description of your present crushing process?

Mr. Cooper: It is described in the bi-annual report. I have adopted for the last two years the same method that is used in Europe pretty generally, except that I have cast-iron rollers that travel around in the trough instead of stones, connected by a horse and a shaft inside, with cog wheels on to turn it around, and we put the dried olives in this trough, four or five sacks at a time, and these rollers pass around one after the other—there are two rollers in the same trough—until it is in a condition and looks as much like blackberry jam as anything else that I can describe. Then we take it from that trough in that state and put it into cloths, and we double them over and put slats of wood in between each cheese so as to make aqueducts for the oil to run out. We pile them up five or six, or eight or ten, one on top of the other, and put them into the press and run the oil into the tub. From those tubs it is run into the tanks and there it has to settle about four months. The oil, being lighter, rises to the top, and we draw it off from the top.

A Delegate: Do you crush the seed or do you guard against it?

Mr. Cooper: You cannot crush the pulp properly without crushing the seed. I had some seeds sent to a competent chemist, one who is connected with the largest establishment in Philadelphia, and who is also a friend of mine, to test. He found nothing in the seed that could do any possible injury to the oil. In the olives that I have, there is not one seed in 50 or 100 probably, that has any kernel; the kernel is supposed to be mostly Prussic acid, and much of that got into the oil would injure it.

Size of Cuttings, Etc.

A Delegate: What size would you recommend planting the cuttings?

Mr. Cooper: We plant them about 14 inches long, from 1 inch in diameter up to 2½ inches. We also make cuttings three-quarters to one inch. These cuttings we plant in the field where the tree is to grow permanently. We plant diagonally; that is, the top to the north to keep the sunlight, as much as possible, from cracking open the limb that is exposed. We put the cuttings about 10 inches deep at the foot.

A Delegate: Do you saw off the cuttings?

Mr. Cooper: We saw the cuttings off with a sharp saw so as not to injure them. Some have painted or waxed the top, which is a very good plan, though I never did. We take the cutting off as soon as we have picked the fruit.

A Delegate: At what age would you transplant from the nursery?

Mr. Cooper: Well, my transplanting of small trees has not been very successful, probably from want of care. The trees I plant out from growing in the nursery are as thick around as a chair leg—say an inch in diameter—and some of them are 10 feet high. The olive tree that I am going to move in the spring I trim off like a cane four feet high, leaving nothing but a stalk, and those that have a good root are sure to grow.

A Delegate: How far apart do you plant in the nursery?

Mr. Cooper: Just room enough—say six or eight inches apart, and the rows five or six feet apart—so that you can work them with a horse. In the nursery we work them every week or two. They require the same care as to grow any vegetable.

A Delegate: Do you irrigate?

Mr. Cooper: I never irrigated. I recommend, however, in planting cuttings out on high land, that they had better be watered twice during the season, and the water can be carried in a wagon. I would give them about 20 gallons. Generally, when I have watered cuttings I give about 10 gallons at a time to each cutting and water them twice. Captain Grosse says he has not watered his, but they are all rooted plants.

Mr. McDonald: Do you think Grosse's will do well without irrigation?

Mr. Cooper: I think they will. Those are growing amongst rock; the rocks are so thick that there is no chance for any weeds to grow in between. If the ground were tillable we might have mustard, tar-weed, and nightshade, and everything else to kill the olives out, but there amongst the rocks he has the advantage of all these weeds.

A Delegate: Is a cutting an inch in diameter more desirable than one a quarter of an inch?

Mr. Cooper: Yes sir, nurserymen will prefer an inch to any other size—an inch to an inch and a quarter to an inch and a half.

A Delegate: What percentage die of yours?

Mr. Cooper: I planted out an orchard last winter of over 20 acres, and I think there are not 20 that are not growing nicely—that is, cuttings set in right from the tree.

A Delegate: Did you water them before they started?

Mr. Cooper: We watered about the time the ground needed it, without paying any attention to the growth. Some of them had started and some of them had not. I had cuttings planted out in March that are four feet high.

A Delegate: You advise rooting in permanent rows rather than putting in nursery rows?

Mr. Cooper: No, sir; I do not advise it. It is more convenient for me to do it. I plant some in the field and some in the nursery; and where they failed to grow in the field I substituted trees the following year. It is a very good thing to plant in the field after you have the ground carefully prepared. Plant the cuttings out in the permanent place, and plant a number in the nursery, taking good care of them, to make trees to plant where the others fail, and then you have an orchard that is pretty nearly the same size.

A Delegate: How much preparation was made in this orchard here in Santa Rosa that you have spoken of?

Mr. Cooper: The preparation here was very great. It was all grown up with bushes and shrubs and trees, which were all dug up and dug out by the roots. No better preparation of the soil could be made than that, because it was all completely thrown up.

A Delegate: And plowed?

Mr. Cooper: No possibility of a horse getting in there, it was too rocky. It was dug over very thoroughly and most of the grass killed. In some places, where there were little plateaus and where there was very little rock, the fields were plowed. If this experiment proves a success it will demonstrate that there are thousands of acres here on the hills, now supposed to be worth nothing for any purpose, that can be used for olive culture.

Conclusion.

[We shall finish the interesting discussion in a future issue of this RURAL PRESS.]

AMERICAN FLOUR IN EUROPE.—American flour is now in sharp competition with European millers, and already has an established preference in some of the principal foreign markets, mainly due to the improved roller process used in its manufacture. The decrease in exports of wheat is thus compensated for in no small degree, considering the advantage arising from the shipment of manufactured material. Aside from the superior quality claimed by the American miller, he is more successful in the competition by reason of the flouring-mills being located generally near to the grain-producing regions, whereas the European manufacturer must, as a rule, transport his grain long distances, together with the 25 or 30 per cent of bran, which the American miller saves. On contemplating the situation the conclusion is reached that the United States may possibly have secured permanently the control of the European flour market, or at least until such time as may be required to establish mills equal to American in the great wheat-producing countries of India, Australia and South America, together with cheap transportation by land and sea.

RUSSIAN SUNFLOWERS.—The Visalia Times advises farmers who live at a distance from the timber belt, and have to haul their firewood, to cultivate a half-acre of Russian sunflowers. They grow to a height of eight or ten feet and a diameter of from two to four inches. The stalks, when dry, make excellent fuel for kitchen use, and the seeds are valuable as chicken feed.

PASTEURIZING THE AUSTRALIAN RABBITS.—It is said that Pasteur proposes to kill off the rabbits in New Zealand and New South Wales by turning loose among them a few of their own species inoculated with the microbes of chicken cholera, which, he claims, will breed so much faster than even the prolific rodents that the latter will soon be exterminated.

THERE is not hay and grain enough in the south end of Owens valley to supply the local demand.

HOLIDAY READING.

"Old Mines."

Christmas Eve Spent in a Lead Mine.

Written for the RURAL PRESS by FANNIE ISABEL SHER-
RICKS.]

"Old Mines" the town was called.

There had been mines there in the old French days when St. Genevieve and Potosi had been the foremost settlements in Missouri, and St. Louis only a trading-post, but now things had changed and the name was merely a name with only a few dismantled, weed grown mines to prove its early appropriateness.

Courtesy called the main road leading past the old-fashioned cottages a street, though only one store might be discovered wherein all the trading in the vicinity was done. The shelves showed a rather mixed assembly of dry-goods, chinaware, stationary, groceries, etc., such as is usually found in the country store, over which the benign clerk presided with becoming dignity and satisfaction to all his patrons.

The settlement could not be called either gay or populous by any means, but it was picturesque and pretty, and the residents were in no wise as quiet and unpretentious as the drowsy monotony seemed to indicate.

"Anyhow the house is delightful," cried Lutie, with her usual enthusiasm, growing quite extravagant in her praises of the long, rambling Southern home with its broad piazzas and sloping roofs.

"It's just beautiful!" echoed her Aunt Nora, who, by the way was only a year or two the senior of her pretty niece, dropping into the capacious easy chair with a sigh of content, "I'm so glad we came."

"Now, my dears," said Mrs. Block, a distant relation whom they had come to visit, in her gentle, motherly way, "take off your wraps, and when you're rested I'll take you to your room; and here comes Ed—just in time, my dear, to make the acquaintance of your cousins, at least we'll call them so by courtesy."

He stood in the entry twirling his hat in an embarrassed way for a moment, then he came forward, shaking each by the hand warmly, his fair face flushing a little under the curious gaze of two pretty girls.

He was a fine-looking young fellow, with a pair of frank blue eyes. Lutie decided immediately that she would like him, while Nora looked at him a little thoughtfully, not being given to "first impressions."

After a little chat the girls were conducted by Aunt Margaret to the spare chamber, a cozy place upstairs beneath the eaves, with low windows looking out over a pleasant stretch of country now covered with snow; they were hung with curtains that were the very whitest in the world, and looped back with dainty blue ribbons. The whole room had that indescribable air of inviting hospitality, and that sweet, fresh scent that can only be found in the spare chambers of country houses.

"The whole place is just sweet enough to eat!" declared Lutie, when they had changed their traveling suits for fresh woolen dresses, and made themselves as pretty as possible. There was not an article in the room that escaped the quick scrutiny of her brown eyes, and she admired all of the dainty mats and the prettily worked tidies with an artistic enthusiasm.

Aunt Margaret presided at the tea-table with a dignified grace that well became her gentle, placid face, crowned with the rich brown hair already tinged with silver.

After the first embarrassment was over Ed appeared to great advantage, assisting his mother dextrously in serving her guests, and keeping up a round of sallies with Lutie and Nora, much enjoyed by Dinah, who "clared to goodness" from her standpoint in the kitchen, that "them ere gals were jes' the peartest and sweetestest" that she had ever seen.

Tea over, they adjourned to the big parlor, where a blazing fire of huge logs was roaring

in the great old-fashioned fireplace. The girls were standing in the glow of the firelight, looking over Ed's cabinet, when a caller was announced.

Frank Curtis was as dark as Ed was fair. He had evidently seen more of the world, and did not lose his self-possession at any moment. He could not properly be called a society man, for he had never spent much time in fashionable life, but he was well educated, had traveled some and was possessed of a keen insight into human nature, all of which gave him a certain fascination in the eyes of innocent young ladies, rendered all the more dangerous by a latent inclination which he possessed toward flirtations. He and Ed were old chums, hav-

ing been raised together, but Frank's father possessing considerable money had sent him to college and given him several years' travel, all of which gave him a polish which he would not otherwise have received. He was a fine singer, too, which, of course, pleased the girls.

Before he left he and Ed had a long, private conference in the hall. When they came in Ed said:

"Well, we have decided to give you a real, old-fashioned frolic, Christmas eve—that is to-morrow night. The Jenkins are going away next week to the South to live. All of their carpets are up and most of the furniture packed, so the house will be just the thing for a lively dance."

"Oh, a country dance—how charming!" cried Lutie; "but will it be possible to get up a party at such short notice?"

"Yes, indeed; why, you don't know how people take hold of such a thing here. Give us an hour to-morrow morning to give them

notice, and there'll be a crowd there to-morrow night that will astonish you."

Sure enough, the next morning the boys took their horses and invited the young folks far and near, and the girls helped Mrs. Block and Dinah to make cake, so that by nightfall all was in readiness for the dance.

"You uns jes look sweet nuff to eat," said Dinah, when Lutie and Nora came down dressed in party array, with bright ribbons flowing and cheeks like roses.

Some one else must have thought so too, for he stood looking at Lutie with all his heart within his eyes. It was Ed who, with lap-robe and whip in hand stood in the doorway ready to escort the girls to the sleigh. It was Frank's

alls, on horseback and on foot, each one carrying his own lantern, with which the farmyard was now illuminated.

Inside the house all was gayety and confusion. The rooms were decorated with evergreens and hung with lanterns, candles and every conceivable style of lamp. The fiddlers were playing, and the girls and boys were making the most of the flying time, their feet keeping noisy pace with the jingle of "Money Musk" or the "Arkansaw Traveler."

The boys danced by numbers as is the fashion in such places, and when they were through they escorted the girls back to their seats on one side of the room, while they monopolized the other. The girls looked like a row of pinks as they sat in line, and I have no doubt many an awkward youth's heart thumped a little faster as he looked upon them.

Lottie and Nora were the belles of the ball, and they entered into the spirit of the occasion with great zest. Nora was a beautiful dancer, and she found Frank all that could be desired in a partner. Between the dances games were indulged in, and at midnight a big supper was laid in the great old-fashioned kitchen, where apples and nuts were roasted in a fire place almost big enough to take in a good-sized house.

The merriment ran high, but their enjoyment was soon to be marred.

At one o'clock a man came running into the farm-yard. He wanted to see Frank, whose mother had been taken suddenly ill. It was not anything serious perhaps, but she was desirous that Frank should be with her.

"I will take the sleigh," said Frank, "and send it back by the hired man as soon as he returns with the doctor." So it was agreed, and Frank was soon traveling down the road at a lively rate.

It was a dark night, the sky being overcast with clouds, only the glimmer of the snow lighting the way. Suddenly a large shadow loomed up in the road. The horses immediately reared and plunged.

"It's only a cow, you foolish creatures!" shouted Frank. But he could not calm them. They dashed to the side, almost overturning the sleigh. He leaped out, striving to head them off. But he was too late. The reins slipped from his hands, and the horses were off in a second, galloping down the road at a furious rate.

And he was—where?—he hardly knew for a second. He seemed to be slipping down and down and down, farther and farther, as if the very earth had given way beneath him. Suddenly he realized his position. He had fallen into a drift of snow that covered an old mine, and he was slowly going to the bottom. He struggled in vain to clutch at something, but he was covered with snow and blinded with darkness. It was only an instant, but it seemed to him a long time before he found himself on a solid foundation.

He lay there for a second quite thankful for the error which had saved his life. Without it he would probably have received a serious hurt. Fortunately he had matches with him, and after some difficulty succeeded in lighting one. He found on inspection that the mine was not very deep, but he might as well have been buried in a silver mine in the Rockies for all his chance of escape. His only hope was that his absence would be discovered—they would come to search for him.

But what if it had snowed again, as it had threatened to do; then his chance would be slim indeed, for all traces of his foot-tracks and fall would be obliterated. The place was honey-combed with mines; even if they felt sure he had been lost in one of them they might search for days without striking the right one.

At best it was an awkward predicament, aside from the danger, and he thought ruefully of his poor mother, the accident to him might endanger her life. If he were not found, her's would, indeed, be a sad Christmas.

Fortunately it was warmer in the mine than outside, so he was not in any immediate danger from exposure, and all he could do was to wait patiently for rescue.

And that kind providence which watches over all of us had not forgotten him.

At 3 o'clock Sam, Mrs. Curtis' hired man, came rushing into the farmhouse. He had met

HELPING MAKE THE CHRISTMAS PUDDING.

ing been raised together, but Frank's father possessing considerable money had sent him to college and given him several years' travel, all of which gave him a polish which he would not otherwise have received. He was a fine singer, too, which, of course, pleased the girls.

Before he left he and Ed had a long, private conference in the hall. When they came in Ed said:

"Well, we have decided to give you a real, old-fashioned frolic, Christmas eve—that is to-morrow night. The Jenkins are going away next week to the South to live. All of their carpets are up and most of the furniture packed, so the house will be just the thing for a lively dance."

"Oh, a country dance—how charming!" cried Lutie; "but will it be possible to get up a party at such short notice?"

"Yes, indeed; why, you don't know how people take hold of such a thing here. Give us an hour to-morrow morning to give them

team and he sat on the front seat muffled in furs and robes.

"By Jove," he said, as they went spinning down the road, "but these horses are frisky; they have not been out for a fortnight."

"Oh!" cried Nora who sat beside him, "aren't you afraid to drive them such a night?"

"No, indeed," he laughed gayly; "there isn't a bit of danger."

"Yes there is," said Ed, "and you must be careful. Have you forgotten the old lead mines are all along this road, and it would be very easy for these horses to step aside and run into one of those holes, especially now the snow has drifted over the openings."

But no such accident occurred, for Frank handled the reins superbly, and the horses, though lively, were well trained.

When they arrived at the farm house they found the whole country turned out en masse. They had come in sleighs, in wagons, in carry-

would be discovered—they would come to search for him.

But what if it had snowed again, as it had threatened to do; then his chance would be slim indeed, for all traces of his foot-tracks and fall would be obliterated. The place was honey-combed with mines; even if they felt sure he had been lost in one of them they might search for days without striking the right one.

At best it was an awkward predicament, aside from the danger, and he thought ruefully of his poor mother, the accident to him might endanger her life. If he were not found, her's would, indeed, be a sad Christmas.

Fortunately it was warmer in the mine than outside, so he was not in any immediate danger from exposure, and all he could do was to wait patiently for rescue.

And that kind providence which watches over all of us had not forgotten him.

At 3 o'clock Sam, Mrs. Curtis' hired man, came rushing into the farmhouse. He had met

the horses dashing along the road on his return from the physician's. There was a broken sleigh behind them and no one had seen Frank.

All was consternation. The party was broken up in a hurry and the men turned out in parties with their lanterns to search for the missing man. All of the girls looked bewildered and sorry, but Nora grew very pale and said nothing. She wondered why a man whom she had known only two days should have become so much to her. As if love could ever explain itself. Cupid delights in sending his shafts at random.

It was Ed's idea that Frank had fallen into one of the mines, and consequently he led the way back over the road which Frank had traveled. He looked carefully all the way for footprints, but found none. At last, however, he came to a place where the sleigh seemed to have turned. Not far from this was the impress of a man's feet and a breaking away of the snowbanks. Ed approached cautiously, feeling his way at every step.

"Boys," he said, "there's a mine here, and I believe Frank has slipped into it."

They shouted Frank's name again and again, but no response came—only the whispering of the winds answered them. But at last Frank crept to the very edge of the opening and put his ear to the ground.

"Frank!" he shouted with all his might, and his cry was responded to by a faint "halloo!"

"It is Frank's voice," he said, and immediately preparations were made for his descent with ropes and lantern.

In a little while Frank stood among them. He was a little benumbed with the cold, but otherwise unharmed, and a general rejoicing followed.

"And my mother; how is she?" he asked, when he had fully recovered his senses.

No one had thought of her. Their sole anxiety had been for Frank. As soon as possible he was put into a sleigh and driven home. He found his mother under the physician's care. She was quite ill, and was not allowed to hear of Frank's escapade until she had fully recovered.

I need not say there was a joyful Christmas the next day after Frank's unlucky adventure, and that the turkey, mince pies, and sundry other good things were relished by the young people as they had never been relished before.

Those people who expected a wedding in this story may perhaps be disappointed, but I must say, to be truthful, that Ed and Lutie grew very fond of one another, and that Frank found great happiness in gazing into a pair of bright eyes that had haunted him even in a lead mine.

(Original.) Christmas.

BY S. C. B.

The air is cold, the wind is chill,
We'll have, though, Merry Christmas, still;
The bells are ringing—hear their sound—
But not for Christmas, the year round.
Though winter, yet our park is green,
A merrier winter we've never seen,
And in the family home, this year,
Are we quite sure that "All are here"?
Is there no "vacant chair" to-day?
Perhaps 'twill not be thus away.

Brightest flowers fill room and hall,
Sweet little faces come at call.
Why should not happy hearts tonight
Welcome in this festive night?
The tree is set, the candles lit,
And baby's clapping hands are fit
For Christmas emblem—heart so light
To greet her Santa Claus tonight;
For he would be remis in duty
To not bring something for our Beauty.

Near Grandpapa (whose wistful eyes
Thinks something on the tree he spies)
Sits Grandma dear, whose special care
Has placed the tree, bid Santa there;
And Father, with his careworn face
Lights up in smiles to Mother's grace,
Reflect, with features all aglow,
Their little ones; full well to know
We "all are here"—thank God, and pray
For those who have no Christmas day.

Preparing the Christmas Dinner.

Christmas begins very early with the children. The tardy December sun is often too slow a torch bearer, and the unaccustomed gleam from many windows on a Christmas morning is a cry that the little ones are awake and searching for the footprints of Santa Claus around the hearthstone. Beginning thus early with their gifts the fleeting interests of childhood seeks new fields before the morning is half spent, and the kitchen is resonant with little voices laden with countless queries concerning the coming Christmas dinner.

Our artist has seized a view of a home where this flight to the kitchen has just occurred, and all, even to the baby, are clamorous to have some share in the preparations for the feast. The request is cheerfully granted, and little four-years-old is now enjoying his share in kitchen composition. When the dinner comes upon the table the children will surely claim their share of honor for its excellence.

Many of our young friends will see themselves portrayed in the engraving which we present. May they enjoy the day from dawn to eve.

MADAME DEMOREST was among the New York ladies who applied the other day to register in order to vote.

The Gift-Making Season.

There is no mistaking the premonitory symptoms, Christmas is nigh at hand. There is a holiday aspect on everything, and business feels the enlivening influence. There has been a great change in late years in the holiday trade. Once the poultry dealers, the groceries, toy and confectionery vendors, had pretty nearly all the business. But while these luxuries and notions have not lessened in demand, the scope of giving has greatly increased. Everything now from a house and lot to an album, from a piano to a pin-cushion, comes within the gift range of this big-hearted festival.

It is believed that the habit of making gifts at this season of the year is a beneficent feeling born of the manger and the cross. It was certainly an early flower of Christmas faith. Then the poor were fed, the ragged clothed. Even messengers were sent out to scour the by-ways, lanes and hedges, and bring in the poor, lame, halt and blind, and give them the best of the land. It was not long, however, before the circle of Christmas benefactions was greatly enlarged, and men began to make complimentary gifts to their wives and children, relatives and friends. The gift came from the heart, and was put away as a fragrant place-keeper in the book of memory. The woman who embroidered the first pair of slippers for the dear pastor, or knit purses, mittens or comforters for her husband and big boys, had no thought of gaining anything beyond the pleasure of the deed. That was the golden age of giving, but it has nearly passed away. The age of barter and exchange has come in, and there is a talk now of assigning it to our text-books on domestic economy.

On the approach of Christmas, a levy is made on the pocket of every man and woman in the country, and though by a fiction of the imagination it is regarded as voluntary, it is really as inexorable as the assessments levied on candidates during a political campaign. The steady increase in the value of Christmas gifts is a fact full of alarming significance. A man with a big family is often compelled to skate near the ragged edge, and it is even whispered that a prudent young man will not marry a girl who has an excess of sisters, for fear he may be compelled to use up the best part of his salary purchasing gifts. But that is merely hearsay.

It is said that a few gentlemen in the nutmeg country a few years ago sought to reduce expenses by introducing an irredeemable paper currency in the shape of Christmas cards. It would have been a great saving if they could be substituted in place of bracelets, necklaces and diamond rings. But the economic scheme was a failure. There was no authority to enforce this sort of script in lieu of bonnets and jewelry. Indeed, it recoiled on the heads of the unhappy inventors with fourfold vengeance, for the printers put up the style and price of cards, and the poor fellows were compelled to purchase and give away these expensive cards, and at the same time continue the usual budget of holiday expenditure.

There is a rumor that a very learned professor in one of the New England colleges, a rusty old bachelor, received last Christmas about 20 little dishes for holding cigar ashes from as many lady friends, and toilet soap enough to cover the bureau, washstand and all the chairs in the room, and concluded to tackle this question of giving. After tugging at it for a long time, he struck on a scheme he thinks will give general satisfaction. The plan is for each one to give precisely what he or she wants, and as soon as convenient establish a sort of clearing-house, by means of which an exchange of gifts may be arranged. That is, let the head of the family give his wife a meerschaum pipe, his daughter a gentleman's overcoat, his sister a fine hunting-dog; in return his wife may present him with a diamond necklace; his daughter, a sealskin sacque; his sister, a new bonnet. Of course each one must appear to be delighted, and when the clearing-house is opened each one will receive back what he or she gave, and the result is that all are satisfied and everything is lovely.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

California Dried Fruits and Nuts,

(Continued from page 503.)

are in the front rank of great California industries. The California prune is not really in competition with the imported French prune, because it is a better fruit, of better flavor and of better keeping qualities. The far western trade discovered this fact some time since with the result that our prunes have not only largely supplanted the imported prunes in the great western markets, but for the past two years they have actually sold on the average at from one to three cents a pound above the French prune. The California prune is like a date, and, when cut, of a bright golden color, when cooked it is superior to anything grown elsewhere.

All first-class packers now grade their prunes with satisfaction to the trade. The growers this year realized from 2 to 2½ cents per pound for the fresh fruit, showing a splendid profit, and when packed prices have ruled from 9 to 14 cents according to sizes. From the large number of new orchards coming yearly into bearing, we can safely estimate the product in 1888 at 3,500,000 pounds, or say 15,000,000 pounds of the green fruit.

The Santa Clara valley is the home of the best California prunes.

California German Prunes.—While California can produce a nice German prune, the French prune is so much superior that the German is neglected. The result is that little or no progress has been made in the production of the German prune in this State. The tree here produces abundantly, but the price is so much lower that growers prefer to plant the French prune. Some little has been done in setting out new orchards in this fruit, but we cannot say that the outlook is very promising for a profitable market. The imported Turkish and Bulgarian prunes, dirty trash, which are imported here in casks from Europe, supply what trade there is on this coast for a cheap prune. We think, however, that the day is not far distant when this nasty mixture from Europe will cease to be quoted in this market.

Sun-Dried Apples.—The low prices that have prevailed for the last two or three years for our sun-dried apples have very seriously curtailed the product, as there was no money to the producers in putting them up. What drying has been done in the last year or two has been in the way of evaporated bleached apples, something for which we are profoundly thankful.

Sun-Dried Peaches.—We report a large increase in the product over 1886. The Eastern crop, however, was short this year, and California was subjected to a most extraordinary demand from all quarters, which principally cleaned up the whole crop at good prices to the producers. In addition to this the demand for our green peaches this year, for canning purposes, also was equally heavy, and growers found no difficulty in selling either to the canners or to the dryers, at prices which returned them handsome profits. The quality of the dried peaches this year, as a whole, has run good, although in some sections the product was damaged by untimely showers, which blackened the fruit during the drying process. There is no fruit produced in the world in the way of a peach like the California in size or in flavor, and when properly prepared for market it realizes the highest prices in all the markets of the Union.

Sun-Dried Pitted Plums.—Such low prices have been ruling on this fruit for two or three years that growers became very much dissatisfied and fed their fruit to the pigs, let it rot or sold it to the canners at whatever they could get for it. The result was a small out-turn of dried pitted plums. This, however, brought about increased prices, and what packers realized for such stock as was prepared, should show a nice margin to the producers. We go out of the year with a very light stock here, and it is quite likely that another year's supplies will be more ample. For trade, who like a tart fruit, there is nothing grown anywhere superior to the California pitted plums.

Sun-Dried Pears.—We report a small quantity dried this year, owing partially to a shortage of the crop of proper varieties and also a good demand for canning purposes; like apples, the demand for pears nowadays is largely running on evaporated bleached fruit, which have a fair steady jobbing demand and brings fair returns to the producer. We recommend that all growers of this fruit bleach it, and the common sun-dried unbleached fruit be done away with.

Dried Grapes.—There has been quite a large increase in the quantity of fruit this year. The California dried grape not only makes a good cheap cooking raisin, but it also makes an excellent table sauce when properly prepared. It is produced principally from the Mission and Zinfandel grape, and as its excellence is becoming better known, the trade for this fruit is constantly extending. Putting these grapes up dried, affords another outlet to all growers of grapes of these varieties who find a dull market in selling them for wine purposes. It also gives them an outlet and relieves them from any squeezing on the part of the wine-makers.

Sun-Dried Nectarines.—No finer fruit is grown in California than the nectarine. In fact it is one of the choicest produced in this State. It has, however, been greatly neglected by the trade generally. This principally has come, no doubt, from a lack of knowledge of the superiority of

this fruit. Wherever the nectarine has been used it is noticed that duplicate orders follow. In our opinion, the nectarine in flavor is superior to the apricot or peach, and we hope to see the time when they will rank equal in price with either of these fruits and be taken freely. There are many sections in California where the nectarine is produced most abundantly and of the most luscious fruit.

California Figs.—The product this year is very fair, but on account of low prices less attention than formerly has been paid to drying them. The California black fig, outside of its color, which is against it, is equal, in our opinion, to the imported fig for all purposes of consumption.

Their color, however, is against them. The White Smyrna fig is being grown in California in certain sections and is doing well, and we hope to see a large increase in this industry, as there is no question whatever that California can produce a white fig equal to anything that comes from abroad. We have seen some white figs produced in the central and southern portions of the State that were handsomer and finer than anything that we have ever seen from Smyrna.

Sun Dried Apricots.—While the output of this fruit for the past season has been in excess of last year, the demand has been so good from the East that the whole stock has been rapidly absorbed, and at present there is little or nothing left in this State for sale.

Evaporated Apples.—We report an increase in the product of this fruit over last year and generally of a better style of packing. This is very commendable. The sale for the California evaporated apples is principally confined to this coast and for shipment to Australia and the Pacific Islands. Our apples are not as tart as the Eastern apples, and, as a general rule, not as carefully put up, and for this reason, as yet, they have not made much progress and met with much favor in England, but as we are now beginning to put up apples from the foothills, and are yearly improving in our style of packing and carefulness in selecting, we have no doubt that the time is not far distant when California evaporated apples will be found side by side in the London and Liverpool markets with the apples from New York and Maine.

Evaporated Bleached Apricots.—As will be seen by our figures, there has been a very heavy increase in the production of this fruit over 1886. This was a good year for apricots, and while the demand from the canners was something extraordinary, it was equaled or exceeded by the demand from the driers in all sections of the State. The product as turned out, we are glad to state, also exceeded in quality, in appearance and in style of packing anything before produced in California. As large as this product was, the great bulk of it has already been sold and gone into consumption. The price of the green fruit this year ruled from 1½ cents up as high as 2 cents per pound, and for the dried product from 13½ to 17 cents. In the face of this being a very abundant year, next season we may look for a lighter crop.

Evaporated Peeled Peaches.—As will be noticed, the product this year is largely in excess of last season, but the bulk was sold for Eastern shipment, early in the season, and has largely gone into consumption. We are pleased to note that peeled peaches in California are being yearly indulged in on a more large scale, for the reason that we believe peeled peaches pay the producers better, and while the trade is not as large as for the unpeeled, the demand from all portions of the country is constantly on the increase. We would recommend for the coming year a more general putting up of this fruit in two and five-pound packages, as in that style the consumption will be increased in all portions of the country.

Evaporated Unpeeled Peaches.—A very heavy increase is noted over the product of last year of this fruit, and generally of better quality and more tastefully packed. The California evaporated unpeeled peach has really no competitor anywhere, because it is of better flavor and finer generally. Notwithstanding the heavy quantity put up this year, the stock now carried in California is extremely light, and not enough more than will be required for the running coast demand from now until the end of July.

Evaporated Pitted Plums.—What we have said of the sun-dried will apply to the evaporated. The low prices last year very seriously curtailed the putting up of this product this year. What has been prepared, however, has been of nice quality and has brought figures highly remunerative to the growers. We can hardly expect, however, any very heavy demand for evaporated plums, for the reason that the sun-dried pitted plum is of such excellent quality that at the difference in price the majority of the trade will take the fruit.

California Walnuts.—We estimate the product this year at 1,500,000 pounds, which shows a very gratifying increase over 1886. It is also a pleasure to note that the best California walnuts properly bleached, and due attention being paid to careful grading and curing, are now, in a large measure, supplanting the imported article. It was only a few years ago that a California walnut, even that was as good as the best imported as far as eating quality, was sold in the Eastern and Western markets at anywhere from three to six cents per pound under the imported. This, however, is now being changed, and discriminating dealers will take our best walnuts at prices equal to and in many

instances exceeding the imported goods, and there is no reason why they should not, as they are not only fresher than anything that comes from abroad, but are of better flavor, and the quality certainly is not inferior. California offers a fine field for the production of these nuts, and while there are a good many new orchards being planted, we do not think the attention is being devoted to this industry that is warranted, by the fact that we have the United States for a market. The best walnuts come from Southern California.

California Almonds.—The product this year is a light one owing to various causes, but the quality has never been better. The low prices prevailing in New York for the imported almonds, has not left much margin of profit for the California almonds, but it is with pleasure that we state that like our walnuts, we find a wide-spreading and increasing demand every year. The Terragona imported almond has been the principal nut in favor by the Eastern trade. This is a very large and thick-shelled nut, and is not to be compared with the soft-shell California almonds in any way. It being of larger size and there being nothing else to compete with it, it has taken the bulk of the trade, but there is no question that it has seen its best days, and that the soft-shell almonds of California are rapidly taking its place. Dealers are generally finding out, and consumers especially, that paying 14 or 15 cts. per pound for a shell is a pretty dear price. The shells of the California almonds are very light, and the dealer principally in buying these nuts, gets meat and not shells.

We will give next week the portions of the review pertaining to the honey production.

Southern Santa Cruz County.

EDITORS PRESS:—Since my last communication I have taken a general survey of the southern portion of Santa Cruz county, and can bear testimony to the oft-repeated fact of the excellence of its soil, climate, and productions. The neighborhood of Soquel boasts of many excellent farms, which, with two or three exceptions, range from 80 to a few hundred acres in size, and are generally well improved. While every variety of fruit known to California is produced here, fine apples are a specialty. Many of the apple orchards are just commencing to bear fruit. The ranch of H. P. Gregory, one mile south of town, is one that attracted my special attention. It consists of 300 acres of fine rolling land, upon which the proprietor has an orchard of 6000 fruit trees of various kinds, principally apples and prunes. He has also a very promising vineyard of 70 acres just beginning to bear, and will increase the same considerably next year, and erect a winery. Through the courtesy of Mr. J. D. Esty, superintendent, I was furnished a saddle-horse to ride over the place, and mounting some of the higher knolls, the sky being clear, I was afforded a magnificent view of Monterey bay and surrounding country. Mr. Gregory also believes in good stock, as his herds will show. One of the curious features of the ranch I observed was his Shetland horses, a stallion and several mares, imported in 1881 from Australia. Judging from present appearances and the plans for future operations on this ranch, I am led to the conclusion that it will eventually rank with the most important in the county.

A half mile further south is located the tannery of Moore & Co., at which was told a No. 1 article of shoe and harness leather is produced. The tannery employs twenty men, turns out six hundred sides per week, and is under the efficient management of Mr. James McDonald.

I passed the night at Aptos, which is considered attractive as a summer resort, being visited by hundreds every year during the "heated term." As a resting place it has a just claim over many other points whose fame has been heralded all over the continent. Beautiful streams of excellent water flow down from the Coast range, the spurs of which jut to the edge of the ocean. The landscape is clothed with scattering redwood and other species of evergreen timber, while the several mineral springs in the vicinity, among which is the Nichols, afford additional attractions to tourists and health seekers. The beach is equal to the best on Monterey bay for bathing purposes. This point is further noted as the country seat of Sir Claus Spreckles, the great sugar king. I paid his elegant homestead a visit and was placed under obligations to Messrs. E. Larson, foreman, and R. Cleary, in charge of the fine stock of the ranch. The admirer of good blooded horses will be well repaid for a visit to this place. Among a score or two of specially fine animals I was most attracted by a Gay Wilkes colt, for which, at three months of age, an offer of \$2,000 was refused. Also a Director filly I was shown, seemed to lack nothing in point of excellence.

Passing through a rolling section of country four miles further south, I was comfortably provided for by Mr. W. W. Wilson, the genial hotel-keeper of Corralitos. Mr. Wilson is also the dispenser of happiness to this community by handing out the daily mail. He is one of the most public-spirited men of the place, as shown by the offer he makes of a site *gratis* for a fruit-drying and canning establishment, for which the place is specially adapted. The hills and vales tributary have become famous for peaches, apricots, prunes and apples, and large

orchards may be seen in every direction, the finest of which I visited was that of the Bowman Bros, hard by. They have 50 acres of very thrifty trees just coming into bearing, and are constantly increasing their orchard. These gentlemen are also engaged in the nursery business, having now on hand 40,000 fine trees for the market. As an instance of the capricious nature of Californians, I cannot refrain from citing the fact that but one year ago Bowman Bros. were compelled to dig up and burn 75,000 French prune trees, not being able to find sale for them, while this year the nurseries can supply but a tithe of the number wanted, and some men are complaining at the lack of enterprise on the part of nurserymen for their failure to meet the demands of the market. Corralitos, meaning in Spanish little corral, is aptly named, being fenced in by hills on every hand. The village has a population of 300. Its principal enterprise is the Corralitos paper mill, which employs 50 men and furnishes a market for considerable wood, straw and lime obtained in the county.

Green Valley.

A portion of the Pajaro valley proper is one of the most beautiful and productive sections of the county. The first glimpse I obtained of it as I ascended the hill south of Corralitos forcibly reminded me of one of the most charming sections of this coast, the Walla Walla valley, W. T., to which Green valley has many points of similarity. W. M. McGrath's fine dairy farm is located here. The proprietor maintains 125 head of good dairy cows on the place, and makes cheese a specialty. This product of this year was 60,000 pounds, which was marketed at an average of 13 cents. The farm of 400 acres is divided into 25-acre fields, with living water in each. Adjoining is located Mr. C. H. Cornell's farm of 185 acres, which he is converting into an orchard year by year, 30 acres being already adorned with thrifty trees.

On Wednesday night I partook of the hospitalities of Mr. and Mrs. A. P. Roache at their homestead, a few miles north of Watsonville, and I shall long entertain a pleasant recollection of the occasion. Thursday I visited the home of A. Mendia, Green valley, a Spanish pioneer of early mining days. Like a large percent of the good people of the valley, he is a staunch friend of your journal. I next visited the great berry farm of Stewart, Buckley & Thurber, two miles north of Watsonville, of which Mr. I. Thurber is manager. One hundred and fifteen acres are planted to strawberries and 40 acres to raspberries. The soil is well adapted for this branch of husbandry, and yields of strawberries, 50 chests per acre yearly or 4500 pounds. The farm is for the most part level, though the site of the residence is on rising ground and commands a fine view of the country for many miles around. The water for irrigation is by means of a Colli's engine, raised 52 feet, and sent to every section of the farm by flumes. Owen and Morris B. Tuttle are ranked with the most enterprising hop growers of Pajaro valley, their farms being near Watsonville. They have two crops on hand yet awaiting a more remunerative market.

I was pleasantly entertained on the night of Sunday, the 18th inst., at the comfortable home of J. K. Myer five miles west of Watsonville. Mr. Myer, prosecutes the business of dairying, for which he has one of the best locations along the coast. His farm consists of 1000 acres of excellent tillable and pasture land, watered by numerous springs and sheltered by scattering groves of timber. This gentleman served an apprenticeship to the art of butter and cheese-making many years ago in the Buckeye State, but is still able to profit by the reasonable hints contained in your journal weekly.

Among other model farmers whose places I visited in the fruitful Pajaro valley, was Messrs. C. H. Porter and L. P. Helmer. The latter gentleman has lately perfected an improvement of the cultivator, by which orchards can be cultivated without danger of barking the trees. A cut of this valuable invention will shortly be forwarded for your columns. Mr. Helmer already finds the demand very large among his neighbors.

Watsonville, the principal town of Pajaro valley, is situated on the bank of the river of this name. It is a thriving, prosperous town of about 3000 people, which number is promised to be greatly augmented in the near future.

The establishment of Spreckles' beet sugar factory, now an assured fact, is looked upon as the great motor that shall infuse new life into the town and rapidly transform it into a rival of cities many times its present size. With the many advantages of the location, backed up by such a fine farming, stock and fruit country, and the establishment of so important a manufacturing enterprise as sugar-making, I think there is good reason upon which to base sanguine predictions as to the future growth and prosperity of the place.

F. B. L.

ORANGE TREES.—Orange planters will be interested at the announcement in our advertising columns of orange trees grown in the foothills by Fred. C. Miles, manager of the Aloha Nurseries at Penryn, Placer County.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm better each year, is the problem for the farmer.

FERTILIZE!**FERTILIZE!****NITROGENOUS SUPERPHOSPHATE.**

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KOEBIG—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....12.90 per cent
Reverted Phosphoric Acid......95 "
Insoluble Phosphoric Acid......2.83 "
Pota-h......2.23 "
Ammonia......1.87 "
Nitric Acid......2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

Dr. J. KOEBIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1/2 pound to 5 pounds each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

S. F. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Dec. 21, 1887.

The volume of trade, the past week, was confined chiefly to such articles as find free consumption during the holiday season, but even these have not shown up to this writing any appreciation in prices. Continued dry weather is creating a strong tone for hay and cereals of all descriptions. Good soaking rains are sadly needed in about all the agricultural districts. The Eastern markets for wheat, barley and corn have held strong throughout the week, which creates an impression that a higher range of values will obtain after the holidays. The European wheat markets have held strong, notwithstanding the heavy arrivals of foreign. To-day's cables are as follows:

LIVERPOOL, Dec. 21.—Wheat—Holders offer moderately; No. 2 winter, 6s 8d, and firm; do. spring, 6s 8d and firm. Flour—Holders offer freely at 9s 2d, and dull. Corn—Holders offer freely; spo., December, January and February, 4s 10d, and dull.

Foreign Review.

LONDON, Dec. 19.—Mark Lane Express, in its review of the grain trade during the past week says: English wheat is weaker and ruling prices lower. The sales of English wheat during the week were 64,644 quarters at 31s 2d against 63,866 quarters at 33s. 4d for the corresponding period of last year. Flour is dull. The foreign wheat trade is further depressed. India and Russia have declined its without buyers. At Liverpool there has been a fall of 2d per cent. Corn and oats are 3d cheaper. Linseed is 1s lower; 20 cargoes of wheat arrived; two were sold, five withdrawn and five remained. To-day the tone of the wheat trade was somewhat improved. English wheat (white) is firm, though nominally unchanged. Flour is 3d lower. Corn recovered 3d. Oats were 3d cheaper on the week. Beans and peas were unchanged.

Miscellaneous.

NEW YORK, Dec. 20: Lima beans are quiet. Old, \$2.25. New California white may be wanted, as they are more in demand here than foreign, which, on arriving, take their place on a scarce market, and would probably bring \$2.26.

Syrup-cured apricots and crated in 2½-lb boxes are in the market.

Wine, as before noted, enlarges the sales to the grocery trade. The price depends much upon the skill of vault-owners.

Honey, strained, 8@9c.

Peas have yet the Boston cases to compete with. Winter Nellis, shrunken, \$2.50; good, \$3.50@4; extra large, \$5.

Slimon is dull and last-quoted rates prevail. Mustard seed is nominal at 3¼@4¼c for yellow and 4¼@5c for brown.

Hides are dull, with sales of 23,500 lbs, mostly on private terms.

For hops, shippers make low bids. A round lot of low grade California was pressed for sale at 7c; new 6@10c; old State, 9@17c; common to best, new foreign, 10@20c.

Eastern Grain Markets.

CHICAGO, Dec. 21.—Wheat, firm; cash, 77c; Jan. 77½c; May, 84½c. Corn, stronger and higher; cash, 48½c; Jan. 48½c; May, 54½c. Oats, steady; Jan. 30½c; May, 33½c. Barley, nothing doing.

Wool.

NEW YORK, Dec. 20: Domestic wool is moving on at about former values, though some sellers have shaded high grades to invite business. Sales of 95,000 lbs X and XX, 31@32½c; 10,000 lbs one-quarter blood combing, 37c; 5000 lbs clothing, 37c; 10,000 lbs three-eighths blood unwashed, 39c; 10,000 lbs one-quarter blood, 27½c; 2000 lbs medium unwashed combing, 30c; 10,000 lbs super pulled, 35@36c; 50,000 lbs Territory, 19@22c; 10,000 lbs Oregon, 16c; 34,600 lbs domestic, 35,000 Persian, 80,000 Mexican and 95 bales East India were disposed of at private terms.

BOSTON, Dec. 20.—Wool is in improved demand. Prices favor the buyer. Texas, 31¼@32c; Michigan, 28½@29½c, and No. 1 wools 34c; Eastern Oregon, 16@19c. Pulled wool, supers, 20@25; extra 27c; other grades unchanged.

PHILADELPHIA, Dec. 20.—Wool is dull and prices nominal.

Local Markets.

BAGS—The market shows no material change. The absence of rains is against holders. Futures and also spot are weak at 7@7½c.

BARLEY—The sample market has ruled fairly steady throughout the week. The supply of heavy, plump grain is light. Brewers took more freely the past week, but fought against an advance. In options, trading has been fairly active, with only slight fluctuations. To-day's sale on Call, is reported as follows:

Morning Session: Buyer season—100 tons, 97½c; 100, 97½c; 400, 97c. Buyer 1887—100 tons 87½c @ ctt. Afternoon session: Buyer season—800 tons, 98c; 800, 97½c. Buyer 1887—100 tons, 88½c. No. 1 Brewing, buyer 1887—100 tons, \$1.01½ @ ctt.

CHEESE—Eastern is coming in more freely, and sells at 12c@14c. Choice Californian is in light stock; the bulk received is off-grade.

BUTTER—Pickled is about out of the market. So scarce is it that dealers have paid 29c for poor stuff and 22½c for stuff fit for axle grease. Fresh roll, while quotable at 45c for fancy, moves slowly, as dealers only buy in small lots. More Eastern is coming in, which kind is solid, packed down.

EGGS—The market shows more strength, but as liberal supplies are on the way from the West, it is claimed that it will only be a short time before lower prices will rule. The demand is free.

FLOUR—The market is fairly steady, although a good demand is reported.

WHEAT—Buyers have been fighting against the

higher quotations, but pressing necessities bring them in at full figures. Sales are still made for parcels of No. 1 white shipping, favorably situated at over \$1.40 per cental. In options, trading has only been fair, but the fluctuations were more attractive, which brought in a few more operators from the outside. To-day's sales on Call are reported as follows:

Morning Session: Buyer season—400 tons, \$1.48½; 700, \$1.48½. May—100 tons, \$1.46. Buyer 1887, season's storage paid—200 tons, \$1.38½ @ ctt. Afternoon session: Buyer season—200 tons, \$1.48½. May—200 tons, \$1.45½. Seller 1887, old contract—700 tons; \$1.35½ @ ctt.

COMMUNICATED.]

Market Information.

The following are the receipts of the principal items of California produce at San Francisco from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

Potatoes, sks.	28,020	2,247

Cereals.

The United Kingdom's wheat supply (including flour) for the 14 weeks ending December 3, 1887, (including British and foreign), was 59,723,357 bushels, comprising 22,044,928 bushels English and 37,679,429 bushels foreign. The average weekly supply in 14 weeks has been 4,265,954 bushels, against an estimated weekly consumption of 4,000,000 bushels indicating that in 14 weeks 3,723,356 bushels have been added to the reserve that existed on the 1st of September last, and these were above the average normal stock of about 16,000,000 bushels in all the importing ports, flour and wheat included.

The average price of British wheat for the week ended December 3, 1887, was 31s. 3d. per 480 lbs., equal to 94 5-10c. per bushel, against 93c. the preceding week. The average price for the week ended October 1, 1887, was 28s. 5d. per 480 lbs., the lowest reached this season, and is now 2s. 10d. per 480 lbs. or 8 9-10c. per 60 lbs. advance. The rise in French and other continental markets in the same time has been about the same as in English markets.

Wheat exports from British India during the week ended December 3, 1887, were 220,000 bushels, comprising 100,000 bushels to the United Kingdom, and 120,000 to the continent of Europe, against 100,000 bushels the previous week, including 80,000 bushels to the United Kingdom and 20,000 bushels to the continent, and from January 1 to November 19 the exports of wheat from all British India ports have been 27,371,000 bushels, against 40,204,000 bushels, the corresponding period in 1886, being a decrease of 12,828,000 bushels.

The quantity of wheat remaining in this country on December 1, 1887, available for exportation, is about the same as it was a year ago. (For particulars see statement elsewhere in this issue.) About one-half of our surplus had, on December 1, 1887, been disposed of by export in the five months from July 1 to December 1. The probable approximate quantity for export from the Pacific coast on December 1 was about 10,800,000 centals.

The price of wheat after the turn of the year, provided there is no war in Europe, will depend very largely upon the crop prospects in the United States and in Russia, particularly in the month of April.

Oregon mail advices continue to report free exporting of wheat, with Eastern Oregon fetching from \$1.15@1.22½ and Western Oregon from \$1.17½@1.25. The stock now held in Portland is claimed to be about the same as at this date in 1886. Considerable of the Valley wheat is taken for California millers.

In the local market there is no particular change in wheat. For stiffening and topping off, good prices are paid, but outside of this, buyers haggle and bid down, only paying full asking prices when compelled, so as to save demurrage. The tonnage loading keep large, notwithstanding the quick dispatch given to ships on berth. The outlook is favorable to low freights to Europe, as the high price of coal is sending quite a fleet of vessels to this coast, loaded with coal. They will take wheat out as return cargo.

Corn is strong at a higher range of values. In speaking of the Western situation, Bradstreet says that with a shortage of 30,000,000 bu. of potatoes (20 per cent), 25,000,000 bu. of oats (4 per cent), 7,000,000 bu. of barley (12½ per cent), and 212,000,000 bu. of Indian corn (12 per cent), the effect on the price of corn (with short crops in Southeastern Europe) promises to favor holders.

Oats are strong and in demand causing no concessions to be made except for parcels on the wharf, so as to save expenses. The stock is light.

Barley is steady with a strong tone for the more choice grades. Although receipts have been free, yet the stock is decreasing under a large consumption.

Bright, large, plump barley is wanted by brewers, for which they pay good prices. The bulk of brewing is light weight and inferior to last year's.

Rye and buckwheat are firm at the advanced quotations.

Feedstuff.

Hay continues to hold under a good consumptive demand, and moderate supplies to draw from. The dry weather is an important factor in keeping values well up. Choice grades are very hard to get, that now called choice is only fair to good.

Brans and middlings are strong at an advance. Feed meal is improving, while ground barley remains steady.

Fruits.

Grapes continue to come to hand, but move slowly. Eastern apples have come to hand, with heavy shipments on the way. Oregon continues to send us liberal supplies. The market is strong for choice, under a good demand.

Pears are in good supply for the season, but the market is strong for the more choice.

California oranges make a better showing. The market is steady. Limes and lemons are unchanged. The stock of dried fruits is slowly increasing. The demand, as usual at this season of the year, is light. After next month a free inquiry is expected to set in and a much higher range of values rule. Acting under this belief large holders are storing.

Raisins are in good demand, but as usual large dealers are working off their own stock, holding consignments in reserve. To sell out a consignment parcel fully 10 per cent lower prices would have to be accepted than we quote. The stock of choice raisins is very light, almost nothing. The stock of other grades is less than ever before in this month. The Eastern market is very strong with much higher prices looked for by spring.

Live-Stock.

Butchers are running chiefly on Christmas meat, consequently off quality cattle are somewhat neglected although a steady tone prevails. Mutton sheep are in fair supply. Freer receipts of lambs are reported. Hogs continue to move off freely, particularly the more choice, hard, grain-fed. Acorn-fed are not coming in freely yet. Several sales are reported the past week of matched teams. One well-mated, good steppers, gentle and at the same time of good carriage, fetched nearly \$300. Another span was sold at \$1000. General utility horses fetch from \$200 to \$350 each, as do drivers, although sales of the latter are reported at over \$500. Work horses continue slow.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7½@7¾c; first grade, grass fed, 6½@7c; second grade, 6@6½c; third grade, 5½@5¾c.

MUTTON—Ewes, 5½@6c; wethers, 6@6½c. LAMB—Spring, 7@8c.

VEAL—Large, 6@7c; small, 6@8c.

PORK—Live hogs, 4½@4¾c for heavy and medium; hard dressed, 6½@7c per lb; acorn fed. 4@4½c; dressed, 5½@6½c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Raisins.

NEW YORK, Dec. 20: Loose raisins have been well taken for the season's wants and are now quiet and easier. High-grade London layers are firm; Two-Crown Malaga, \$1.30@1.50; Three-Crown, \$1.70@1.80; Three-Crown London, \$2.25@2.30; fancy, \$2.50. The receipts are liberal, but not oppressive as the Pacific packings now sell upon their merit, and standard sorts are selling strong.

Vegetables.

White potatoes hold strong at full prices, under light supplies of choice grades. Red varieties are in buyer's favor. At the East heavy importing of potatoes from Germany and Great Britain is reported.

Cabbages are strong at full figures. The supply is light while the demand is good.

Marrowfat squashes have a better tone.

In root vegetables, carrots are steady, while beets, parsnips and turnips are strong, with a good demand.

Miscellaneous.

Turkeys have not sold as well as expected. This is due to free receipts from the west. Choice, large well-conditioned hens, young roosters, ducks and geese have met with ready sales, but poor qualities had to be sold the best they could.

Hops are slow, with choice hard to get, owing to the bulk having been shipped to the East. It is claimed that better prices will rule, in the spring months.

Sales of wool the past week aggregate over 500,000, ranging at from 8c up to as high as 18c. There was very little that fetched the latter price. The stock here, as a rule, is not desirable.

Beans are strong at another advance. The stock here is light, while the demand is active, chiefly on Eastern orders.

Hides continue weak, but deerskins are strong and in demand.

Nuts are in light stock, and as the demand continues free, the market holds strong.

Honey continues to hold to full prices, but owing to so much adulterated being on the market, as high a range of values do not obtain as otherwise would.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	319,290	196,466
In port, disengaged.....	117,825	63,396
In port, engaged.....	22,856	63,706

Totals..... 458,971 323,568
To obtain the carrying capacity add 60 per cent to the registered tonnage.

San Francisco, Dec. 21, 1887.

Fruits and Vegetables.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations. Wines, Dec. 21, 1887.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING DECEMBER 13, 1887.
 374,727.—SECTIONAL HORSESHOE—E. W. Bingham, Portland, Ogn.
 374,828.—PURIFYING WATER FOR BOILERS—Chas. Elliott, S. F.
 374,667.—CLAMP FOR STEREOTYPE PLATES—Wm. Filmer, S. F.
 374,679.—ARTIFICIAL FUEL—J. I. Irving, S. F.
 374,680.—ORANGE GRADER—J. W. Keeney, Riverside, Cal.
 374,682.—MILL-STOCK FEEDER—C. F. Kendall, Stockton, Cal.
 374,686.—PLOW STANDARD—M. N. Laufenberg, S. F.
 374,690.—CLOTH-CLEANER—W. C. Meyer, Sr., Valhjo, Cal.
 374,747.—ELECTRO-MEDICAL APPARATUS—J. S. Muir, Hansford, Cal.
 374,693.—OPERATING ELEVATOR TRAP-DOORS—A. G. Page, S. F.
 374,696.—BLACKING BRUSH AND BOX—Geo. W. Peck, San Luis Obispo, Cal.
 374,753.—CHURN—W. W. Perkins, Palouse, W. T.
 374,697.—FRUIT-DRIER—C. A. Pitkin, Sr., San Jose, Cal.
 374,698.—FRUIT-DRIER—C. A. Pitkin, Sr., San Jose, Cal.
 374,681.—MACHINE FOR MAKING TOE CALKS—J. C. Kelly, Austin, Nev.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

F. B. LOGAN—Santa Clara Co.
 M. S. PRIME—Alameda Co.
 G. W. INGALLS—Arizona.
 WILLIAM POOL—Fresno Co.
 WM. WILKINSON—San Joaquin and Stanislaus Co.'s.
 A. F. JEWETT—Tulare Co.
 H. STANCKE—Arizona Ter.
 E. H. SCHAEFFLE—Nevada and Placer Co.'s.
 C. E. WILLIAMS—Yuba and Sutter Co.'s.
 EDMUND WRIGHT—Tehama and Colusa Co.'s.
 DR. STANLEY T. PEET, San Diego Co.

Plows.

The demand for agricultural implements has been unusually large this season. We are informed by Mr. Bull, President of the Bull & Grant Implement Co., that they have sold six carloads of the J. I. Case plows including the Little Giant, double, triple and quadruple gangs. Orders have been sent by telegraph and the trade can be supplied with this class of goods early in January.

Consumption Surely Cured.

To the Editor:—Please inform your readers that I have a positive remedy for the above named disease. By its timely use, thousands of hopeless cases have been permanently cured. I shall be glad to send two bottles of my remedy FREE to any of your readers who have consumption, if they will send me their Express and P. O. address. Respectfully,
 T. A. SLOCUM, M. C., 181 Pearl St., New York.

\$500,000

On Country Real Estate in large and small amounts at lowest rates, by A. Schuller, 106 Leidesdorff St., room 3.

ALL of the farmers in and around Galt are planting shade trees along the county roads.

ORANGE TREES.

Plant Trees Grown in Your Own Section. They do much better than others brought from a distance.

THE ALOHA NURSERIES,

Penryn, Placer Co., California.
 Offers a large home-grown stock of Orange Trees, California Fan Palms and Pepper Trees, Limes, Dates, etc., at prices to suit the times.

FRED. C. MILES, Manager.

MISS BISBEE'S BOARDING and DAY SCHOOL For Young Ladies and Little Girls, WILL REOPEN

WEDNESDAY, JANUARY 4, 1888,
 Cor. Seventh Avenue and Sixteenth St., East Oakland, Cal.

ORCHARDIST WANTED.

A man to take charge of a farm in Contra Costa Co. containing an orchard, a small nursery, some live stock, and some grain land. Address as below, stating age, experience, nationality, and wages expected. References required.

A. F., Box 2361,

San Francisco, Cal.

MUSICAL GIFTS

OF NEW BOOKS.

A Birthday Book of Musicians and Composers.

(\$1.25) by Gertrude H. Churchill. A book of fine appearance, quite suitable for a gift, and containing the names, date of birth and numerous quotations in prose and verse, all about 700 prominent musical men. Spaces in the book for every day in the year give an opportunity to record the birth of friends, etc.

Children's Musical Gift Book

(20 cents) is a very taking little gem with pictures and good songs.

Please examine Ditson & Co.'s Books of Musical Literature. They constitute quite a library, and are, individually and collectively, attractive.

KINKEL'S COPY BOOK. A Manual of Music. A convenient book for teachers, with the Elements of music plainly stated, good printed exercises and directions for written exercises. Price 75 cents.

VALUABLE PIANO COLLECTIONS.

Classical Pianist, \$1; 42 first-class pieces. Piano Classics, \$1; a great success. Young People's Classics, \$1; easy and refined music.

VALUABLE SONG COLLECTIONS.

Good Old Tunes We Used to Sing, \$1; 115 songs. College Songs, 50 cents. War Songs, 50 cents. Jubilee and Plantation Songs, 30 cents. Very popular books at very low prices. Any book mailed for retail price.

LOUIS, MO., 304 SACRAMENTO ST., SAN FRANCISCO, CAL.

SAN FRANCISCO SAVINGS UNION

532 California St., corner Webb.

For the half year ending with December 31, 1887, a Dividend has been declared at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum on term deposits, and three and sixty one-hundredths (3 60-100) per cent per annum on ordinary deposits, free of taxes, payable on and after Tuesday, 3d January, 1888.
 LOVELL WHITE, Cashier.

McLean's Orchard and Field Cultivator.

PATENTED AND MANUFACTURED BY

N. McLEAN, Watsonville, Cal.

This Cultivator has been in practical use for the past four seasons, and its popularity is increasing with farmers of all classes. It is the acknowledged superior of any other machine of its class, and long since passed the experimental stage, as its many merits and growing success attest. With the exception of the pole, it is entirely constructed of the best iron and steel, thus making it impervious to sunshine or rain. Many attempts have been made by other makers to improve on the McLean Cultivator, but their efforts have failed, and it remains the superior of all competitors.

For descriptive circulars, prices, etc., address

N. McLEAN, Watsonville, Cal.

Seeds, Plants, Etc.

GUM AND CYPRESS TREES.

All Fresh, Healthy, Hardy Stock, Regularly Transplanted in Boxes by Hand.

Monterey Cypress. 6 to 10 inches high, of 100 trees per box at \$2 per 100, or \$19 per 1000; (in larger spaces) 8 to 12 inches high, of 70 trees per box, at \$2 per box or \$25 per 1000; or 12 to 15 inches, of 50 trees per box, at \$2 per box or \$35 per 1000. Seedlings, 2 to 4 inches (slow grown), at \$5 per 1000; transplanted thick, 4 to 6 inches, at \$10 per 1000.

Monterey Pines. 4 to 6 inches of 100 trees per box at \$2.50 per box, or \$22.50 per 1000; 6 to 8 inches of 50 trees per box at \$3.50 per box, or \$30 per 1000. Acacia Melanoxylon, 15 to 20 inches of 35 trees per box at \$1.75 per box.

Blue Gums. 6 to 10 inches of 100 trees per box at \$1.50 or \$14 per 100. In larger spaces, 10 to 15 inches of 70 trees per box at \$1.50 per box, or \$19 per 1000; 15 to 24 inches of 50 trees per box at \$1.50 per box; 2 to 3 feet of 30 per box at the rate of \$5 per 100. Also large straight sarked or bulked Gums, 6 to 15 feet, at low rates.

U. S. stamps will be taken for sample boxes. All trees will be delivered promptly and in good condition, free to shipping points. Send all money orders, postal notes or drafts to

GEO. R. BAILEY,
Berkeley, Cal.

Box 108.

Our New Catalogue for 1888, mailed free on application, contains description and price of Vegetable, Flower, Grass, Clover, Tree and Field Seeds; Australian Tree and Shrub Seeds; native California Tree and Flower Seeds, Fruit Trees, and many new novelties introduced in Europe and the United States.

THOS. A. COX & CO.,

411, 413, 415 Sansome St., San Francisco.

NAPA VALLEY NURSERIES.

ESTABLISHED 1878.

Fruit Trees, Grapevines, Resistant Grapevine Stock,

And everything to be found in a first-class Nursery; also the following new fruits, obtainable only at these Nurseries:

Clyman—Earliest and finest shipping Plum.
Ulatis—Earliest and finest shipping Peach.
California Advance—Earliest and best Cherry.
Purity—Most beautiful, white, canning Cherry.
Black Mastodon—Largest black Cherry known.
Centennial—The finest keeping and shipping, light-colored Cherry. (This variety is now cultivated throughout the State; to be safe, however, it is best to procure it from headquarters.)
Commercial—The largest Almond.
Send for catalogue and price list. All stock unrigged and free from disease. LEONARD COATES, Napa City, Cal. For County Rights for a new and valuable FRUIT DRIER, address as above.

Orange Growers, Look Here!

J. VILLINGER'S

Covina Nursery!
150,000 ORANGE TREES

One year old from the seed. Absolutely the finest plant in Southern California. Will be carefully budded from the world's most famous varieties.
For particulars apply to

(Successor to W. B. WEST),

Stockton, Cal.

FANCHER CREEK NURSERY,
Fresno, Cal.,

OFFERS THIS SEASON FOR SALE A FINE ASSORTMENT OF

FRUIT & ORNAMENTAL TREES.

SPECIALTIES:

WHITE ADRIATIC FIG, SAN PEDRO FINEST TABLE FIG, JAPANESE FRUITS, OLIVES, POMEGRANATES, MULBERRIES, TEXAS UMBRELLA TREES, and also a fine collection of PALMS, YUCCAS,

ROSES, and OLEANDERS.

Send 10 cents in stamps for a sample of the dried and cured Adriatic Fig. Fall catalogue now ready. Address all letters to F. ROEDING, Fresno, Cal.

COMMERCIAL SMYRNA,

The ONLY GENUINE Fig of Commerce.

Selected and imported by us direct from Smyrna, it is the finest Fig in the world, and the only sort that should be planted for profit. The largest and finest list of NUTS in the country, at prices below competition.

NEW and RARE FRUITS of all sorts. Plants by mail a specialty. Send 10 one cent stamps for GUIDE to Fig Culture and Catalogue.

FLORIDA HORTICULTURAL COMPANY,

Cutler, Dade Co., Florida.

BARREN HILL NURSERIES

NEVADA CITY, CAL.

SPECIALTIES:

NUTS, PRUNES AND GRAPES.

The Finest Collection of "Nut-Bearing" Trees to be found in the United States.

21 Varieties of Walnuts,

INCLUDING

CLUSTER WALNUT (Juglans Racemosa).

The newest, most prolific and valuable variety ever introduced into this country.

PREPARATIENS,

Or FERTILE WALNUT, introduced into California in 1871 by Felix Gillet.

"Second" Generation Preparatiens,

(California Grown).

"Second Generation" trees, grown from nuts borne on the original tree; 80 to 90 per cent guaranteed to be "pure," or having retained the characteristics of the original Preparatiens, chief among them the surprising fertility of the kinds.

Third Generation Preparatiens or common French walnut (Juglans Regia), grown from nuts borne on Second Generation trees, all California grown. Vigorous and fertile variety, but the nuts smaller than those of the second generation.

GRAFTED WALNUTS.

Franquette Parisienne, Mayette, Chaberte, Meylan, Vourey and "Weeping" Walnuts, the leading varieties of Europe, highly recommended for the size, beauty and quality of the nuts, fertility, and above all, "hardiness" of the kinds.

We offer this season imported trees of the seven above sorts, expressly grafted for us, regardless of cost. The difficulty in grafting the walnut is such, and grafted walnuts are originally so scarce, that we are compelled to decline orders for such trees in quantities over a dozen. Only a limited number of trees of each kind from four to six feet.

"MARRONS," or French Chestnuts.

(Solely propagated from grafting.)

MARRON COMBALE (California grown).

10 Varieties of the finest kinds of Marron-Chestnuts to be found anywhere; at the head of the list "Marron Comble," which we have been fruiting upon our place the last 13 years; very large and sweet nut, prolific; one of the very best for market.

7 Varieties of Filberts.
4 Varieties of Almonds.
4 Varieties of April Cherries, the earliest and most prolific in California.

245 Varieties of Grapes, from all parts of the world, including the earliest Table Varieties known, some of them 25 days earlier than Sweet Water.

61 Varieties of English Gooseberries, all shapes and colors, some large as walnuts; all "true to name."

CORK OAK, 2-year-old Trees, from Spain.

Prunes! Prunes!

Lot D'Ente, or D'Ente "true from the root," one of the best and finest types of the "French Prune" and the kind so extensively cultivated in the prune district of France. This type is not propagated from grafting, which would do away with its chief qualities of being more vigorous, more long-lived than grafted trees, and a "gum-resistant" stock.

Also, the finest grafted types from the home of the Prune D'Ente or D'Agon, on Myrobalan, St. Julien and Almond stock.

Saint Catherine (true from the root), one of the finest dessert Plums, and one of the best for preserving and drying.

Paymirel D'Ente, Blue and Red Perdigon, German and Italian Quetsche, Alsace Quetsche, Knight's Green Drying, etc.

Apricots, Peaches, Pears.

Quinces, Plums, Mulberries,

Figs, Fancy Fruits, Etc.

FRENCH, ENGLISH, GERMAN AND AMERICAN STRAWBERRIES.

Send for General Descriptive Catalogue, illustrated with forty-one cuts, representing Walnuts, Chestnuts, Filberts, Prunes, Medlar and Sorbus.

FELIX GILLET,

NEVADA CITY, CAL.

HAWLEY BROS. HARDWARE CO.

WHOLESALE DEALERS IN HARDWARE AND AGRICULTURAL IMPLEMENTS.

GENERAL AGENTS FOR

HENLEY MONARCH FENCE MACHINE.

IS THE BEST AND HAS NO EQUAL.

1. **BECAUSE** the wire is stretched the full length of the field before the weaving is commenced.
2. **BECAUSE** any sized wire can be used, and with this advantage: using a large size wire, the strongest fence can be made.
3. **BECAUSE** any size, length, or style of picket, or slat, or board, can be used, weaving all equally firm and solid.
4. **BECAUSE** the picket or slat can be woven in more firmly and solidly than in any other machine.
5. **BECAUSE** it will make a fence over rough and uneven ground, or up and down hill alike, making as good a fence as on even, level ground; and the machine being adjustable, the pickets are always woven plumb.
6. **BECAUSE** the Monarch machine stretches the wire tighter, thus making the strongest and best wire and picket fence.
7. **BECAUSE** any one can operate it, and there are no parts to get out of order or repair.
8. **BECAUSE** a boy can work it as well as a man, it being light and easily managed.
9. **BECAUSE** it is made of the very best materials, and with proper care, will last a lifetime.
10. **BECAUSE** the price is within the reach of every farmer.
11. **BECAUSE** it is the only machine that forces the slat or picket firmly against the wire, thus securing the slat in such a solid and permanent manner that it cannot be pulled out, and breakage is impossible.
12. **BECAUSE** the fence made by this machine will turn all kinds of stock, and is much stronger than any barb wire fence, and completely obviates all danger of injury to stock.

A FEW OF THE ADVANTAGES

OBTAINED BY THE USE OF

THE WIRE and PICKET FENCE:

It will turn all kinds of stock, sheep, hogs, and poultry, without injury to same. The strongest wind will not blow it down, if properly put up, and the farmer can go to bed at night and rest undisturbed, knowing well that his crops are safe and well protected.

The amount of ground saved by this style of fencing over the common rail fence, is alone a great object, and would soon save the price of the wire and picket fence.

This wire and picket fence is generally set from two to four inches from the ground, thus allowing the farmer to mow down the weeds and undergrowth, and keep his farm in first-class condition.

While it is possibly not quite as cheap as barbed wire, it has many advantages over it, as any one can readily see.

It is cheaper than board fencing, as any kind of lumber may be used for pickets, and, if it is properly put up, will last a lifetime with very little expense. By weaving past the posts in wire and picket fencing, and not fastening the pickets to posts, the wood parts of fence do not come in contact, thus preventing rotting, as is the case with board fencing, as they rapidly rot off at posts.

Send for Price.

IS THE BEST AND HAS NO EQUAL.

13. **BECAUSE** by weaving past the posts, and fastening the wire strands to the posts with staples, and not nailing the slats to posts, thus keeping the wood parts from coming in contact with each other, it will not hold moisture or rot. This is a very important matter, as all boards in board fencing soon rot off at post, and occasion continued expense for repairs. And finally,

BECAUSE it makes the handsomest, best, strongest and most durable fence, and is the only first-class, practical Fence Machine in the world.

The foregoing are only a few of the points of superiority of the IMPROVED MONARCH FENCE MACHINE over all others, and a trial will convince any one of its merits, and that it has no equal. The HENLEY MONARCH FENCE MACHINE will make the best rabbit and poultry proof fence for nurserymen, gardeners and vine-growers, by weaving the slats close together; will also weave a handsome picket fence for lawns, gardens, and fronts of lots, with great rapidity and regularity. Will make the most substantial fence for farms and stock ranches. The MONARCH Machine is making a complete revolution in the methods of fencing. The fence made by this machine is destined to rapidly supersede all other styles and kinds of fence, both wire and board, and the cost of machine, and expense of fencing, puts it within the power of every farmer to inclose his land with the very best and most substantial kind of fencing, at a total cost far below that of any other kind.

HAWLEY BROTHERS HARDWARE COMPANY, San Francisco, Cal.

J. J. DEAL'S ROAD CARTS.

The
Most
Perfect
Road
Cart
Made.

Indorsed by the
Best Horsemen,
Stock Buyers,
Doctors and
Others.

LIGHT, DURABLE, EASY AND HANDSOME.
SIZES.

This new Cart represents the results of much careful study and close examination of the various speeding and exercising vehicles now in use. It does away with many defects which are found in others, combined with new and important features, making it the Easiest, Strongest and Best Cart on the market.

DURABILITY.

It is very simple in construction, strongly braced, double cross-bars, and the position of the springs in their relation with the seat-bars and cross-bars, lessens the strain on both the parts, which allows the same to be made lighter than on ordinary road carts, and at the same time securing more safety.

Each job is carefully constructed, by skilled workmen, from select second growth ash and hickory timber.

APPEARANCE.

It is undoubtedly the handsomest as well as the lightest road cart made. The seat hangs from 4 to 6 inches lower than on the ordinary cart, which fact is highly appreciated by all horsemen.

Carts are finished in Oil and Varnish, with Irons Blacked, or Painted Wine Color, and Fine-line Stripping.

Shafts are Tipped and Long Leathered. Shell Band or Wood Hub Wheels used.

These carts are built in three sizes, $\frac{3}{4}$, $\frac{1}{2}$ and 1-inch. The $\frac{3}{4}$ size is for light persons or track use. The $\frac{1}{2}$ for ordinary one man use, and the 1-inch are for two passengers, and have board seats, while the $\frac{3}{4}$ and $\frac{1}{2}$ have cane seats.

ADJUSTABLE.

The seat can be easily adjusted to suit the weight of the person.

THE FOOT REST

Can be removed by loosening two nuts and dropping hind end, unhooking same from cross-bar in front, making it a desirable sulky.

THE FLATTERING TESTIMONIALS

And large demand for the Cart are sufficient to defend the above statements. Prices and Terms upon application. Correspondence solicited.

\$3 a Year, In Advance.
SINGLE COPIES, 10 CTS.

The New Year.

As we write it looks as though the happy urchin conventionally used to betoken the birth of the New Year would receive his baptism by sprinkling, which, whatever may be the claim of the method denominationally, is the very best start a young year can receive in California. This generous storm, which is tossing about the ships on the bay and driving the rain in sheets against the southern windows, is the grandest possible agency to elevate the hearts and hopes of our people, and the fullest surety of a year's productiveness and prosperity. This gift to the agriculturists is, in fact, all that seems necessary to round out the smile of satisfaction which clothes the face of California at this most auspicious period in her history.

The closing year has been a notable one for California. It is estimated that 85,000 people have arrived in the State over the different routes of travel since Sept. 1st. Of course, many of these are winter-fliers, who will bask in our winter sunshine and return eastward, but the proportion of actual settlers is constantly increasing, and will increase in geometrical ratio, for who can measure the influence of the words which our winter guests will speak of the beauties and opportunities in California? The whole State is feeling the effect of the new life, which is begotten of flourishing industries and of charmed visitors with gold-lined pockets. Every one is confident and progressive. Our products are being diversified quite as fast as is desirable, for too rapid changes in production are not desirable. In business affairs, in public works, in efforts for promotion of culture, intellectual and moral, and, in short, in all things which minister to enlightenment and material prosperity, one can see many

hopeful signs in our horizon, and find much assurance that California life is worth the living. We trust this assurance it may be the

lot of all to share, and we speak to all our desire for them in the graceful design which the artist has furnished us for our opening page.

all will co operate to make both of the meetings in this State noteworthy and successful, and we believe he will find his hope realized.

The Twin Meeting.

Arrangements for the grand bi-partite meeting of the American Horticultural Society at San Jose Jan. 24th, and at Riverside Feb. 7th, are progressing well. Prof. Hilgard shows us a letter which he received from Parker Earle, the distinguished president of the society, which speaks glowingly of the prospects of the excursion, the large number of leading Eastern fruit-growers who will take part and of the wisdom of the provision for holding two meetings, one in each grand division of the State, which will enable the excursionists to see a large part of the fruit area of California and to meet so many California fruit-growers. Mr. Earle urges all who can of our Southern horticulturists to attend the San Jose meeting and the Northern horticulturists to visit Riverside, believing that the better knowledge of each other and of the different parts of the State will tend to a friendlier feeling between the two great regions of the State.

Mr. Earle is right in his position. Those who are now exhibiting so much local zeal at both ends of the State are, in most cases, those who do not know all the facts. Of course we do not mean to say that local preferences are misplaced, but the mistaken condemnation in the south of the north, and vice versa, results in most cases from lack of knowledge. Each part should and always will have its advocates, but there will come a time, and it cannot come too soon, when a more generous feeling each for the other will prevail, and it will be secured through better acquaintance and truer appreciation of the adaptations and resources of the State as a whole.

President Earle hopes

THE DAIRY.

Oregon Dairymen in Council.

In one thing at least the Oregon dairymen lead their California brothers, and that is in maintaining an association which holds regular meetings. The third annual assemblage was held in Portland last week, and the *Oregonian* gives a report of it. We select therefrom points which are of general interest.

Address of President J. B. Knapp.

From this document we give the following paragraphs:

The past year has been one of only moderate prosperity for our dairy industry. During the spring months competition from California in the butter trade reduced prices of our products to a moderate figure. Closely following this the annual overflow of the Columbia river drove all dairies from the bottom-lands for full two months and very seriously curtailed the amount produced, while at the same time an unusual drouth prolonged to a recent period rendered the upland pastures barren of feed, hence a short product the last half year.

Owing to these causes prices commenced to advance in June, and reached 30 cents before the close of August, and have since steadily advanced to 40 cents and likely to go higher before the close of the year. Prices ruling for the past four months have afforded our dairymen a rare opportunity to reap a harvest of profit if prepared to take advantage of it. But I venture the assertion that there is not a single dairy in our jurisdiction that was thus prepared. California has also suffered with drouth, and butter there is higher than here, and we are now importing from Iowa and Wisconsin to supply our deficiencies. The lesson it teaches I have on former occasions urged before this body, and it will bear repeating—"He who wishes to make a success in dairying and carry with it handsome profits must prepare an abundance of cheap, succulent, cream-producing food and feed it to improved dairy stock."

The methods of doing this have been so often pointed out in dairy publications, it is unnecessary to repeat them here.

At our first quarterly meeting of the present year the propriety of making a dairy exhibit was discussed and committees appointed to investigate matters in relation to it, and if deemed advisable, with power to act to carry the project into execution. It has resulted in our holding an exhibition of dairy products in connection with the Fat-Stock show in this city during the third week in October last. The entries were not as numerous as we expected, but the quality was pronounced excellent by a committee selected from among our business men of the largest experience in handling dairy products.

During the year improvement has been made in the quality of dairy products, owing to the introduction of machinery and dairy appliances and a better understanding of the business. Several new creameries have been started and more are contemplated. The products of our best dairies are appreciated by consumers and sought after by the business community who handle such goods, and they now give preference to Oregon products rather than to those imported from other States and at relatively higher prices.

The difference between butter made from cream separated by the De Laval process and the ordinary dairy is beginning to be appreciated; all the butter made by the De Laval coming to this market is taken upon the day of arrival and has for the past three months been quoted and sold at 10 cents per roll above that of the best dairies. This shows a proper appreciation of good quality and affords encouragement to dairymen to invest in machinery and better fixtures for carrying on the business. The total expense of making this our first dairy exhibit amounted to \$290.30, of which \$220 was paid for premiums and the balance for contingent expenses. Money for premiums to the amount of \$210 was subscribed and contributed mostly among the merchants and business men of this city. And I wish here to state that your committee soliciting such subscription met generally a generous response and good wishes for success and prosperity of the dairy industry. I make this statement because occasionally I hear farmers and dairymen growl about unfair treatment from merchants they deal with.

I am often asked the question, "Why don't you dairymen make more butter? We haven't got enough to supply our trade and are obliged to send to other States; we prefer Oregon if we could get enough of it." There is no antagonism to the dairy, but on the contrary, a general wish from all classes for the success of this industry. There is then much to encourage those engaged in it to continue, and for others to engage in it. It is one of the largest and most important industries of our nation.

Bogus Butter.

Oregon has given us a good law for our protection against vile imitations, and the national law is a good one. But, if we show no interest in it, have we any assurance that they will long remain upon the statutes? Our present Governor, in his zeal for economy and retrenchment, recommended in his inaugural a repeal of the Oregon dairy law. But, thanks to his intelligence, he has seen his mistake, appointed a commissioner, and is doing what he can to uphold

the law. We already have warning that efforts will be made at the present session of Congress to repeal the national law, or so modify it as to render it inoperative. Intemperate greed for the almighty dollar will leave no method untried, no stone unturned. The manufacturers of imitation butter see millions in it if they can succeed in neutralizing the law that protects the dairy. It is within my recollection that whale and fish oils and the cheap animal fats were used for the common purposes of illumination. Gas, coal oil, and later electricity, perform this office, giving a better light and more of it at a largely reduced cost, and as a consequence these oils and fats must find other uses for a market. By the aid of modern chemical science most substances can be very closely imitated, and by its aid the cheap animal fats are so manipulated as to form a compound so closely resembling butter in appearance and taste as to deceive even dairymen. This compound can be made at a cost of a few cents, and if sold at the price of butter, there is a profit of 300 or 400 per cent; hence if it can be made to succeed, there is millions of ill-gotten gain in it at the expense of the entire population of consumers, and the destruction of the legitimate dairy. Let it be distinctly understood the dairy asks for no protective tariff. It is able to stand on its own bottom. All the protection it asks is protection from fraud and deceit, and the great mass of the people have a vital interest in the same direction.

There is one little amendment to the national law and to the State laws I would like to see made, similar to that incorporated into the law of England this year by the British Parliament, viz: that all compounds or substances made and sold in imitation of butter shall be known and sold by the name of "margarine," and I would add, *shall be colored or painted red*. In such case neither the name, the sound of the name, the orthography nor color shall bear any resemblance to genuine butter, and would give no chance for deception.

Marketing Dairy Goods.

At the formation of our association one of the first objects aimed at was to induce dairymen in marketing their butter to concentrate all at one place. The object sought was a better regulation of prices, better facilities for handling and storing while being marketed. Although we found merchants willing to receive and sell, none were willing to incur the expense of providing suitable storage. Finally before the close of the first year, Henry Everding, a commission merchant of this city, decided to vacate a small room in his store, renovate it and devote it exclusively to the reception of butter; also built a large safe for cold storage. This was a commencement in the right direction and we recommended dairymen to concentrate their products there on account of the better facilities provided. The result has been that their trade in this line has more than doubled twice over. They are receiving new customers every month and so far as my observation extends I have not known any to leave them, which is the best evidence that they give satisfaction. It is a reliable, safe house to deal with; they make as prompt sales as the state of the market and the interest of their customers will justify, and prompt returns as soon as sales are made, and we are assured that they will provide additional facilities fast enough to accommodate increasing business. The advantages to dairymen have been, prices have maintained more uniform rates; again, it is a sort of headquarters for dairymen when they come to the city; and still another advantage, dairymen visiting the city can any day see 20 to 50 boxes of butter coming in from all directions and can learn something by spending a few minutes examining the make of different dairies, comparing them with their own and comparing their opinion with that of an expert in the business. It furnishes the best object lesson they can have.

Mr. Knapp related an incident of an old gentleman to whom he was introduced several weeks ago. The man said that 20 years ago he used to make butter in Oregon and sell it at 50 cents a pound in Portland. Since then he had been away engaged in other business. Recently he returned to Oregon and again engaged in dairying. The man related that he had had a peculiar experience with his first shipment. It consisted of three boxes of prime quality—all exactly alike. One box he sold to the storekeeper at the nearest railroad station for 25 cents, the second he consigned to a retail grocer in Portland, and the third to a wholesale commission-house. He received prompt returns from the grocer, who paid him 35 cents, saying he would take all that could be furnished at the same price. After a little delay, he received returns from the commission-house as follows: "Your butter sold at 12½ cents." Mr. Knapp added:

Twelve and one-half, 25 and 35 cents, all of the same date, same make and same quality. A regular dairy ladder of three rounds, ten degrees apart. It will require a very long-legged man to make the stride and climb it, and should he descend it often it would break his business if not his neck. Remarks would be superfluous.

Other Proceedings.

The address also alluded feelingly to the death of the secretary of the association, P. C. Heilman, and suitable resolutions of respect were adopted.

Mr. J. B. Knapp declined a re-election as president, and the following officers were chosen: President, Thomas Paulsen; first vice-president,

W. W. Baker; second vice-president, J. B. Knapp; recording and financial secretary, Edward Casey; treasurer, Plympton Kelly.

Informal discussion took place upon matters tending to promote livelier interest in the society. There was a general sentiment in favor of lectures on dairying by the Dairy Commissioner as provided for by the Oregon statute, and next spring was considered a good time to begin the work.

Against Repeal of the "Oleo Law."

The following resolution was passed unanimously:

WHEREAS, There will be a determined effort to repeal or so amend the United States oleomargarine law as to make it of no value to the dairy interest of our country; therefore

Resolved, That we most respectfully request our United States Senators and our Representatives in Congress to use their best endeavors to retain the law as it is, or have it so amended only as to make it still more effective.

Resolved, That the secretary be authorized to send a copy of these resolutions to our United States Senators and Representatives in Congress.

Adjourned to first Tuesday in March.

SHEEP AND WOOL.

California Wool-Growers on the Tariff.

According to announcement by circular issued Dec. 12th, there was a mass meeting of California wool-growers in Sacramento on Dec. 19th. The *Record-Union*, in its report, says the hall was well filled with representative wool-growers throughout the Sacramento and San Joaquin valleys, extending as far north as Mendocino. Among the prominent sheep men present were noted: J. H. Glide, W. G. Brown, Captain Wilbur, T. M. Gimshaw, E. H. Ward, L. L. McCoy, George Champlin, Frank L. Orcutt, Louis Meiss, C. M. Traver, H. O. Purington, J. H. Beckford, William Mitchell, E. H. Tryon, Mrs. I. S. Monch, J. H. Kilpatrick, W. R. Gallup and others, representing in all over 1,500,000 sheep.

The meeting was called to order by R. T. Devlin, representing James Kaseberg of Placer county, an owner of upward of 20,000 sheep. In calling the meeting to order Mr. Devlin made a short address, in which he said:

The question at last has come to the front in this country, shall we or shall we not be a free-trade nation? It is a question that perhaps, so far as wool is concerned, affects California more than any other State in the Union. We desire to retain the slight protective tariff that gives life to our industry. A common-sense view of the question shows us that without a protective tariff many of our industries will languish and die. So long ago as the administrations of Madison and Monroe the necessities of a protective tariff were spoken of, and the wisdom of that policy is what has made us the richest, most important and influential nation on the globe. In those early days we produced the raw material, which had to be exported to foreign lands, and the manufactured goods imported. If war came along and we were shut off from our source of supplies it was readily seen how much we would suffer. Under a system of protective tariff we have prospered and grown in wealth until to-day the United States ranks first in everything that goes toward making up a prosperous country, a happy and contented people. Here every man is his neighbor's peer. Even the poorest enjoy what in the old country would be called luxuries, but which in our own are regarded only as the necessities of life. Why should we go back to a state of affairs that will make us poor? Why adopt a system of revenue disastrous to home industry and in the interest of the laboring classes of foreign powers? They use the old argument that the poorer classes would be able to buy their woollen fabrics cheaper, but lose sight of the fact that labor would be greatly reduced thereby. It is the old story of the Kentucky statesman who, when speaking upon free trade, said: "Mr. President, if we had free trade, the material used in your suit of clothes could be bought for one dollar a yard less than you pay for it. What did it cost you?" The argument of the free trader was knocked completely out when the honest Kentuckian replied: "All wool, and only 38 cents a yard!"

Some years ago the protective tariff on steel rails, it was thought, would work a hardship on our country. Did it? No, sir. The European manufacturer ground down his labor, made the minimum of cost so low that they even then with the protective tariff could compete with our American manufacturers. Take off tariff, and immediately you reduce all American labor from 50 to 75 per cent; in fact, American labor will be thrown out of the market. No country can be happy and prosperous that is not a manufacturing community. We raise more food products than our country can consume. Turn the manufacturing people into agricultural pursuits, and see how soon it will be that labor will go down to a price that the farm hand could not buy woollen goods, no matter how cheap they were sold. Statistics show that we export more than we import. The balance of trade is on our side. There is a constant pour of gold from Europe to America. Take off the tariff as proposed, and the existing state of affairs would be immediately changed, and from the first nation of the world we would become the last, and from the richest and most

prosperous people we would become the poorest and most unhappy.

California is comparatively a new State, and the center of attraction to-day, not only of the United States, but throughout the world. Our principal products, barring our yield of precious metals, are wool, wine and raisins. Take off our protective tariff and you at once turn our fertile fields and productive vales into veritable Saharas. You take from us that which has made us; you take from us what is ours and what the good of the country demands we should have; you at once arrest immigration and turn the tide of prosperity elsewhere. Capital will seek elsewhere for investment than in the wool, wine and raisin products of California.

It is our duty, the duty of our State and nation, to see to it that our members in Congress and those in the executive offices of the nation do not discriminate against our own people and in the interest of those of the impoverished nations of Europe. Take off this tariff and you drive the wool men out of business. They cannot compete with the wool-grower of Australia, who has the advantage of pauper labor and millions of acres of unoccupied land. It means the throwing out of employment of thousands of American laborers, men and women; it means the stopping forever of the wheels of manufacturing that are the sole support of many thriving manufacturing centers; it means desolation and want in our own country. The American manufacturer must go out of business; his mills must decay and tumble to ruins; the mill-hands must seek other overcrowded industries; it means starvation and want.

The whole matter in a nutshell means a reduction in wages. If a reduction in one line, then a reduction in all, for competition makes the price. We believe that the future prosperity of this country depends on those who earn their daily bread by the sweat of their brows. This protective tariff not only protects the tradesman, but it protects the entire prosperity of the country. We would be no better off to-day than the countries of Europe were it not for our protective tariff. Were the duty taken off of manufactured goods to day we would have to compete with the serf labor of Asia. We are now confronted with an issue such as we have not had to meet since the organization of the Republic. It is a question of great importance, one that must be met by thorough organization.

The next thing in order was the election of officers. Hon. J. H. Kirkpatrick of Stanislaus was elected chairman, and L. L. McCoy of Tehama county, secretary.

A Committee on Resolutions was appointed as follows: E. H. Ward and Geo. Champlin of Tehama county, R. T. Devlin, F. L. Orcutt and E. H. Tryon, Sacramento county, and J. H. Kirkpatrick of Stanislaus.

A recess was taken until 1.30 p. m.

On reassembling the committee made the following report, which was unanimously adopted:

Resolved, By the wool-growers of the State of California:

1. The woolindustry of California and of the United States is one that has given employment to a large number of people, has enabled the American manufacturer to manufacture goods from American products, and is one so extensive that to cripple it would injuriously affect the industrial interests of the country.

2. That a reduction of the duty on imported wool would practically abolish wool-growing in California, as it is unprofitable for the wool-producer to compete, by paying the present standard of wages, with the cheap labor, and against cheaper ranges in other countries.

3. That with the duty of wool decreased, the small farmer who heretofore has derived a profitable revenue from wool-raising would be compelled to abandon this pursuit, as the reduction of tariff would fall most heavily on him.

4. That over 1,000,000 people, as shown by the last census, are engaged in raising wool, and when the large number of people who are dependent on these and are engaged in manufacturing woollen products are considered, the vast amount of capital invested and the large proportion of our people whose prosperity and in many cases whose existence depends upon the continued existence of this industry, which can be done only by the retention of the present duty, can be seen, to cripple this industry is to cripple the country.

5. The amount of duty is so inconsiderable, amounting to only 10 cents per capita, that no one would be benefited by its reduction.

6. That Australia now prohibits and for four years last past prohibited the importation of American merino sheep, and that it would be the height of folly to throw our markets open to Australia when she closes hers to us.

7. Therefore, the wool-growers of California earnestly appeal to their Representatives and to Congress not to bring widespread injury by reducing the tariff on wool, and earnestly appeal to their sense of duty to retain the present duty, felt by none, but without which the industry could not exist.

8. We heartily concur with the views expressed by the National Wool-Growers' Association and extend to them our hearty co-operation in their endeavors to protect the wool industry.

EFFECT OF THE TARIFF ON AUSTRALIAN WOOLS.—Washington, December 23d. The *Evening Critic* says: Consul George Griffin reports from Sydney, Australia, that the direct wool export to the United States for this year has been very small, amounting to only 14,000 bales from Melbourne and 169 bales from Sydney. The American trade with the Australian colonies is insignificant as compared with that enjoyed by Great Britain. This is believed to be due to the protective tariff of the United States, which excludes wool, the chief Australian product.

HORTICULTURE.

The Olive in California.

(Especially Reported for the PACIFIC RURAL PRESS.)

(Concluded from our last.)

The Black Scale.

Let me say a little more in regard to the insect pests or the black scale. It is necessary to commence when the trees are small. They should be gone over in the month of April, certainly not later than the 10th of May, and every little tree should be examined; and wherever is found one of these little black scale it should be picked off by hand, and in that way prevent their propagating on the tree. There is no way you can keep the scale in check so easily, so cheaply and so surely, as by picking them off by hand when they are small; and then if some trees happen to get a good many on them, I would thoroughly wash that tree, using a hand syringe, with whale-oil soap or a decoction of tobacco or caustic soda, one pound of caustic soda to four gallons of water. It would not pay in such a small way to make a kerosene emulsion so as to be sure not to let the insects start in the orchard. I will read you a report I made to the State Board of Horticulture several years ago on the subject of the insect to show you the danger before you:

"The olive is a rapid grower and bears abundant crops. It would seem to be the tree of all others that should claim the attention of the people, and its planting should be encouraged. There is yet, however, much to learn to enable the grower to keep his trees from the black scale. No other tree seems to yield so readily to the attack. The increase is so rapid and the insect is so persistent that it is yet a question whether in large areas closely planted it can be kept in check at a cost that the fruit will warrant."

I have no modification to make of that caution. I have spent a dollar to a dollar and a half a tree each year in fighting the black scale, and can only barely keep it in subjection at that. This black scale seems to have been created for the olive to make us careful, energetic and persistent—to keep us at work. While with the kerosene emulsion one washing each year will keep an orange tree, a lemon tree, or a lime tree free from the black scale or the soft orange scale, the olive tree requires two, three or four washes to have the same results. My orange trees are just as clear and clean apparently, that is to the naked eye, as though grown at Riverside, where they have no black scale at all. Of course there are insects there on the inside, but they are easily kept down by washing with the kerosene emulsion once a year. On the olive tree I confess I do not yet know the proper time of year to do this washing. For two or three years we had so much rain in the winter time that I could not get on the ground. Our wagons were so narrow in the tire and the ground so soft that there was no possibility of getting a washing apparatus over the field; but now I have wagons made with the tires six and eight inches wide so as to be independent of the soft state of the ground; and this year I am going to practice in the month of December, and in February washing with the kerosene emulsion to see whether it will not be more effective than it has been washing later in April and in August. The insects commence hatching in June. If they would all hatch out in June or in July, it would be an easy matter; but I have known them to hatch as late as the month of February. While simple washings will kill the little ones after they are just hatched, it will not affect those that are half grown; and if you defer the washing until after they are all hatched the first hatching is more than half-grown, has already formed its shell, and affixed to its place. That is the great difficulty with the black scale. It has but one brood a year, but that brood takes four, or five, or six months to appear upon the scene.

A Delegate: Does this particular black scale exist upon any other trees?

Mr. Cooper: It commits great depredation on the walnut in the coast counties, and I have grave doubts as to whether the apricot growers upon our coast will make a success unless they wash the tree; but wherever there is an olive tree, there you will find it.

A Delegate: How do you apply the spray?

Mr. Cooper: We use the San Jose nozzle mostly, because it is most convenient; but we discard the little tin with the opening, and substitute india rubber, so that if the sediment, not properly drained, gets in the material with which you are washing, it causes the rubber to expand a little and let it out. That is the best spraying apparatus that I have yet seen—a San Jose nozzle with a rubber diaphragm, which takes the place of the little brass plate on top.

A Delegate: What are the cuttings worth?

Mr. Cooper: I have been selling them for five cents a piece, one inch in diameter and fourteen inches long. The smaller I sell two for one, that is 2½ cents. That is the price they generally sell for us in Southern California, packed and put up in the proper manner and put on the wharf for shipping. Thinning out gave me a large number of cuttings last year. I thinned out one whole orchard that was 15 years old. I have another 15 years old that I shall partially thin out this winter.

A Delegate: You disinfect the cuttings?

Mr. Cooper: I disinfect everything. There is no trouble about the cuttings.

An Outfit for Picking.

Mr. Dwinelle: You have a peculiar apparatus for picking?

Mr. Cooper: Yes. I use a common ranch wagon with a platform on it that reaches up to the limb, and I drive on one side of the tree as close as the platform will permit, running under the tree so that the pickers can stand and commence to pick the lower limbs, while others can stand higher and pick higher. Then we have ladders fastened with iron bolts that lay up against the tree. We have the apparatus fastened to a canvas cloth that buckles around the body and goes around the neck with clasps, making something like a scoop, so that the pickers can pull the berries off with both hands. We do not care about having some leaves in with the olives, because we pass them through a very powerful fanning mill—the largest fanning-mill we can get for cleaning grain—to blow the leaves out, and doing that will take all the dirt out, and the olive comes out of the mill perfectly clean, ready for the dry-house. The pickers come in at night with the days' picking, and the first thing in the morning we have that cleaned and put in the drying-house. With a fair crop, averaging the whole season, a picker will average 300 pounds per day, so we calculate that as a fair day's work. I do not hire Chinamen by the job; I have them by the day, and my pickers all make a pretty good average. I tell them if they can't pick that many they will be discharged. They know we know how many a man can pick; an able-bodied man can pick 300 pounds a day. We pick them clean from the tree, beginning with the ripest tree and taking the others later. We take everything off, pick all the olives that are on the tree—green, red, and purple; if there are any green ones on it we finish them up.

A Delegate: At what stage of ripeness should they be picked for pickling?

Mr. Cooper: There are two theories. Some say before they turn red; others when they are entirely purple. For the pickling it is better for the ripe olive that they turn a purple color, but they have to be packed and handled with extreme care. We pick them in water—that is, pick them and drop them in water so they won't be bruised. We take into the field a tub with water in it and the pickers empty into that, so that there cannot be any bruising. Even in pickling them we handle them in the same way—that is, every day we handle them we handle them in water—and we aim, when we are changing the water, to get the olives that are in the bottom one day on top the next, changing the water every day, and in that way you will not find one that is not perfect.

Pickling the Olive.

Mr. Gray: How much salt do you put in?

Mr. Cooper: We buy the best Liverpool salt and boil. The first salting, after changing the water every day for 30 or 40 days, depending on the ripeness of the olive, we make a mild brine about half as strong as would bear an egg and leave it in that brine two or three days. Afterwards take the olives out of that brine and wash them in cold water. Then we make a brine that will just about bear an egg, always boiling the brine, and keep them in that for an indefinite period. I have kept them three years, and every olive that comes on the table is just as perfect, just as full, as when picked from the tree.

A Delegate: The first washing is in clear water?

Mr. Cooper: Yes sir. We do not wash them, we soak them. We keep them in water 30 or 40 days, changing the water every day.

A Delegate: You do not use lye?

Mr. Cooper: No sir. I never did. I never tried that method, though some do.

Miscellaneous.

A Delegate: How far apart do you plant the trees?

Mr. Cooper: Twenty feet each way.

A Delegate: Which do you consider the most profitable, pickling or making oil?

Mr. Cooper: I am prepared for making oil, and have only pickled a few. I should think there was more profit in pickling on a small orchard, but where you have 6000 or 7000 trees in bearing, you have enough to do without trying to pickle.

A Delegate: Is the refuse, after you have taken the oil out, of any value for any purpose?

Mr. Cooper: I have never made any use of it excepting to feed it to pigs. It makes excellent pig food. They use it in Europe to make what they call a third quality of oil. They pour it in a large vat and pour boiling water over it; it ferments, and the oil that is left is then liberated, comes to the top, and make a very good oil for burning.

A Delegate: Do you think there is more profit in olives than any other fruit?

Mr. Cooper: I couldn't answer that question. All I say to the audience is that I am planting olives, and not planting any other kind of fruit trees.

Mr. Butler: I have a place near Dr. Agard's of Auburn, and I have some 200 of the finest six-year-old trees. The conditions may be somewhat similar to Dr. Agard's. Mr. Cooper speaks of a comparison between the Picholini and the Mission. So far as I am concerned, I would give the preference decidedly to the Mission. They commence bearing about the same age, and while there are not many more on the Mission, the Picholini are so much

smaller, it gives a decided advantage to the Mission. The Picholini may be slightly earlier, but not much. We think the Mission is decidedly better.

M. Klee: From seeing the Picholini in different parts of the State, I was impressed that it ripened five or six weeks earlier than the Mission. I think that I observed it considerably earlier in Placer county, but, of course, Mr. Butler speaks from his own experience. Mr. L. A. Gould of Auburn sent me word that they ripen five weeks earlier than the Mission, ripe enough to make oil five weeks earlier than the Mission. While I am speaking about the Picholini I would like to call the attention of everybody to the fact that it is a very small olive. The impression has gone abroad that it is a very large olive, and a great many people, Mr. Butler, perhaps, among them, were misled into buying it, thinking it was a large pickling olive. It is not so; nor should the true Picholini be a larger olive. In Pomona I have seen the Picholini, and Mr. White of that place thinks quite favorably of it. He claims that while much smaller it bears fully as much as the Mission, and that owing to the more even ripening it is more easy to gather. It comes off the stem quite readily, and a man can very quickly strip the limbs of the olive. That is his experience there.

Mr. Flack: I have been trying to raise the Mission olives from cuttings in the nursery and I have failed to find any method by which I can get more than 10 to 20 per cent to grow. Those that have grown have got from 5 to 5½ feet in height. My cuttings were from a half to an inch and a quarter in diameter, and they were placed on the finest nursery ground that you can find in Sonoma county. They were put out in December, February, and March, and as they have been sawed for some time I took the knife and made a fresh cut, and they were on soil which would retain the moisture. I would like to know why I had not better success.

Mr. Cooper: What was the nature of the soil?

Mr. Flack: It is what you would call a willow bottom with sandy deposit. It was in a perfect state of cultivation, and pulverized.

Mr. Cooper: It is necessary when you plant olive cuttings that the ground should be thoroughly cultivated; it should not be wet; it should be warm. It is useless to plant out olive cuttings in cold ground.

Mr. Flack: This would be what you would call real good mellow ground. I cultivated it about two weeks to try to get it perfectly loose.

Mr. Cooper: I am asked about what time would be most favorable for the propagation of cuttings. I have recommended from the 20th of February, depending upon the season. I have found in watching the season the last few years that when we had considerable rain in the months of December and January that we were likely to have an earlier spring—that is, less rain in the spring—and in such a season I should plant earlier; but as we had two of three years ago, and I think two or three winters in succession, no rain till late in January, then the spring and summer rains lasted much later in the season, and necessarily would delay us planting. Under such circumstances it will not do to plant in March, or they will all rot.

THE VETERINARIAN.

Horse Disease in San Benito County.

H. Baker, M. R. C. V. S., of Hollister, has written the following account for the *Free Lance* of a horse disease which has recently shown itself in that vicinity:

There having been several cases of death among the horses in this vicinity in the last week or two, the symptoms of which during life were much the same, and as considerable doubt appears to exist in the minds of stockmen as to the nature of the malady by which they were affected, I have concluded to contribute a few lines upon this subject.

Among the horses thus taken off may be cited the celebrated Norman stallion "Milo," the property of the well-known horseman, E. J. Turner; also two valuable animals, the property of Mr. McCobb, and two belonging to Mr. McDonald—both of the latter gentlemen living in the vicinity of San Felipe.

Most unfortunately circumstances have prevented me from holding a post-mortem examination on any one of these animals, and, indeed, the only case really professionally attended by me is the one last cited, namely, that belonging to Mr. McDonald, and then I was not called in until about six hours before death, hence much that might have been made indubitable by an ocular demonstration was of necessity withheld from the owners. Having, however, seen hundreds of similar cases through life, and held post-mortem examinations on the same, I am by no means at a loss to lay a pretty accurate description of this disease before the public.

Having made these preliminary observations, it will now be necessary for me to speak of some of the diseases of the pleura and lungs, since I am fully convinced that not only in the cases cited, but in many that have of late proved equally fatal, these are the organs principally implicated, hence the following definitions:

The disease called lung fever (properly speak-

ing, pneumonia) is nothing more nor less than the inflammation of the substance of the lungs proper, and is classified as being acute, sub-acute, or chronic, according to the intensity of the symptoms and length of duration of the disease.

Let us take, for example, the symptoms of the acute, that is, the most aggravated form of the disease. This is generally ushered in by a day or two of apparent indisposition, but after the case once confirms itself the breathing will become very quick and short, the pulse exceedingly quick, the nostrils widely dilated, and of a fiery red color on their interior surfaces. The legs and ears grow deadly cold, the animal persistently stands until death carries him off, which may occur in from one to three days. In the subacute and chronic forms of the disease, the symptoms are much the same, only the breathing is not nearly as quick, nor indeed are any of the other symptoms so violent. In these latter forms of the disease the animal may live three weeks or even longer, and may, if subject to timely and proper treatment, recover altogether. In all three cases of these forms of pneumonia, the lungs will be found more or less broken down in structure, and in cases that have lived long, they will often be found almost totally decomposed. In such instances there is also a very offensive odor given off from the nostrils during life.

Let me now call your attention to the disease called pleurisy. That is an inflammation of the smooth, polished membrane that lines the internal surfaces of the ribs, and is from thence reflected upon the external surfaces of the lungs, heart, etc. This is a disease the symptoms of which I shall not describe, since none but the experienced veterinarian would be enabled to recognize them, and I merely mention it, because in all cases when this disease proves fatal, the chest will be found nearly filled with water, constituting a state termed hydrothorax. This disease (pleurisy) usually terminates fatally in about three weeks' time.

Lastly, allow me to call attention to a diseased condition called congestive pneumonia, or congestion of the lungs, for since the former part of this article was written, having been driven out by Mr. Robert Orr to hold a post-mortem examination upon a third victim of disease on Mr. McDonald's ranch, I am convinced that several of these cases have died from congestion of the lungs accompanied with ascites or dropsy of the abdomen. I have merely given the symptoms of inflammation of the lungs, in order that the public may be enabled to form some distinction between that disease and the one following, viz.:

Congestion of the Lungs.

The breathing is from the start quick and labored, the nostrils are widely expanded. As the disease grows worse, the respiration indeed becomes so labored that the animal appears to be suffering a sense of suffocation. The inner lining membrane of the nostrils will be found to present neither the pink hue of health nor yet the fiery red of lung fever, but to be of a dark leaden blue color, and in some cases almost black. The legs and ears become deadly cold, the animal stands with his fore-legs wide apart, the pulse is quick, small and oppressed, the breathing is now effected through the mouth as well as the nostrils, the animal persistently stands, exhibits a most anxious expression of countenance, rapidly sinks under his afflictions, and may die in from four to five hours. Such constitutes a description of a very aggravated case of congestive pneumonia, far more severe indeed than is generally met with, most cases lasting from one to four days, and presenting these symptoms in a much milder form. In a post-mortem examination of an animal that has died from this disease, the most marked appearances will be a very dark appearance of the lung or lungs affected, varying from a dark purple hue to a color almost black.

I have previously alluded to the disease termed ascites, or dropsy of the abdomen (belly), and in the post-mortem which I held last week on one of Mr. McDonald's horses, there must have been at least ten gallons of fluid escape from the abdominal cavity, and Mr. McCobb informs me that such was also the case in one of his animals, while the lungs in this case appeared to be but little implicated. Lastly, let me observe the dropsy of the abdomen where there is a large quantity of fluid present, may of itself, by its presence upon the diaphragm, and from thence upon the lungs, produce congestion of these latter organs. It now alone remains for me, sir, to express my opinion upon the cause of death in some of these cases, which is that two out of the three animals lost by Mr. McDonald died from congestion of the lungs, attendant with and possibly induced by the pressure on the diaphragm of a large quantity of fluid contained in the abdominal cavity, whereas in one case out of the two lost by Mr. McCobb, I believe the cause of death to have been dropsy of the abdomen alone. The other animal lost by these gentlemen I have not seen, but am much inclined to think the causes of death were similar.

Some people who have only given the subject half a thought have mentioned phosphorus or strychnine as possible causes of death, from the fact that these agents are contained in squirrel poison. Strychnine, however, occasions violent muscular spasms, while phosphorus induces partial paralysis, attended by a drooping and prostrate condition; none of which symptoms are visible, hence the fallacy of such an impression.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

New Year's Thoughts.

[Written for the RURAL PRESS by Mrs. J. M. K.]

As the old year draws to a close, I am reminded of a suggestion made, I think, by Mrs. Nichols, that the occasional writers for the RURAL give an account of themselves the past year. Surely, it would be interesting and profitable. If I were asked, in old-fashioned Methodist-class style, "How is it with your soul today?" though reared in a sterner creed, whose spiritual gauge was more duty well done than ecstatic feeling, I by no means ignore the latter, and could answer truly, "I've reached the land of corn and wine, and all its riches freely mine."

Instead of sympathizing in the feelings of one who said, "I have a perfect horror of old age," I find so far the years have brought compensations for what is lost of youth. I am happy to see so many expressing the same sentiment. I looked for an hour over some old files of the RURAL, to find again some sweet lines by Mallie Stafford. Not coming across them, the sentiment is still remembered, that our whitening hair was but a glory, shining down upon us from heights above.

The one shadow on my life is that my strength will allow me to do so little of all the work I see for hand and brain around me, though the spirit never was more willing.

Friends, let us know what you are doing; if you are thinking any bright and helpful thoughts, or even enjoy and appreciate those written by others. Send along the good word if you know of progress in any direction upward; or a note of warning where that seems necessary.

For my part, I can but say too fast when I hear predictions of a millennium at the door.

Intemperance, injustice, corruption, indifference where we might expect help convince me that not only the enlightenment of the world but the reforming of our own country is a task we will pass on to our great-grandchildren.

We are working in the temperance cause here the best way we know, and surely it is one of the most urgent reforms of the day. Lord Onslow's statement in the House of Lords should arouse the indignant zeal of every lover of humanity. He says the attempt to establish an international compact prohibiting the sale of strong drink to the South Sea Islanders had broken down owing to the refusal of the U. S. Government to enter into the agreement.

Humiliating that the responsibility for this crying evil is brought to our doors. Oh, the strength of the enemy intrenched behind Government ramparts.

But not for long. Recruits are rapidly pouring in. Among the hopeful signs of the times we notice an increasing space devoted to temperance literature in our newspapers. Even the RURAL and Patron are taking higher temperance ground, we fancy, not to complain of past shortcomings. Hurry up, brothers, as fast as you can; bring on the main part of your forces. Don't wait for all the halt or the blind, or the battle may be lost. We must leave these behind in hospitals, hoping they will feel better when the battle is won.

West San Joaquin Grange still lives, shining with a faint and steady light, that gives promise of continuance. A live public lecture might possibly revive Grange interest and add to our numbers.

The late rains have been abundant for present needs, and all seem full of hope and courage.

While we write the RURAL comes to hand, and glancing through its pages we are pained to note the death of another contributor.

One by one they pass on before us. Who will fill their vacant places?

Tracy.

POTTER VALLEY.—W. A. Grover, M.; Wm. Eidie, O.; J. J. Dashiell, L.; Chas. Carner, S.; Ira T. Spencer, A. S.; H. P. McGee, C.; F. M. Hughes, P.; W. V. Kilborne, Sec.; S. H. McCreary, G. K.; Miss May Eidie, P.; Miss Cynthia Dashiell, F.; Miss Emma A. Spencer, Ceres; Miss Addie Dashiell, L. A. S.; H. P. McGee, Trustee.

NOTE: The Secretaries of Granges are requested to forward reports of all election and other matters of interest relating to their Grange and the Order.

WHY is it, queries a Santa Ana correspondent, that there are no Granges in Southern California? We repeat his query: Why is this?

Debris from the Cherokee.

The following article, about the Cherokee injunction, appears in a recent issue of the *Sutter Farmer*:

We have watched the operations of the Cherokee hydraulic mines with a good deal of interest. First, because it was, from all accounts, a very rich mine; second, because it appeared to be owned and operated by honorable men; and, third, because the managers left nothing undone whereby injury to other property might be prevented.

That the reader may understand the situation clearly, we will refer briefly to the early history of the Cherokee operations, which, however, scarcely dates back more than 10 or 12 years.

As we understand it, Cherokee has no watershed and receives no water except what falls into the mine and is carried to it in ditches; hence no flood could occur as on the Yuba to overwhelm the country below. The nearest and most convenient outlet for the debris was Dry Creek, a small stream that was dry nine months of the year, and at no time ran sufficient water to find an outlet into any of the larger streams in the valley. Still, for a considerable distance from the foothills, in its course toward French Crossing, on Butte Creek, it ran through a well-defined channel between prominent and hard banks and then spread out over what are called "goose lands," or great adobe flats, covering them with water in winter, and, as they dried out in summer, they would crack open in great chunks, endangering the feet of animals passing over it.

This, then, was the conduit and dump for the debris from the Cherokee mines, and to show how effectual it was, we will relate a circumstance that happened to some hard-working young men, residing at the time in this vicinity. They secured a half-section of land at a low figure in the vicinity of the creek spoken of. They plowed it in the spring to lay over in fallow. When the first rains came it was sown to wheat, and soon made its appearance above the ground and made glad the hearts of our friends, for, to all appearances, a small fortune was in store for them. They continued to reside here until such time as they could make the needed improvements. So when spring came with its gentle showers and warm sunshine, bringing forth the harvest at a rapid rate, our friends took a drive to Butte county to view their prospect, when to their utter surprise and consternation, their 320 acres of land on which they had spent so much labor, and on which they had built their hopes, together with the crop, was wholly submerged with slickens from the Cherokee. The conduit was full and the slush spread over the plains.

The miners were probably little less surprised than were the farmers, and they at once paid for damages where claimed or purchased the lands outright to avoid litigation. But the slickens, like the batter, spread farther and wider, engulfing in ruin all it touched. The company could not buy the whole country, and so they decided to construct two huge levees from the mine to the Butte adobe flats and the Sutter tule basins, a distance of 25 miles, more or less, and between these it was expected to carry the Cherokee debris to a permanent basin where it would harm no one. It must be seen that this involved a very heavy expenditure of money and labor; and, having no rivers or floods to contend with, ought to have been in the power of man to control if such things are possible.

But the basin men did not relish the idea of furnishing a dump for other people. A suit was begun; an injunction followed, and then a lease of the dumps at so much an acre per year. For awhile this silenced litigation and secured peace to the mine, but the expense in time bankrupted the company and the mine fell into the hands of its creditors and laborers, who have for a year or more sought to get their pay back by working the mine. While this was in a measure successful, it could not add anything to the height of the levees or the security of the valley farms. Therefore the canal filled, and the destructive batter once more invaded private rights, and even an Oroville Court could not do less than enjoin the nuisance.

The experience of the Cherokee is a complete and overwhelming answer to every restraining theorist. With entire control of the water and restraining works, the Cherokee failed utterly to control its debris; how much less can our mountain miners hold their mud in the torrential streams? It is clearly impossible. And when the valley people consent to the experiment they will open their doors to the flowing mud. We can but regret the ill-luck of the Cherokee people, but their experience sustains our oft-repeated assertion, "That the power to restrain is not and never can be equal to the power to dissolve the mountain."

A STATE GRANGE WEDDING.—We learn from the *Patron* that W. Walter Greer, A. S. of the State Grange, and Miss Frankie Stevens, L. A. S., were married at Sacramento on the 20th inst. Both Brother and Sister Greer are also officers in Sacramento Grange. Best wishes!

BENNETT VALLEY GRANGE, with a few invited guests, held a Christmas festival last Saturday, with music, an address by Edwin Peterson, distribution of gifts, supper and social dance.

MERCED GRANGE has had an initiation at every meeting since State Grange.

Restricting Immigration.

U. S. Senator Cullom of Illinois, in a Fourth-of-July oration, said: This has been called the land of the free and the home of the oppressed. So it has been, so it is now; but it is not and should not be allowed to be the dumping-ground for all the paupers and criminals of other lands. The time has come when the bars of our country should be put up and fastened against such importation. It should have been done before now. We invite all to come with honest purpose to be law-abiding citizens, who can care for themselves and will labor for the upbuilding of good government. But we have no place for fugitives from justice, for dynamiters, or lawless characters of any class.

Senator Palmer of Michigan proposes the enactment of laws which shall enable well-disposed and worthy persons who desire to become resident citizens of the United States to obtain certificates of character and fitness therefor from the Consul of the district in which they reside, without hardship or unreasonable delay, which certificates shall contain, in addition to other specifications required by this Act or which may be prescribed by the Secretary of State, the full name of the individual receiving the same, the place of birth, age, occupation, last legal residence, physical marks or peculiarities, and all facts necessary for identification of such individuals; and providing that no certificate shall be granted to any convict, except those convicted of political offenses, nor to any lunatic, idiot, or person unable to take care of himself or herself without becoming a public charge, nor to any anarchist, nihilist, or any person hostile to the principles of the Constitution or form of government of the United States, nor to any believer or professed believer in the Mormon religion who fails to satisfy the Consul upon examination that he or she intends to and will conform to and obey the laws of the United States.

Whereupon the San Jose *Times* observes: Palmer's bill makes an exception in favor of persons convicted of political offenses. It is just the exception which ought not to be made, if there is any possibility of Red Flags getting in by virtue of a complaisant construction by some demagogic administration. A demagogue in a republic is about as dangerous as an out-and-out anarchist, and a great deal meaner.

The State Grange and Congress.

The Secretary of the State Grange, having sent each Senator and Member of Congress from California official copies of the several resolutions concerning national legislation which were adopted at the late session of the State Grange, together with a personal letter bespeaking their favorable attention to the recommendations embodied therein, has received acknowledgments and promises of consideration from Senator Stanford and Representatives Felton and Morrow. The last-named gentleman also says:

I have been for some time impressed with the view that the Geological Survey should furnish some information as indicated in the resolutions adopted by the State Grange, and last summer I had a conference with Professor Hilgard of the State University upon the subject.

After going over the matter very fully, it was determined to recommend the incorporation of the amendment into the "Sundry Civil Appropriation bill," providing for the employment of a chief agricultural expert, and such assistance as might be necessary to secure a classification of public lands, with reference to the agricultural development of the country.

These proposed amendments of the law have been prepared, and I shall offer them at the proper time. An appropriation for the agricultural experimental stations was unintentionally omitted from the bill providing for their establishment. I think there is no doubt but the necessary appropriations will be made at the coming session of Congress. In any event, I shall do what I can to secure proper legislation in that direction.

The patent laws undoubtedly require amendment, and I have been giving that subject some attention for the purpose of securing such legislation as will protect innocent purchasers and users of patented articles and implements.

I do not think that the Interstate Commerce law will be repealed. The indication is that there will be an effort to amend the statute for the purpose of making it more effective than at present.

All these matters will have my careful attention, and I beg leave to say that the recommendations of so important a body of men as compose the State Grange of California will receive the fullest consideration.

POSTAL TELEGRAPHY.—Washington dispatches state that Senator Sawyer, chairman of the Postoffice Committee, means to bring the subject of a postal telegraph before that committee very soon after the holiday recess. Mr. Powderly has sent the committee word that he would like an early hearing before them on behalf of the Knights of Labor in favor of the Cullom postal-telegraph bill, and he will be invited to appear soon after the reassembling of Congress.

BROTHER AND SISTER FLINT, our W. S. L. and his good wife, have been visiting Los Angeles. Santa Monica, Pasadena and other points of interest; and he writes with unenvied wonder of Southern California's marvelous development.

QUERIES AND REPLIES.

Ensilage.

EDITORS PRESS:—Can you inform me if there are any silos in use in this State? Do you know if alfalfa has been successfully cured in them? It is known that fresh alfalfa will give an unpleasant flavor to milk. Would alfalfa ensilage give the same flavor, or would the heating process through which it passes change it so as not to produce it? Shall look for a reply through the PRESS.—DAIRYMAN, Los Angeles.

Mr. I. R. Jewell of Petaluma has probably had more experience with silos than any other Californian. We published a letter from him on the subject in the RURAL of June 19, 1886, to which our correspondent is referred. Mr. Jewell has used alfalfa and other forage plants, but prefers corn if a man has good moist corn ground. As for the effect of ensilaging on flavor properties of alfalfa we are not informed. Will some reader answer the question?

Retention of the Placenta.

EDITORS PRESS:—My neighbors and myself are having considerable trouble with milch cows not cleaning themselves after calving. The cows are put in the stable every night and fed on hay and bran, and turned in the pasture in the day time. Northerly winds seem to aggravate the case. Can you or any of your readers tell what is the cure in such cases, and if there is any preventive?—JOHN H. EDEN, Nevada City.

What would our dairy readers advise?

Fastening Cows in Barns.

EDITORS PRESS:—Will some reader be so kind as to describe in your paper a good method of fastening cows in barns, other than with stanchions?—SUBSCRIBER, Petrolia, Cal.

Fruits for Tule Islands.

EDITORS PRESS:—I would like some reader of the PRESS experienced in the culture of trees, fruits and nuts to tell me if I had better plant prunes and walnuts; that is, whether I have the right kind of soil. I am located on the west end of Rough and Ready island. Is there any reader who has had experience in such land?—F. AND W., Stockton.

SCHOOL ENTOMOLOGY.—The new edition of Matthew Cooke's elementary work on entomology has just been issued by the publishers, H. S. Crocker & Co. of Sacramento. Its title has been changed to "School Entomology," to more nearly accord with the use to which the volume is now being placed as a textbook in our public schools, in accordance with the new law requiring such instruction. The book has thus far been adopted by the Boards of Education in nine counties, to wit: San Diego, Kern, Tulumne, Alameda, San Mateo, Solano, Sacramento, Sutter, and Plumas. Other counties have the work under consideration for action at their coming meetings. This book is the only elementary one we know of which is available for use by schools, and it will serve a very good purpose. Besides this, school libraries should be provided with several more advanced works. Cooke's "Insects Injurious to Garden, Orchard, etc.," gives the fullest information of pests likely to be encountered in this State. Packard's "Guide to the Study of Insects" is the best general work. These and many other advanced works as can be had should be procured for the use of teachers.

THE WHEAT DEAL.—The *Bulletin* says: All the creditors of William Dresbach and John Rosenfeld, the victims of the wheat deal of last summer, have signed the agreement reached on Friday last by which all are to accept \$150 on contracts margined down to \$1.70, and \$200 on those margined down to \$1.93. Chas. B. Stone, assignee of the defunct brokers, states that the Nevada bank, which is the heaviest creditor, signed the agreement on condition that the 13-16 of the ship Carrollton, and the 1 of the ship Willie Rosenfeld, belonging to the bankrupts, be transferred to it, and that it receive the \$25,000 balance due of a sum of \$100,000, which had been agreed on as an amount to be paid the bank. The ratification of this agreement practically closes the last chapter in the great wheat corner by which Dresbach, Rosenfeld and the Nevada bank between them lost \$6,000,000.

SAN JOSE AND THE AMERICAN HORTICULTURISTS.—At San Jose, on Friday, 23d inst., committees from the common council, board of trade, Grange, viticultural and horticultural societies, met in joint committee to arrange for the appropriate reception of delegates to the American Horticultural Association which is to meet there Jan. 24th. A number of subcommittees were appointed. Cyrus Jones, president of the local horticultural society, said all counties represented in the State Board of Trade had been invited to send exhibits and participate in a Central and Northern California citrus fair, to be opened here on the arrival of the Eastern horticulturists, and favorable responses enough had been received to insure the grandest affair of the kind ever held in California.

THE Pacific Land and Cattle Co. incorporated Dec. 17th, with R. M. Mover, J. H. Pennington, I. N. Day, T. C. Clifford and Henry Eckhoff as Directors; capital stock, \$2,000,000; \$101,000 subscribed.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

A NICE LITTLE ORCHARD.—Haywards Journal: C. S. King of San Lorenzo has ten acres planted to plums, cherries, prunes and one row of pears that has for three years past netted him \$200 an acre, or just \$2000 net each year. Clint paid for the place in three years, besides making a living on it. The highest this place netted was the year before Mr. King purchased it, when it reached just \$2700.

CHRISTMAS-TREES AND CUT FLOWERS.—Enquirer, Dec. 21: At the holiday season quite a business is done by some of the residents of the redwoods in supplying Christmas-trees. About 15 miles back of Oakland in the Moraga valley is a growth of redwoods from which most of the Christmas trees are brought. These are cut in proper size and hauled in large wagon-loads to the city, where they are stood along the sidewalk for sale. They are usually bought by the load by retailers. A load of redwoods brings from \$15 to \$20, according to the size and quality of the trees at first hands. They are retailed at from 25 cents for the smallest to \$3 for family trees, and \$5 and upward for the largest used by societies and churches. . . . P. J. Keller, the Piedmont nurseryman, has a standing order for two shipments weekly of cut flowers to Salt Lake florists. This week he received an additional order for \$10 worth.

Butte.

MULES FOR AUSTRALIA.—Chico Enterprise, Dec. 23: A Mr. Grady, representing an Australian railroad company, who came to Chico recently to see the stock ranch and animals of D. M. Reavis, says that the horses and mules on that farm are the finest in the State and cannot be beaten this side of Kentucky. He bought of Mr. Reavis 50 head of fine young mules, paying in the neighborhood of \$12,000 for them. In the spring they will be shipped to Australia to work on the new railroad now building there. The distance they are to be taken is about 9000 miles. This is a decided compliment to the Reavis rancho and the fine breed of animals produced by Mr. Reavis.

Fresno.

COUNTY PRODUCTS.—Expositor: "Cactus Ed" and Jim Waterman have excellent samples of some of the products of this county that are well worth the time to step over and see. They consist of figs, oranges, sweet potatoes and turnips. The first are of the White Smyrna variety. They are very large and show off splendidly. They were raised by M. Denicke. The oranges were raised on the Akers ranch, near Centerville, and are large and fine. The sweet potatoes can hardly be beaten. One weighs 35 pounds, while among the turnips a good showing is also made, one weighing 15 pounds.

RAMIE.—Frank Locan put out some 20,000 plants on his farm east of town this season. The capacity of the soil to grow the plant proved very satisfactory, and next season he will largely increase his acreage.

Los Angeles.

UNWONTED AND UNWELCOME.—Times-Courier, Dec. 17: The wind-storm which was felt in Pomona Tuesday night seems to have swept over the entire Pomona and San Gabriel valley, and reports of its disastrous effects have been received from Colton to Pasadena. Its general course seems to have been from north to south, though it resembled a cyclone in nature and blew from all directions alternately. The reports of the damage state that most of the buildings were wrecked near the hour of 10 p. m. The most mischief was done along the foothills, Pomona and the country a few miles further south feeling but a small portion of its original force. Ontario suffered more than any other place. The wind seemed to sweep out of the canyon to the north and descend directly upon the town. About 20 buildings were damaged in some way and a number were completely wrecked.

Monterey.

SAN LUCAS MATTERS.—Cor. Salinas Index, Dec. 19: So far we have had 1.70 inches of rain, and have no cause to complain so long as we fare as well as other sections of the county. Most of the more experienced farmers have entire confidence in the prospect ahead of them. It is gratifying to hear their hopeful tones. . . . M. Rizhetti & Co., from Cayucos, have rented 3000 acres from A. Trescony for dairy purposes. The tract has been divided into three parts, on each of which a substantial dwelling-house, dairy, barn and all necessary corrals, etc., have been erected.

San Bernardino.

THE LATE WINDSTORM.—Chino Cor. Bulletin, Dec. 23: It was truly fearful in many places and fierce in nearly all. Much damage was done and a few lives lost, but I have conversed with cool-headed men from all prominent parts since the storm, and am informed that unprecedented as it undoubtedly was, the damage is much less than at first believed. In the rush of construction, many buildings were put up hastily with timbers of almost any kind, and often by poor and careless mechanics. Hundreds were shells set upon stilts. The wonder is that more were not upset. The large hotels that went down, it is now admitted, were unfinished or of flimsy construction. These are the substance of the reports, and I believe them.

In this town a windmill and a tank went down and part of a shed roof was carried away. As to trees, they have been somewhat injured. More or less of the oranges and lemons were whipped off. The reports from about San Bernardino are that from five to eight per cent and at Riverside from 8 to 12 per cent of the crop was blown off, but these windfalls were mostly ripe enough to market, and hence the actual loss in fruit will be light. The trees in a very few places were stripped of their leaves. A small percentage was broken more or less, but very few were wholly destroyed.

Santa Barbara.

OLIVE ORCHARDS IN PROSPECT.—Lompoc Record, Dec. 17: The Santa Ynez Land and Improvement Company, owning the College and Jonata ranches, comprising 30 odd thousand acres, have sold over \$200,000 worth of lands within the last 30 days and the demand is increasing daily. The fine olive orchards and vineyards, now so promising, leave no further doubts about the value of those lands for these profitable industries. There are 100,000 olive trees already out and the area to olives will more than be doubled the coming winter.

Santa Cruz.

CROP SALES.—Pajaronian, Dec. 22: Local buyers inform us that the bean crop is almost entirely sold, the potato crop is pretty well closed out, and the apple crop is almost entirely in the hands of the big shippers. The grain crop remains. But for the fruit and summer crop production of Pajaro valley the past season there would have been a repetition of the old cry, "hard times." The grain harvest was one of the best for several years, but it is unsold. The introduction of the sugar-beet industry adds one more product to Pajaro valley's long list, and further assures our farmers of relief from coin scarcity.

Shasta.

OBSERVED IN AN ORCHARD.—Redding Free Press: A visit to J. McCormick's orchard last Thursday was refreshing—persimmons, ripe and juicy, oranges, Washington Navel and Mediterranean Sweets, the former being the only ones of that variety grown in this section; California walnut trees, all bearing, and roses in full bloom. We were accompanied by Mr. J. W. Day of Minneapolis, who is making a tour of the State. He has been traveling principally in the southern counties, and from what he heard there of the northern part of the State is astonished at what he now beholds.

DRIED PRUNES.—Sherman Keneker of Clover Creek sent us a bag of very fine dried prunes, put up especially to show what can be done in that section of the county. The prunes are of good size and seem sweeter than those imported from other sections of the State.

Sonoma.

LATE PLUMS.—Sonoma Index-Tribune, Dec. 24: S. H. Shaw made a shipment of plums of the Coe variety to S. F. last Thursday morning. Many tables in this valley will be supplied on Christmas day with grapes, plums, raspberries, oranges, lemons and other fruits. These are grown in the open air and for flavor and size will challenge comparison with the most favored counties of California.

Sutter.

ORANGES AND FLOWERS.—Cor. Sutter Farmer: Francis Gibson, who resides one and a half miles below the junction of the Feather with the Sacramento river, in Sutter county, raises on his place the finest of Mediterranean Sweet oranges. He had boxed up some, and also prepared a miniature flower-bed, set out with flowers of great rarity and beauty, raised by Mrs. Gibson, intending to exhibit them at the Oroville Fair, but to their disappointment they were informed that the fair was only for Butte county products. Mr. Gibson is cultivating the best of semi-tropical fruits, and Mrs. Gibson the choicest and rarest of flowers. I hardly think a prettier flower-garden is to be seen in Sutter county. They have cultivated the useful to that extent that they now can cultivate the beautiful.

Trinity.

SHEEP LICENSE.—Humboldt Standard, Dec. 15: At the last meeting of the Board of Supervisors of Trinity county an ordinance was passed for sheep-owners to pay a license in accordance with the number of sheep owned. Bands of 5000 sheep must hereafter pay a license of \$250 per annum; 4000 must pay \$200; 3000, \$150; 2000, \$100; 1500, \$50; and 500 must pay \$25. Owners of more than 5000 sheep will be required to pay \$50 for each additional 1000. It is intimated that the supervisors of Shasta county will enact a similar ordinance. Trinity is a large county, and although a goodly portion of it is covered with the finest sugarpine timber, excellent pasturage is afforded. But there are bald hills and ranges, well supplied with water, which induce residents of other (principally valley) counties to drive their flocks there to feed during the summer season. It is possible that this fact may have induced the passage of the license ordinance above referred to. Most of the land in that county is still unsurveyed and unclaimed, owing to its isolated location and long remove from any market for its fruit, vegetables and other products.

Tulare.

THE BERRY STEAM FLOW is in operation every day on the plains southeast of Visalia, and works to perfection, turning 20 furrows at a time. The only fuel used is the straw that was left on the field from last season's harvest. Several thousand acres will be plowed with this

machine the coming season, and the same engine will supply the motive-power for harvesting.

MORE SHORTHORNS.—Visalia Delta: W. H. Blain purchased in Sacramento last week ten Shorthorn heifers imported from Cook county, Illinois. They are splendid-looking animals and will be a valuable addition to Mr. Blain's herd.

ACTUAL RETURNS.—Hanford Sentinel, Dec. 22: The following is a statement of the actual sales of fruit and cereals from the 40-acre ranch of H. C. Sutton, one mile east of Lemoore:

Early plums and apricots	48 00
Dried apricots	843 00
Dried peaches and pears	653 00
Green grapes	55 00
Green apricots	25 00
Raisins, 950 boxes, sold in S. F.	1330 00
sold at home	28 00
Fruit raised on 16 acres	\$2892 00
Hay sold	243 50
unsold, 30 tons at \$5.00	150 00
Corn sold	150 00
	\$3475 50

The following is a statement of the proceeds of O. C. Brown's ranch $1\frac{1}{2}$ miles east of Lemoore. The land farmed consisted of about 30 acres, but the products as given below came off of about 20 acres, about 10 acres of the ranch not being in good bearing:

Early peaches and apricots	\$ 75 00
Ripe peaches, 10 tons, \$20 per ton	200 00
Ripe peaches, 5 tons, \$40 per ton	200 00
Dried peaches	240 00
Dried apricots	640 00
Raisins, 510 boxes	714 00
Grapes sold	62 00
Apples, green and dried	157 00
Pears	126 00
Blackberries, 1 acre	337 00
Dried fruit of various kinds	47 00
Grape roots, 1 acre	800 00
Watermelons	177 00
Grain hay, 10 tons	100 00
Total	\$4575 00

The above statements can be relied upon as correct.

Ventura.

EDITORS PRESS:—Work has commenced here in earnest. In every direction can be seen cultivators at work, or clearing the few remaining fields of corn-stalks, preparatory to an early cultivation. Corn-shelling has begun, and the yield is turning out much heavier than was expected. A cool east wind blew quite hard last night and to-day, but to-night its wild invasion into our otherwise quiet neighborhood has ceased, and it seems like a calm after a storm.

San Buenaventura, Dec. 21st.

POTATO PROFITS.—J. B. Alvord, in Ventura Democrat: From seven acres the present season, I have taken about 840 centals of potatoes, or an average of say 120 centals per acre. The cost of producing and marketing exclusive of taxes and interest on value of the land was about 32 cents per cental; the average price for carload lots has been about 75 cents per cental, leaving a profit of 43 cents or something over \$50 per acre. In former seasons, some of my neighbors have done equally well and better. Of course the market heretofore has been very limited, but since the advent of the railroad there seems a ready market for all our surplus product. The above results were secured without irrigation, and there is a great deal of land in the county equally well adapted to the same purpose. On dry upland and heavy soils, especially in localities remote from the coast and its summer fogs, only early potatoes can be raised to advantage. But in those parts of the county combining suitable soil and climate I think a profit of \$50 per acre is rather below than above the average.

Yolo.

MERRITT ISLAND RECLAIMED.—Record-Union: Merritt island, 20 miles below Sacramento, on the river, in Yolo county, containing about 5000 acres of the best land in the State, has just been reclaimed as swamp land by numerous parties at a cost of \$25 per acre. Fruits, vegetables, alfalfa hay, and dairy products are raised on the island. A large warehouse and a steamboat landing are soon to be erected on the lower end of the island, and the farmers have awakened to new energies, and are improving and beautifying their homes.

A FINE JACK.—Woodland Democrat: Dr. H. P. Merritt had another of his fine jacks in Woodland to-day for the purpose of having him shod. He is not so large as some of the kind, but is very strongly built; and we have never seen a jack that had better legs or bigger ears, which are two of the best points in such animals. Dr. Merritt has eight full-grown jacks and about as many young ones.

ARIZONA.

LEADING THE WATERS ONWARD.—Phoenix Herald: The Highland Canal Company has filed articles of incorporation, with a capital stock of \$100,000. The gentlemen incorporating are Austin Carrington, T. J. Butler and J. F. Meador. The location of this canal is one mile south of the head of the Arizona canal and three miles north of Mesa. Gradually the boundaries of the rich Mesa country are encroaching on the desert, and no doubt, at some future time all the vast plain between the Salt and Gila rivers will be covered by canals. In evidence we cite the remains of the old Montezuma ditch, along the course of which the modern Mesa ditch threads its way into the plain. Beyond the present length of the Mesa canal, some 10 or 12 miles from any visible water supply, there are remains of the habita-

tions of the pre-historic races that tilled this magnificent valley.

SWEET POTATOES.—Schultz & Franklin have on exhibition in their real estate office a sweet potato that weighs 20 pounds, actual weight. It was raised at Mesa City, and is the heavy-weight champion of the Salt River valley. Mr. Ingalls has a number of sweet potatoes that weigh 14 or 15 pounds.

OREGON.

EDITORS PRESS:—Thousands of fruit trees will be set out this fall and next spring in Southern Oregon. Plowing is the order of the day in Wasco county. The farmers of Douglas county will be able to plow almost anywhere in the valleys now, and are busy seeding. Stock is in a fair condition to withstand the rigors of winter. Large immigration is expected from the East. . . . Not less than \$10,000 will pay the damages of the tule fire at La Grande. One man lost \$10,000 worth of hay. . . . Stock in the region of The Dalles is in poor condition to withstand the cold winds and snows of the winter, and little grass on the hills. Snow on the Siskiyou is two feet deep. Coyotes are numerous in the foothills of Polk county. Snow has fallen to a greater depth than ever before at this time of the year in the Pine and Eagle Creek mountains. Sixty miles south of Coeur d'Alene, on St. Joseph's river, snow was six inches deep and ice three inches thick the 3d inst. (Snow fell to the depth of 33 inches in this country last winter.) . . . Some damage was done dwellings and out-buildings in and around Portland during the wind and rainstorm of last week. . . . Grading in the mountains above Mehama has stopped. As a consequence the county is infested with tramps. Farmers should extend them neither pity nor charity, for these fellows almost to a man spend their money at saloons, then go out among farmers and beg for bread. —H., Turner, Ogn., Dec. 21st.

WASHINGTON TERRITORY.

ARBOR DAY RECOMMENDED.—Walla Walla Union: Gov. Semple asks the Legislature to appoint an "Arbor Day," most of the States and Territories having established them with good results. He says: "On this day, which is announced by executive proclamation, as is Thanksgiving day, the people are expected and encouraged to plant trees, shrubs and vines. Lessons are taught the children in the public schools as to the effect of forest denudation upon atmospheric phenomena; pictures are drawn of countries where at this time there is nothing but sterility, but where ruins exist that denote that at no very distant period the country was rich, fertile and prosperous. Each child is taught by the schoolmaster, and the fact is brought home to the attention of the people on Arbor Day, that whosoever plants a tree or shrub, or consigns a seed to the earth, is doing a mite to avert such a fate from his own country. Thus, in addition to the mere utilitarian idea, there occurs a cultivation of the gentler sentiments, which we as a people have been accused of neglecting, if not ignoring, in our eager pursuit of wealth."

SUSPENDED.—As we go to press, on Wednesday afternoon, the suspension of George W. Meade & Co., the well-known dealers in dried fruits, etc., is announced. It is hoped that the trouble is only temporary, and some business men who know Mr. Meade express confidence in his being able to extricate himself if he has time. It is stated that his debts are almost wholly to banks and not to producers.

SAYS the Shasta Courier of Dec. 24: Shasta oranges are now commencing to ripen. One tree in the grounds of Mrs. D. H. Dunn stands 15 feet high, has a spread of 14 feet, and the 20 props under the tree are strained to keep the main branches from breaking under the heavy load of fruit which ladens every limb from the ground up.

THE ORANGE CROP.—All reports seem to agree as to the excellence of the coming orange crop in the southern counties. The Pomona Progress names 2200 to 2500 carloads as the probable output, against 1600 carloads last year.

THE Water Storage Co.'s dam at Water Grove, A. T., 30 miles south of Prescott, when full holds 500,000,000 gallons of water, which is to be used on the desert 20 miles south of Prescott and for placer mines.

GRAPE-GROWERS should not forget the meeting of their State Association, which will be held in the Grand hotel in this city on Tuesday, January 10th, beginning at 11 a. m. Matters of importance will be up for consideration.

THE Placer County Citrus Exhibit in Los Angeles has attracted a great deal of notice and excited much admiration on the part of both Easterners and Southern Californians.

DANIEL MANNING, ex-Secretary of the Treasury, whom ill-health lately compelled to resign his position in the Cabinet, died at Albany, N. Y., Dec. 24th, aged 56 years.

SUFFICIENT capitalists have subscribed for the stock in the Woodland Woolen-Mill to assure the success of the project.

FRESNO and Los Angeles are pestered with petty pilferers.

A New Year's Song.

The world is full of mystery
Which no one understands;
What is before our eyes we see,
The work of unseen hands;
But whence, and when and why they wrought,
Escapes the grasp of human-thought.

There was a time when we were not,
And there will be again,
When we must cease and be forgot,
With all our joy and pain,
Gone like the wind, or like the snow
That fell a thousand years ago.

We live as if we should not die,
Blindly, but wisely, too,
For if we knew Death always nigh,
What would we say or do
But fold our hands, and close our eyes,
And care no more who lives or dies?

If death to each man in his turn
Is coming soon or late,
Be ours the soldier's unconcern,
And his courageous fate;
Better to perish in the strife
Than to preserve the coward's life.

Before my heart's fire pondering long,
As 'twere a bivouac,
I heard last night the solemn song
Which I had summoned back,
It seems my somber mood to cheer,
And is my greeting to the Year.

New Year, if you were bringing Youth
As you are bringing Age,
I would not have it back; in sooth,
I have no strength to wage
Lost battles over, Let them be.
Bury your head, O Memory!

You can bring nothing, all surprise,
And nothing but dismay;
No tears again in these old eyes,
No darkness in my day,
You might bring light and smiles instead
If you could give me back my dead.

I have beheld your kiss, New Year,
Full fifty times, and none
That was so happy and so dear,
I wept when it was done,
Why should we weep when years depart,
And leave their ashes in the heart?

Good-by, since you are gone, Old Year,
And my past life, good-by,
I shed no tear upon your bier,
For it is well to die.

New Year, your worst will be my best;
What can an old man want but rest?

—R. H. Stoddard.

A New Year Prayer.

The Christmas moon rides bravely in the skies;
The young and untired year is at the gate.
We tremble at his aspect, grave with fate;
At his inscrutable, unsmiling eyes,
Subtle with hope and full of prophecies.
Lord, he is all unknown, but Thou art true;
As in the old year, guide us in the new!

The clock has struck; with the last clanging knell
Comes in the new year, goeth out the old;
To-morrow is to-day, to have and hold;
The future binds us with her mystic spell.
For bliss? for bale? what man shall ask or tell?
Forward we look with wistful, questioning eyes;
Lord, who art wisdom's fountain, make us wise!

The old year's love shall live on in the new,
But love is weak and ignorant and blind,
Led by each wandering fancy of the mind,
Enticed by song of bird and scent of dew,
Misleading still where fain it would be true.
O Lord, whose love fails never night or day,
Teach us to love in Thine own perfect way!

That comes to end which now is just begun,
To wax, to wane, it is the common fate;
The new year must be old year, soon or late
The hovering shadow wrappeth every one,
And hides him from the day and from the sun.
Darkness and light are Thine, O Lord, most high;
Make us content to live and glad to die!

—Congregationalist.

Our Club of Four.

A Tale for the Holidays.

[Written for the RURAL PRESS by MRS. RANCHER.]

Thorndale is like 50 other farming districts in the San Joaquin valley. Its houses from a quarter of a mile to a mile apart, with nothing striking or original about them. Its schoolhouse the only public building, devoted not only to secular education, but religious as well; and also on occasions to exhibitions and merry-makings. Its scenery a long, almost unbroken stretch of waving grain or parched stubble, or rich, brown fallowed lands. How humdrum! you say.

Doubtless; but if the surroundings are commonplace, the inhabitants are not.

The settlement had been started by three families from New England. Old neighbors, with a regular New England raising; they brought

their love of religion, of education and of social intercourse with them.

The first addition was of two German families. These, finding a hearty welcome extended them, were no less hearty in their response. They helped with the Sabbath-school, joined in the festivities, and proved in the evening rehearsals for singing that Germans have not only a voice and love for music, but a thorough knowledge as well. After that came a family from Missouri, three or four from the mining counties, but the old social spirit had never died.

So the young people grew up; and finding a genial atmosphere of life and fun, as well as good morals, had given but little trouble about wandering in by and forbidden paths.

Among other social interests, the young ladies of the neighborhood, all of whom belonged to a Bible-class conducted by Mrs. Ainsworth, had formed a Y. W. C. A. with a regular monthly meeting; and four of the number, whose homes were near each other, had an informal weekly meeting at their teacher's house; and these meetings had so often been productive of good that the girls were familiarly spoken of as "Our Club of Four."

Bertha Sevensen was a quiet-mannered girl, with a frank face and intelligent look, that gave weight to her words wherever she was; while her particular friend, Lizzie Westbrook, was only saved from being a regular rattlebrain by a most judicious mother and an excellent bringing up. As it was, her love of fun led her into many a scrape, and many more Bertha's good influence kept her out of.

Georgie Brooks was the beauty of the quartette. Every one acknowledged the charm of her sweet, young face, with lustrous brown eyes, a skin so clear one seemed to see through it, and made no exception even though the shining braids she kept so smooth were undeniably red. "I can't afford to let my hair get disorderly," she would say; "you would say it looked redder than ever if I did."

Christine Harvey was often spoken of as "a real good girl, but so hard to get acquainted with." It was quite true that she had a distant manner that kept strangers from liking her, but Christine's friends if few were very warm ones, and ever ready to stand in her defense.

The four were assembled as usual one cold, gusty November night, in Mrs. Ainsworth's pleasant sitting-room, before the hospitable wood fire that could always be found whenever a chill evening wind gave the least pretext for such cheer.

Christine sat thoughtfully in an old-fashioned, high-backed chair, gently swaying to and fro, with a dainty touch of her slender feet that was grace itself.

Lizzie Westbrook had curled herself up on the hearth rug, looking almost as puffy-like as the tabby that purred under her gentle stroke; while Mrs. Ainsworth, in her low easy-chair, with Bertha and Georgie on the lounge, completed the group.

"I've been thinking 'since Sunday,'" began Georgie, "of Mr. Stone's sermon and the text, 'For the poor ye have always with you,' scarcely seems to apply to us. We really have no destitute among us."

"It is indeed true," assented Christine, "and the poor in the cities whom we read of seem so far away, one is apt to neglect giving altogether."

"Perhaps," suggested Mrs. Ainsworth, smoothing her hair thoughtfully with the shining needles that had been busily glancing in and out the bright wool sock, that was assuredly meant for some tiny foot, "perhaps there is other poverty than that caused by the lack of money. There's Mrs. Montgomery with her flock of little ones and her one armed husband. Doubtless his pension, with what he earns, leaves them no lack of daily bread; but I fancy she must often be weary for the lack of a quiet hour. Here is a case of poverty of leisure. Then there is poverty of health, even here in our lovely California. Many more cases I might mention, and we are not to excuse ourselves, even though the poor do not clamor at our door."

"Say, girls," exclaimed Lizzie impetuously, "let's see how much good we can do this Christmas tide. Let's postpone our next meeting until the new year, and then compare notes, or will that be disobeying the command, 'Let not thy left hand know what thy right hand doeth.'"

"Surely not, if we have the right spirit, and relate our experience for mutual help and improvement; and I trust my girls will attempt no good work to be seen of men. But there is one error," continued Mrs. Ainsworth, "of which I would warn you. When one undertakes any outside work, it is very natural to grow so interested in it, one is apt to neglect the old home duties, that are often irksome. Nevertheless these duties should not be neglected, should indeed come first."

A busy season followed. Intent on really accomplishing some special work for the Master, and yet remembering their leader's warning as to home duties, made this always busy group more busy than ever.

To them, time no longer rolled round, it flew; and ere they were aware the new year brought them together once more. It was long before the merry gossiping crowd could settle themselves down to anything like serious conversation; and Mrs. Ainsworth, whose success as a teacher lay partly in the real, not forced interest she felt in the young people, listened with a sympathetic smile to the oh's! and ah's! the interrogation points and exclamations, and

dasches, which even our sensible girls are apt to scatter so thickly through their sentences. After a time, however, they settled down quite contentedly to their favorite places, and the eager faces grew sober as they reviewed their month's work.

"Well, Lizzie, how is it that our little girl who is generally so ready has nothing to say?" queried Mrs. Ainsworth.

"I was so anxious to try missionary work, and I was so sure I could do something grand. That very night when I got home papa said: 'Well, Lizzie, girl, the old year's drawing to a close, and I would like you to go over all the accounts with me, that we may have a clean page to begin the new year with.'"

[Mr. Westbrook was blind, and Lizzie, the only child, was his book-keeper.]

"It was well you warned me, Mrs. Ainsworth, for book-keeping just then seemed prosy work, I assure you. But forewarned, you know, so I tried to speak cheerfully; but papa's ear is very acute to detect any false ring in one's voice, and he said at once: 'What is it, daughter? have you some plan for the holidays, some visit, or company, that you want your time? I suppose old folks forget that business is often dull music for young ears.' I had got my own voice by that time, and, besides, just then I had an idea.

"Oh, papa!" I cried, "how quick you caught me. Yes, I have a plan, but it is neither a visit nor company. And I'll make a bargain with you. I'll give four hours a day to the books if you'll give two to my project."

"I can promise that, I suppose, if it comes within the range of possibilities. Seems to me I remember some of your plans, though, that would have been more suitable for a monkey to assist in than a blind papa."

"Then I told him, and he really held to his promise, though since his sickness he has been so secluded.

"During this month we have been to see the sick folk far and near, and many times, though to tell the truth my part has been very small. But for papa, I never knew he had such a gift! He can quiet even a baby; and once when we were at Grandma Reed's, and she asked him to pray, he did, though I never knew papa to take part in meeting in my life. I believe everything I did was in the cooking line. That's shamefully prosaic, I know, but it seemed to be all I could do. The babies cried when I held them, and the grown folks liked far better to talk to papa. But once when I was sick I thought a deal of what I might and what I might not eat. So it seemed as if that was better to do than nothing. Besides, I believe I have a gift for that. You should see how sick people relish my baked apples and roast potatoes and broiled meats. You ought to hear them praise my gruels, and declare that no one else can cook an egg so 'just right.' It isn't much, but it's better than no gift."

Lizzie stopped to catch her breath.

"And whosoever shall give to drink unto one of these little ones a cup of cold water only in the name of a disciple, verily I say unto you, he shall in no wise lose his reward," quoted Mrs. Ainsworth, with a tremor in her voice, while pussy rubbed her soft head on the little brown hand, as if to testify her approval.

"I knew how it would be at our house," said Georgie Brooks, who had four younger brothers and sisters.

"That night when Mrs. Ainsworth spoke about home duties, it came into my mind, like a picture, that between the housework and the children there would be but little time for any systematic kindnesses. Then, in the midst of my perplexity, there came work right to our door. It wasn't very promising, and I don't know that we have accomplished much; but the next day after our meeting father came in with such a queer look. 'Maw,' he said (you know father always will call mother 'maw') 'a man came to me for work to-day. Says he lost his wife coming here; died on the cars; has five children. If I hire him he'd like to know if there is no cabin on the place where they could live and he with them. You see,' he added, 'I reckon I shall need but one man this winter, and if we make this arrangement we could be by ourselves without any hired hand.'

"But mother hesitated. 'There are the two lots of children to be considered,' she said. 'Where did you say they came from, paw?'

"From Missouri," he answered, "and I reckon if you were to hear him speak, you wouldn't doubt it."

"That settled it. Mother couldn't resist any one from Missouri; but she said to me that she would begin, as she could hold out. 'My duty is to my own children first; and if we find these little ones well behaved it will be easier to grow more familiar than to check familiarity once begun.' Then I told mother of our plans, and that perhaps this was my work; and she promised to help me all she could. So we've begun. But I fear we should have made but small headway had it not been for our Christmas-tree. However, we need not have been afraid of undue familiarity, for they seem to have a shell into which they draw whenever a stranger comes about. But I could see that they had been taught obedience, so by degrees we let our children get acquainted. Well, our youngsters wanted a Christmas-tree. I agreed to help if they would invite the little Hamiltons, and each one provide one present, and we asked them to help in the same way; all the presents to be home-made.

"And what do you think we had for the tree itself? A fir? Oh, dear, no. You remember,

that oleander mother has in a great barrel? It has never been set in the garden though it stands a good 10 feet high, and it's just covered with blossoms. Father and the boys moved it in the house for us, and Sue washed the leaves so carefully; Bessie Hamilton cut long, slender strips of cotton batting, and we laid it along the branches to simulate snow. Perhaps snow and oleander blossoms do not chime, but they looked sweet. We gathered oranges from our own tree and suspended them like golden balls. The walnuts and almonds also came from our own trees, and the raisins we had cured ourselves from our vines.

"Mary Hamilton is a right womanly girl, and has won mother's heart. Mother had her at our house, and taught her to make three kinds of candy; chocolate drops, nut candy and taffy. Some of the presents, too, were real ingenious. I think soon we shall be able to coax them into Sabbath-school, though they are very diffident. Odd, too; one of the little boys said to me, yesterday, in his queer drawl, 'Paw says you'd be a right peart gal if yer hadn't sech farnal red hair.'"

A shout of laughter greeted this, and then Mrs. A. turned to Bertha.

"About two months ago," she began, "a new family rented the old Robinson place. They sent for mamma once, when the baby was sick, and I drove her down. There was a roomful of little ones, and a girl about my age, who seemed to have all the care. The father and mother seemed very rough, and there was such a smell of whisky! But the young girl, Margaret—well, all I could think of was the old saying, of a dove in a hawk's nest. She is a half-sister only, but she seems to take all the pains possible with the little ones. She has been at our house several times, still, we get on but slowly. Mamma did the best thing. She made us each one of those neat walking jackets that are so stylish. Mine is gray, Maggie's brown; and the way she gave them to us, Maggie couldn't refuse. 'You two girls get on so nicely,' she said the day after Christmas, 'I thought you would be pleased to have these so nearly alike.' Maggie could see it was a surprise to me, and one can't say no to mamma. That's all I've done."

"And now, Christine," said Mrs. Ainsworth.

"Well, girls," responded Christine, "I thought for days what I might do, but Grandma is so feeble this winter, and she clings to me, I can't leave her but for a short walk. I wouldn't be here to-night but that Aunt Lou came up to-day, and she will stay till to-morrow. One day I was reading to Grandma, and I came across an article respecting the 'Shut in band' as they called themselves. So through this medium we got up quite a correspondence (for I told Grandma about it) and it has interested her and done her so much good. Sick people have few interests, and what they have is principally with the well ones, whose lives seem so far removed oftentimes.

"There was one poor girl who has been sick a long time with hip disease. She does fancy work for her living. We hunted bits of silk and velvet and ribbons for her crazy patch work, and Grandma enjoyed looking them over and telling me their history."

"There was a middle-aged lady who had broken her leg, but could sit up and knit. Grandma has had flannels knit for all of us, and the poor woman is busy at it yet. Then, there is an old lady like Grandma, who can only lie still and wait; and they enjoy each other's prayers and letters most of all." Christine paused and the tears fell as they all realized how soon Grandma Reed would be with them no more. "I have seen merrier times at Christmas, but never happier. There has been a satisfaction in doing even a little for others that I never had before, and I think after this our club had better take this for its motto: 'For even Christ pleased not Himself.'"

Chaff.

PROBABLY of all sensational developments boils are the worst.

SOME people are so sensitive that they seem to have corns all over them.

SOME men find fault because they are never lucky enough to find anything else.

THE great trouble with men who borrow from Peter to pay Paul is that they don't pay Paul.

THIN soup, according to an Irish mendicant, is "a quart of water boiled down to a pint to make it strong."

"MAMMA," said a little boy, as he left his bed and crawled into here one night, "I cango to sleep in your bed—I know I can; but I've slept my bed all up."

HE had evidently studied history.—She—"Freddie, how often have I told you not to play with your soldiers on Sunday?" He—"Yes; but, mamma, this is a religious war."

"You must not do that, my dear," said a mother to her four-year-old daughter. "Nice little girls never do so." "Yes they do, mamma, sometimes; didn't you just see me do it?" was the bright retort.

IN every human being there are many grains of gold. When one is down, even by indiscretions of his own, do not stoop to throw additional mud upon him. Strive rather to reach him a helping hand to extricate him from the mire in which he is wallowing. This is true manhood.

YOUNG FOLKS' COLUMN.

Eva Richards' Adventure.

A New Year's Story.

[Written for the RURAL PRESS by GEORGE MCLENNAN.]

"Oh, I do wish she would come." These words were impatiently uttered by a young girl as she looked for the tenth time down the muddy street. It was two days before New Year's and Eva Richards looked forward with pleasure to spending the remainder of the old year in the country home of her friend Bessie Lorane. As long as either could remember, Eva Richards and Bessie Lorane had been inseparable friends; for years they had been neighbors, until the death of Mr. Richards called his family to the city, where they resided at the time this story opens.

"I knew some of them would come," and Eva hurried on her cloak and hat as the kindly face of Mr. Lorane appeared at the gate. After inquiring for "the folks" and leaving the widow a kindly remembrance of the season, he helped Eva into the carriage and they soon started for home. She was so excited that she almost forgot to say good-by to her mother, and paid little heed to her parting words. Neither knew how much was going to pass before they met again.

Farmer Lorane's horses were noted for miles around for their speed; but to-day they could only plod along the muddy roads, and the cold wind brought the roses to Eva's cheeks long before they reached their destination. After what seemed to Eva a long time the hearty "Whoa" of Mr. Lorane indicated that they were home.

Eva sprang from the carriage and was half-way up the gravel path before he had time to help her out. With a good-natured laugh and "A mighty spry girl that," he drove on to the barn, where Bob and Bill were soon enjoying a liberal supper of hay and oats, for the kind-hearted farmer treated all dumb animals well. Eva's quick steps soon brought her to the veranda, where they were all waiting to welcome her. A hearty kiss from Bessie and "Well, well Eva, glad to see you; seems like a month of Sundays since your genial countenance greeted my eyes," and after delivering this burlesque welcome, Tom Lorane went whistling off to the barn to help with the chores.

"Oh, I am nearly frozen, the wind was so cold riding," and Eva led the way to the cosy sitting-room, where a bright fire was blazing in the old-fashioned fire-place. After inquiring of Eva for her mother and other friends, Mrs. Lorane left Eva and Bessie to have a good talk, while she got supper.

"I am so glad you came; I've so much to tell you, I don't know where to begin. I will show you my Christmas presents after supper; but now I must tell you all about the entertainment and supper to come off at the schoolhouse to-morrow night. We are going to watch the old year out and the new year in. You and I are to have a vocal duet; we will practice it to-morrow, and you can help me bake my cake, and in the afternoon we will go to the woods and get evergreens to decorate the schoolhouse. Here comes Tom and I suppose there will be no peace till he is out of the way. I do wish that boy was not such a tease, but I suppose we will have to stand it. There is one comfort, he is going to school after the holidays."

The topic of conversation was changed at this point by the appearance of the aforesaid Tom. As Bessie had prophesied, they had no more peace till they went to their own rooms that night.

Was there ever a girl that did not like to tell stories after the lights are blown out and the house still? Bessie and Eva were no exception to the rule; their room adjoined that of Mr. and Mrs. Lorane, and long after the farmer and his wife were in dreamland, they were making plans for the next day and frightening each other by telling the most horrible ghost stories their memories could recall; each trying to make her story appear the worst. The clock had struck 12 when Mrs. Lorane awoke and found them still talking.

"Girls, girls, you should have been asleep long ago. There will be plenty of time to-morrow to make all your plans. There will be no getting you out of bed in the morning. An early start is half the battle when there is so much to be accomplished as you propose doing to-morrow. Go to sleep at once," and the farmer's wife turned over and prepared to follow her own advice. After a short whispered conversation the girls fell asleep.

The sun was far on in his course the next morning, when a succession of raps awoke the girls, and the well-known voice of Tom Lorane was heard to say: "Early risers you are, aren't you? Eight o'clock and no sign of getting up yet. Mother called you two hours ago, but getting no answer she concluded to let you sleep. She said you were talking until 12 o'clock—telling ghost stories, I know, for I heard Eva screaming through the night and I knew some hobgoblin was after her."

Here Eva interrupted him, saying: "You must have been dreaming yourself when you heard me scream, for I did not dream anything last night."

"That is all right, but breakfast is all eaten and you and Bessie will have to cook your

own," and Tom slid down the banister and was out of the house before she had time to answer.

"How did Tom know we were telling ghost stories last night? I wonder if your mother heard us?" said Eva, somewhat puzzled at Tom's apparent knowledge.

"Oh, he always says that when he can't find anything better to tease me about; he only guessed at it."

"Did you dream of ghosts last night? I didn't, and I don't think dreams are the reflections of our thoughts; if they were, mine would not have been very pleasant last night after those stories."

"I am so glad it is a fine day. Let us go down now if you are ready," and the two girls hurried off "to make up for lost time," as Eva expressed it.

Two busier girls were not to be found in all Wild Rose valley than Eva and Bessie on that last day of the old year. Their feet and fingers seemed to be keeping pace with the flying moments, as they realized that before that time next day one more year of their lives would have flown. The cakes were baked and proved to be light and good, much to the satisfaction of both girls, who were novices in the art of cake-baking, a fact of which Tom was well aware when he told Eva that he expected to have the pleasure of using some of their cake as sinkers when he went on his next fishing excursion.

In the afternoon Tom hitched Bob to the spring-wagon and after procuring an ax they started for the woods with the purpose of getting evergreens and holly-berries to decorate the schoolroom. A merry time they had. Tom, good-natured and mischievous as ever, kept them laughing until the woods echoed with their merriment.

"I haven't had such a good time for months," exclaimed Eva, as she surveyed the wagon loaded with red berries and graceful branches of evergreen.

The woods were some distance from the schoolhouse, and it was near three o'clock when they drove up, and a large number of the young people of the neighborhood had already arrived. There was a general exclamation of delight when they saw Eva, who was a great favorite with all. What a good time they had! The boys did the hard work and the girls "bossed the job," as Tom was heard to say. He seemed to get more than his share of the objectionable "bossing," for he, too, was a general favorite. The sun was sinking to rest when they gave up their fascinating work and started for home with the expectation of meeting again a little later.

Eva and Bessie took a long time to dress that evening; like all other young girls, they wanted to look nice. Tom's exclamation of "Any time this week will do," was heard long before they were ready.

Eva Richards looked very pretty that night in her garnet dress and white neck handkerchief, with a bunch of red berries fastened in her curly black hair. Bessie looked at her for a moment with envious eyes, wishing she, too, were pretty; but she was a sensible girl, and she went downstairs with a happy heart, proud of her friend, who, in her estimation, was the model of all that was good.

The night was dark, not a star appeared in the heavens, and a dense fog was falling when they started. Mr. Lorane insisted on their taking a horse and buggy; but Tom assured him they could walk, as the schoolhouse was but a short distance from their home. On the way they were joined by several friends, and notwithstanding the fog and mud it was a merry company that arrived at the schoolhouse. How bright and cheerful it looked compared with the gloom outside! Every face looked as if for this once they had thrown aside the care of a busy, working world, and given themselves up to sociability.

They talked in groups until they were called to order by the president to hear the program, which all present seemed to enjoy. Eva Richards was happy as she watched the bright faces around her, and she wished morning would never come to bring back the common everyday life. She had a sweet soprano voice which blended with Bessie's alto to perfection, and their duet was encored, which added much to the pleasure of the evening for both. After the program was completed some of the desks were moved aside and a table brought in, on which was spread a tempting supper to which young appetites did ample justice. Cupid's messages were sent in the form of candy hearts and slips of paper on which were written sentimental poetry. Supper over, games were suggested, and all entered with a spirit into "Ruth and Jack," "postoffice" and "stage-coach." They were having such a good time that they did not perceive the flight of time until the voice of Tom Lorane was heard above the rest shouting "Happy New Year! Happy New Year!" General handshaking and wishes of prosperity for the year just entered followed. Guns were fired, tin horns blown, dinner and school bells rung, and tin pans rattled, and such a noise that you could not distinguish one sound from another greeted the coming New Year.

Eva enjoyed the excitement, but in the midst of it all her thoughts went to her mother all alone at home, and she sighed at the thought of the lonely days that must follow this happiness, and wondered why God had taken away her father and made it necessary for them to live in the city, where she felt like a caged bird longing for its freedom and pining for fresh air and

sunshine. In the midst of these thoughts she was interrupted by Bessie calling, "Eva, Eva, where are you? Come, let us get on our things and get ready to go home. Do you know where Tom is?"

"Here I am," answered Tom, appearing in the door with the girls' wraps. A few minutes after they started for home, accompanied by all the young people whose homes lay beyond theirs.

The night was much darker than when they had come and the lanterns were all ahead, theirs having been broken in the confusion; but they were all familiar with every step of the way and light hearts don't mind the dark. Walking along talking, laughing, commenting on the pleasures of the evening and enjoying themselves as only young people can, they did not notice Eva, who went skipping on before them in the darkness. Suddenly there was a scream, a cry for help, a groan, and all was again still.

They all recognized Eva's voice. How quickly the laughing and gay voices were hushed! Eyes which a few moments ago were sparkling with happiness, filled with tears. Terror seemed to seize them all, and they stood wringing their hands, not knowing which way to turn for help. Tom Lorane's voice was the first to break the deathlike silence.

"Go and get a lantern, quick, some one, any one! run for your life! Eva has fallen over the banks and is probably killed. We will stop here till you come, for we can do nothing without a light." His last words were heard only by the winds, for Ed Harris, an old friend of Eva's, was already far down the road. His cries for help soon arrested the attention of those who had not yet reached their homes. A lantern was procured and with its help they found their way back to their terror-stricken companions.

There are times in life when a moment seems like eternity. That time had come to Tom and Bessie Lorane and their friends as they awaited the return of Ed Harris. Eva, who but a short time ago was so light-hearted and happy, lay many feet below them, her voice hushed perhaps forever in the stillness of death, and they were powerless. When the lanterns arrived all were anxious to go the rescue. After some consultation it was decided to send Tom Lorane and Ed Harris. It was indeed a dangerous task they had undertaken, one which perhaps involved their lives. A short distance from the schoolhouse stood a large bridge underneath which ran a creek, whose waters the recent rain had rendered turbulent and deep, and their angry roar could be distinctly heard for some distance as they rushed along carrying stray brush and driftwood in their course. For two winters past the banks had been giving way, rendering the walking near them dangerous. The heavy rains of the winter not yet past caused an unusually large caving, taking a portion of the school ground and part of the fence, which did the double duty of separating the schoolyard from the bank of the creek. This gone, there was no protection between the road which led from the schoolhouse and the banks of the creek, rendering it an easy matter for any one who might venture too near to be thrown into the waters beneath. The trustees had noticed the danger, and intended to have it fixed, but as time and money were involved they put it off, little guessing what would be the consequence. Eva had been warned of the place when they were coming, but going back, the excitement of the evening had banished all thoughts of danger. In the darkness she had walked too near the edge, and been hurled down the rocky banks, and landed in a pile of brush and other debris which overhung the creek and saved her from being dashed to the bottom, where death awaited her in the angry waters.

The banks were steep and slippery, and as her companions looked down, it seemed as if human help could never reach her. With bated breath they waited. Tom and Ed cautiously descended, fearful every moment lest they should take a wrong step and be plunged into the surging waters, which seemed eager to make them its victims. Tom's foot slipped. Would he fall? No. He had regained his footing, and the breathless watchers above thanked God.

After what seemed ages they reached the brush on which Eva lay. Could they move the senseless form without her frail support giving way? Very frail indeed it looked in the eyes of those who had risked their lives for her. How slender was the tie between life and death for her and them. They realized this as they looked around and saw that they could not carry the senseless form up the steep bank without help, and how could help reach them there?

Tom's quick mind saw only one way of escape, and this was in having a rope on either side so that each could take hold with one hand, while they held Eva between them. This plan decided upon, they called for two ropes, and explained their idea to their companions, who at once procured the ropes and sent them to their help. As they lifted Eva the brush cracked and for a moment it seemed as if all hope were gone. But no; she was lifted safely off and they took hold of the rope. Tom's order of "pull for life" was soon obeyed, and again those above watched them ascend with their precious burden until it was laid in safety at their feet. None present ever forgot that moment; their thankfulness for her rescue was lost in sorrow as they gazed on that face beautiful in its whiteness, with the

blood oozing from an ugly cut in her forehead dampening her curly hair.

The schoolhouse being the nearest place, they took her there—there, where her own hands had helped to fasten the wreaths that still adorned the walls. But an hour ago that place had been a scene of happiness and gaiety, and Eva, who lay there so white and deathlike, the happiest of the happy. How changed it all was! Not being able to make her comfortable there, they took her to the nearest neighbor's, where the doctor had already arrived.

Mrs. Richards sat up sad and lonely watching the old year out, thinking of the sorrow and trouble that the year so nearly past had held for her, and hoping the one that was soon to dawn would be more pleasant. As the bells were ringing in the New Year, she thought of Eva in the midst of pleasure, and she was glad for her sake, although she missed her sadly; for this mother and daughter were all the world to each other. After the ringing of the bells had ceased, she went to bed but could not sleep; a strange wakefulness had taken possession of her. When she heard a step on the front piazza, followed by a rap at the door, something seemed to tell her Eva needed her. Mr. Lorane, for it was he, broke the news to her gently. The broken-hearted woman thought they would never reach their destination, although Mr. Lorane urged his horses to their utmost. At last they arrived, and with a sinking heart she went in. I will not attempt to describe the agony of that widowed mother as she beheld her only child. All night long they watched her, and before the light of a New Year gladdened the earth she was tossing in the height of brain fever. For weeks she hovered between life and death, and no one knew which would gain the day.

The crisis came at last, and the weary watchers were told that she would live. Eva is Mrs. Lorane now, and neither she nor her husband will ever forget the night of her adventure or the time that followed, of which a scar on her forehead is a constant reminder.

DOMESTIC ECONOMY.

Making Bacon.

EDITORS PRESS:—As many are making bacon now, I will give you my way. A cold, frosty time is best, but a rainy time is better than a north wind, which dries the skin on the meat so hard that it will not take salt. If the hogs are large and the weather not cold enough to cool them through, it is best to take out the back-bone and ribs as soon as killed. For salting I use a box six inches deep and three feet wide by four feet long. Pour into the box 50 pounds of Liverpool salt and 2 pounds of brown sugar. A little saltpeter will do no harm, but too much is worse than none. After the meat is cut up put each piece into the salt box and rub it well with the salt; then pack into a box large enough to hold all the meat and cover it up to keep out the flies. After it has lain one night take it out and let it air over night; then salt as before and repack. This must be done about three times, then two or three times on the third night.

After lying in the salt three weeks, take up the meat and wash off the salt and hang up to smoke. I take galvanized wire, cut it into pieces six inches long, and make hooks, which are much handier than strings. Almost any kind of hard wood is good to smoke with. Some use leather to finish smoking with, to keep off the flies. It will also keep a person from eating the meat unless he has a very strong stomach. The smoke should be kept up pretty steadily for a week, and once every two or three days for two weeks longer. Some pack the bacon in barley and some use ashes, first wrapping the meat in paper.

Vacaville, Dec. 20, 1887.

TO KNOW PURE GILDING.—A solution of chloride of copper will show the difference between gilding for which gold has been used and gilding with alloys of inferior metals. If the gilding is imitation gold, a touch of the solution gives a black mark, copper separating out through the zinc in the yellow metal; with pure metal no discoloration occurs. The test can also be effected with a solution of chloride of gold or nitrate of silver, the first of which gives a brown spot, the second, a gray or black spot; neither, of course, having any effect on gold. Common gold goods of 14 karat gold do not change their color with nitrate of silver. Leaf-gold is tested by being shaken up in a closed bottle with sulphur chloride. Beaten gold shows no alteration, while "metal" leaves grow gradually black.

"PULLED BREAD"—AN ENGLISH EDIBLE.—Pulled bread is an edible that ought to be on every American table. It is designed to be eaten with cheese, and it is delicious. Take a loaf of freshly made bread, and while it is still warm pull the inside out of it in pieces the size of your hand or smaller. Put these into the oven and bake them a delicate brown. When cool they are crisp and as full of flavor as a nut. Eat pulled bread once with your cheese and you will want it often.—London letter in Boston Herald.

The Week.

The contract between Santa Claus and the weather clerk, securing fine weather for Christmas in the interest of the children and the tourists, expired on December 27. It has not transpired what was the consideration which induced the weather clerk to quiet the elements, but it is supposed to have been heavy, and a suspicion is afloat that the Last Spike Excursion and the Oroville Citrus Fair managers bore a good part of the expense. The contract was faithfully carried out, but at the first free moment the telephonic announcement to *Eolus* set free the pent-up *Eurus* and *Notus* and the result was high carnival among the elements and the first business-like storm of the season which began last night, and as we write on Wednesday afternoon it is progressing admirably, bringing joy to our whole industrial population. Telegrams show the rainfall to be covering a large area of the State and prospects good in parts whither the storm had not yet reached. The forecast of the signal service also favors the continuance of the desirable weather.

We shall write three 8's in our date-lines for a twelvemonth. It is a thousand years since

the combination last appeared, and it will be another thousand years hence ere it will occur again. What has been the progress in the last period? What will be the progress in the next? Here is a field for contemplation!

Close of the Volume.

The point in the earth's grand orbital curve which is accepted as one of the units of measurement of terrestrial time serves us also as a division in our little world of journalistic work. This issue goes forth as the last of Volume XXXIV and closes the 17th year of the life of the PACIFIC RURAL PRESS. It is not a long time: not long enough to vote, not long enough to marry without a guardian's consent, not long enough to inherit, and yet 17 years in the life of California as an American State is a considerable period and in her history as a great self-sustaining and world-feeding commonwealth, it is great indeed. As an instance of straightforward and successful journalistic growth in California, the RURAL PRESS may be included among the patriarchs. Though judged by one standard it is old, by all others it is young and is now entering its most effective and satisfactory growing period. It enters the most active period of laborious industrial history full armed and full of strength. The years which are gone have taught the conductors of this journal much wisdom. They have learned by experience and with such a teacher, there are few who are not profited. We think we are learning each month how to make our journal of more direct value to its patrons. We understand their needs better and can better recognize the conditions under which they work, and because of this knowledge which we have gained, we can the better guide the new-comer from distant and different fields. We confess we do derive some satisfaction from being able to do this work. We enjoy the agricultural gambols of the youngsters who are turning out the boom literature of the day, and are glad to know that the cause in which they work is so good and genuine that they are not likely to overdraw or overpoint the possibilities. When, however, the people desire the most trustworthy data of actual work and its methods, they are apt to be pointed to the old RURAL PRESS which does not flash or scintillate but shines clear and true, because through its columns there gleams the light drawn from those who actually do the work they write of.

Reference to the copious index, which occupies the last page of this issue, will show how broad has been the field in which we have labored during the last half year, and how varied the information we have furnished. To the regular reader, who keeps and binds the weekly issues, each volume furnishes a collection of practical points than which there is none superior to be had, and, as indexed, it is always ready for reference.

We go forward now into Volume XXXV with the determination not to be found lacking in the industry and spirit which these stirring times demand. We welcome the help and co-operation of all to that end, hoping to return to all a full equivalent for their favors in furnishing them a journal practically valuable, morally pure, and intellectually as intelligent as with the help of all we can make it.

PROGRESS IN LAKE COUNTY.—We had a brief call the other day from H. A. McCraney, editor of the *Lakeport Avalanche*. Mr. McCraney tells of the awakening of much interest in his county on the planting of fruits and development of the higher agricultural arts generally. Great attention is being paid to the olive, for the growth of which Mr. McCraney believes a large area in his section is well adapted. A trial is to be made of cranberries by Mr. Riggs; the plants have been obtained from Wisconsin. The *Avalanche* was caught in a recent conflagration and a new outfit has been purchased. Rather more than the loss of his printing office Mr. McCraney deprecates the loss of a fine exhibit of Lake county products, which he had been for a long time collecting, and to which many of the leading farmers had contributed. We hope it may be reproduced and that we may see it when we go to Lakeport over one of the railway lines now in course of building to the famous Clear lake.

The new Healdsburg cannery is to be the largest in Sonoma county.

The Tariff Question.

The great question of protective tariff which has for years figured in our public affairs with intermittent strength has sprung into the prominence of a great political issue through the declaration of President Cleveland in his message to Congress, to which we have already alluded. It is evident that an effort for free trade is to be made on a wider scale than has been attempted for years. This fact does not, however, change the question in the least, but merely changes the associations in which it appears. It has often been said that neither of the great political parties would dare to make this issue, nor has, in fact, either one yet assumed it, but the President's action approximates that result as nearly as can be done at present.

We have no disposition to discuss this matter upon general or theoretical grounds. It is too great for our space. Nor do we desire to present it as a political issue—that is foreign to our field. It is a question the direct and immediate importance of which appears with greater or less clearness in different parts of the country, and each owes it to its own prosperity to set forth what seem to be facts of the benefit or injury which such sweeping revision of the tariff as the President proposes would visit upon its productive industries. The arguments of the indirect effects of protection or free trade can be set off one against the other. Advocates of each side can talk the other deaf and yet reach no conclusion or agreement, but each becomes the stronger in his own view. Into such argument we do not care to enter.

Concerning the effect of removing the tariff from certain products which are being pursued in California and which are just now succeeding in holding their way against similar foreign products, there can be no such indefinite and indirect issue. Our wool product stands perhaps in the most ticklish position of all, and should be mentioned first. In this product we join with other States and Territories, and the experience of the last few years, since the last revision of the tariff was effected, shows that further reform in the same direction will practically blot out our wool-growing industry. It has been hard to maintain even the slow rate of decrease which it has experienced of late, and to open the doors to foreign wool will make short work of the remainder of it as a great interest, although of course some sheep will always be grown. Remove all protection on wool and our great ranges will go ungrazed, and the millions of money now distributed among our own people will go to Australia and South America. It is rumored, we know not with what truth, that the woolen manufacturers who were so eager in 1867 to secure the aid of the growers in obtaining protection are now inclined to be very moderate tariff men. This disposition cropped out during tariff revision a few years ago. It seems as though the manufacturers, having built up their enterprise by the aid of protection which they could never have obtained without the grower's aid, are now willing to cast off the old alliance and the old tariff, so that they can obtain cheap wool from foreign sources that they may sell their cloths and carpets to our farmers not at less prices but with greater profit to themselves. They do not stop to inquire where these farmers are to get money to buy new clothes and carpets when their industry is ruined. But this is trenching on the general subject, which we did not intend to pursue. Our woolmen must exert themselves to their utmost in their own protection if they are to succeed. How they are to do this is suggested in an address by Hon. C. Delano, president of the National Wool-Growers' Association, in which he says:

The officers of your National Society desire to organize a resistance to this cruel attempt, and in order to secure its defeat by active consolidation and resistance, I advise that you petition Congress freely from all parts of the country. Send letters to Congressmen from every district. Have each association of wool-growers, State, county, township or town, pass and forward appropriate resolutions. Incite the Grangers or associations of husbandmen to unite their voices with yours in urging Congress to promote the welfare of agriculture.

But there are other products than wool, and which are of greater importance to the State, which are seriously menaced by the anti-protection movement. These are products which are essentially Californian in their develop-

ment, and though their achievement has already reached considerable figures, they are still, to a certain extent, in an experimental stage, and are being promoted with the surety of the Government that it desires such industries built up within our own borders rather than pay tribute to foreign producers. This description applies to our whole dried and preserved fruit product, to our nuts, olives, and olive oil, and in a measure to our fresh fruits, which we desire to market in distant parts of the country, and to our great wine product. Of what importance these products are to our State, let the reader examine the estimate of our dried-fruit output as given in last week's RURAL. All these products are struggling against foreign goods and are making progress. To sweep away the protection now, after our people have invested their time and money to build up such resources for their own benefit and that of the nation, is an act of ill-faith which should not be for a moment considered.

California may be trusted to die hard in this issue and California senators and representatives should lose no opportunity to make their influence felt in defense of the great and promising industries of the State. There should be no sleeping over the question either here or at Washington. We are gaining our present growth through the promise in these products. They are a high grade of products. They demand the most devoted and careful work to bring to excellence. They should be fostered and protected at least until they are brought upon a stronger basis than at present. Instead of this, as we understand the proposition of the President, they would be left almost wholly without protection or defense. This is the issue which just now calls for action. Our leading organizations have taken steps to make their views known, as has been reported in our columns. It remains now for the local organizations and for individuals to do everything they can to hold Congress to its duty in defense of American industry. Every word will perhaps be of some avail. Let it then be written or spoken as effectively as possible.

A DISTINGUISHED HORTICULTURIST.—One of the best known horticulturists of the Western States, Prof. J. L. Budd of the Iowa Agricultural College, is now in California, and will remain until after the meeting of the American Horticultural Society at Riverside. Prof. Budd is using his time to good advantage in studying our horticultural industry, and his presence at Pomona is noted by the *Pomona Progress* of Dec. 15th, and some interesting facts of his horticultural career are mentioned. Some six years ago he was selected as agent for the United States in connection with the Commissioner appointed by the Canadian Government to visit Europe, especially Eastern Europe and Central Asia, for the purpose of importing trees and plants from those countries adapted to the climate of the Northern portions of this country. Since his return he has been engaged, while in his capacity as Professor of Horticulture at the Iowa Agricultural College and in charge of the Experimental Station at Ames, in testing and disseminating varieties of his own and other importations. The work is a great one, and is destined to prove of great value to all the Northern States as well as the Northern portions of the Pacific slope. Our Southern cotemporary states that Prof. Budd intends to visit the upper portion of the State and will probably be on hand to welcome the grand excursion of his fellow-horticulturists, and to participate with them in the grand event at San Jose on January 24th.

ANALYSIS OF SUSPECTED BUTTER.—The Treasury Department has issued a circular directing that any substance suspected of being oleomargarine held in Michigan, Ohio, Kentucky, Mississippi, the Fifth District of Tennessee, and in any internal revenue district west of the above-named States, shall be sent in sample to Louis C. Starkel, the analytic chemist, Internal Revenue Office at Chicago, and the Washington office notified at the same time. Samples of such substances held in the Second District of Tennessee and in any State east of those above-named will be forwarded directly to the Commissioner of Internal Revenue at Washington.

ONE man has determined to plant 10,000 orange trees on his ranch between Penryn and Rocklin, Placer county, this year.

Annual Forestry Meeting.

At the annual meeting of the American Forestry Congress recently held at Springfield, Ill., the convention adopted a memorial to Congress urging the adoption of measures to provide for the protection of the forests; the withdrawal of forest land from entry under existing laws; the classification of forest lands; the creation of forest reserves; the sale of timber on Government lands; the creation of a Commissioner of Forests in the Department of the Interior and four assistant commissioners; the organization of a force of inspectors and an appropriation of \$500,000.

The State Board of Forestry.

We have given elsewhere a brief notice of what the California State Board of Forestry is doing. It will be noticed that one of its chief labors is the suppression of fires, which have of late been so frequent and destructive in various portions of the timber districts of the State. In reference to this matter the *Press and Horticulturist* of Riverside speaks as follows:

Our Forestry Commission have a large contract before them if they are to suppress the fires raging in the woods and preserve our wood for future generations. There is the same cry this year as last—fires on the mountains—and they are even more destructive than usual. In Northern California the quantity of timber destroyed and the district burned over is very extensive, the direct damage amounting to many millions of dollars and the future loss occasioned by denuding the mountain ranges of their protection will be greater than the present damage.

For many weeks the work of burning of the forests in this country has been going on. In nearly every direction fires can be seen at night, either set maliciously or accidentally. The Forestry Commission seem to be a useless figure-head, so far as practical work is to be done, and their whole duties consist in meeting once a year and passing resolutions. When they get right down to work and arrest some of those who are burning our forests they will be of practical benefit.

If they fail to do anything, the people should take the matter in hand and with rope and tree make short work of those setting the forest fires. The old saying, "first catch the hare," should be considered, and a paid patrol placed on our mountains and foothills, and when they discover an incendiary, let no mercy be shown him, as self-preservation is the first law of nature, and to preserve the forests is self-preservation.

From every part of the State the complaint comes of the devastating fires. The *Fresno Democrat*, in a recent issue, has an article on the subject, in which it says:

The rapid settlement and improvement of the great and fertile valleys of the State by the home-builders, the merchants, the tradesmen and the numerous manufacturing enterprises now being inaugurated throughout—notably so in this part of the great San Joaquin valley—brings a heavy demand for the legitimate use of timber, and we are compelled to have it. And as this demand will steadily and rapidly increase from year to year, where is the supply to come from a few years hence if this wanton and malicious destruction of our forests is allowed to continue? This destruction has also a still deeper significance; it tends to dry up and sap the great mountain reservoirs of our indispensable water supply, which is our very life-blood.

The damage from fires is serious in the extreme, even in the higher mountain regions where the timber is useless for lumber purposes, in the influence which such devastation has upon the flow of water in our rivers. As a result of cutting down the forests, statistics show that in 1853 Ohio had forests equal to 55 per cent of the area of the State, and now it is not over 20 per cent. Formerly droughts and destructive floods were unknown, and now these two causes alone bring a heavy loss to

the State, and every year burning drought in summer and floods in spring are a serious drawback to the prosperity of the State. Numerous other instances of a similar character might be referred to. There is scarcely any punishment too severe for the wanton or even careless setting of fires either in mountain or valley.

A Fine Group of Percherons.

We give on this page a view on Oaklawn Farm, the property of M. W. Dunham, the well-known importer and breeder of Percheron horses of Wayne, Illinois. Oaklawn is probably the largest breeding establishment in the world, unless it be exceeded by some of our great California horse-farms. The group includes Brilliant 1271 (755) head of the stud; the imported mare Francena 2744 (1577), and the colt Black Bart and filly Fortuna, both sired by Brilliant.

Brilliant 1271 (755) is black; 16½ hands; weight, 2000 lbs.; foaled 1876; imported 1881; bred by M. Ernest Perriot, of Cheneliere, near Nogent-le-Rotrou, department of Eure-et-Loir; got by Brilliant 1899 (756); dam, Rigout by Favori I (711) out of Aline by Coco (712).

In Brilliant we find concentrated the blood of the most noted Percheron stallions, all of which

GROUP OF PERCHERONS AT OAKLAWN FARM.

are traceable through their different lines directly to the famous Jean-le-Blanc, and through him possess the blood of the Arab, Gallipoli, thus intensifying in him those powers of reproduction that have made Brilliant noted. His progeny are sought after, both in this country and France, to place at the heads of the great breeding establishments of both countries.

Francena, 2744 (1577) is dapple gray; foaled 1878; imported 1883; got by Philibert (760), he by Superior 454 (730), he by Favori I (711); dam by Margot 295 (795), he by Favori I (711); etc. Bred to Brilliant 1271 (755), May 9, 1886. Black Bart is black; foaled in 1885, home bred, recorded 4259 in the Percheron Stud-Book of America. Fortuna 4384 is black; foaled April 4, 1885; bred at Oaklawn.

EUCALYPTI VOTED NUISANCES.—The trustees of Alameda have passed an ordinance declaring eucalyptus trees to be a nuisance, because of their destructiveness to sewers and their obstruction to the electric lights, and authorizing the Superintendent of Streets to remove them from the public streets.

BUT few grapes for wine are being planted in the State this season, but an unusually large acreage is being set to raisin and table grapes, especially in Central and Southern California. Muscat seems to be the favorite.

In the United States the average yield of wool is about six pounds per head.

ENTOMOLOGICAL.

Experiments With Insecticides.

The following is a detailed account of experiments made by W. G. Klee, State Inspector of Fruit Pests, with various insecticides during the months of March to September, 1887:

Whale Oil and Sal-Soda.

March 31.—Experiments at Berkeley (University orchard): 1 pound of whale oil to 25 gallons of water; 1 pound of sal-soda to 1 gallon of water. Oil poured into the boiling hot sal-soda solution. Applied warm.

1st Experiment.—Tried on orange tree infested with *Lecanium aurantii*. Tree very little affected, and all the insects touched killed in two days.

2d Experiment.—Seedling olive infested with *Lecanium oleæ*. Foliage all lost (commenced dropping the next day). Tree completely recovered in a month. All insects killed.

3d Experiment.—Bartlett pear tree infested with *A. rapax* (greedy scale). Insects nearly all killed after a week. Buds affected a little, but not enough to injure the bearing of the tree.

Sulphide of Potash Soap.

April 1.—Sulphide of potash and soap prepared as given in Bulletin No. 5. Applied warm.

4th Experiment.—Winter Nelis infested with

were made at the orchard of Mr. L. D. Green on the Sacramento river by Mr. Green and myself. Results reported by Mr. Green similar to those above.

On peach trees the results were equally good, but the same strength affected the foliage of the peach, while it did not injure the pears.

Experiments with Rosin Washes.

August 10.—Tried with Mr. A. Koebele at San Mateo and Berkeley, 4 pounds of rosins, 3 pounds of sal-soda; water to make 36 pints of solution.

1st Experiment.—A Jonathan apple tree infested with woolly aphis. One pint to the gallon, 6 gallons used on the tree. A large proportion of aphis killed the next day—caking together. Leaves mostly all dropped off. (Probably safe earlier in the season.)

2d Experiment.—2 pints to the gallon on autumn bough. Nearly all aphis killed. Foliage dropped off. [Conclusions as above.]

3d Experiment.—1 pint to gallon on Fellenberg plum affected with plum aphis. All aphis killed which were touched. No change in appearance of tree. [A very cheap and promising insecticide for aphis.]

On Orange Trees at San Mateo.—Trees infested with *Icerya purchasi* (fluted scale.) Trees not in very rapid growth.

1st Experiment.—One tree. Strength of solution, 1½ pints to gallon of water. Majority of scales found dead when examined next day. Foliage dropped a few days later. After two weeks a great many leaves had fallen. Many insects alive.

2d Experiment.—One tree. Strength of solution, 2 pints to the gallon. Same results as above.

NOTE: Mr. Koebele has told me that he has again tried the compound on orange trees in Alameda with good effect on the scale, and no injury to tree. Condition of trees must account for difference in results.

Kerosene Emulsion.

Professor Riley's kerosene emulsion with common soap.—Tried on a number of plum trees (1-9). Very effective, but owing to the curly condition of the leaves many were not touched by the spray, and the trees became rapidly infested.

Rosin Solution.

Formula: 60 pounds of rosin, 60 pounds tallow, 10 pounds commercial potash dissolved in 10 gallons of water, 10 pounds caustic soda (98 per cent) dissolved in 10 gallons water. Dissolve the rosin and tallow. When dissolved, add caustic water slowly. After mixture is made, add 10 gallons of water. Of this was used 1 gallon of mixture to 10 gallons of water, lukewarm.

Experiment made on the property of Mr. Ch. Lefranc, Santa Clara county, on various trees.

September 1.—1st Experiment.—One large orange tree infested with *Icerya purchasi*; sprayed thoroughly. Reported by Mr. H. Lefranc as having done good work. No injury to foliage. Examined in November again by myself. Tree comparatively free from insects, having been sprayed again a short time before my visit.

2d Experiment.—On oleander badly infested with black scale, nearly all lately hatched. Examined in November again. Much foliage lost, but nearly all scales killed.

Compound Furnished by Mr. L. D. Green.

Time of application on University grounds, end of March.

1st Experiment.—One pear tree with buds expanded. Strength used, 1 part to 12 of water. Tree infested with *Aspidiotus rapax* (greedy scale). Portion of scale killed when examined two weeks later.

2d Experiment.—One apple tree with buds not much developed. Tree infested with *Mytilaspis pomorum* (apple bark louse). Strength, 1 part to 6 of water. Examined two weeks later; only a small portion of scales killed.

Third Experiment.—One acacia tree infested with *Aspidiotus rapax* (greedy scale). When examined two weeks later, about one-half of scales killed. Application with the compound made at a temperature of 135° F.

Woodbury Tree Cleanser.

I have examined large orchards treated with this compound last winter, and find very good results in almost every case. The compound must be well mixed, otherwise it may damage trees badly, in summer especially. As prepared

A. rapax, and also against black fungus. Buds shriveled.

5th Experiment. Pear tree. Same dose. 6th Experiment.—Acacia floribunda. Same dose. Ninety-five per cent of scale killed after a week.

Sulphide of Soda Soap.

March 31.—Sulphide of soda and soap prepared according to Bulletin No. 5.

7th Experiment.—Applied warm to one lemon tree infested with *Lecanium Hesperidium*. Foliage slightly affected. All insects touched killed.

8th Experiment.—Small olive tree infested with *L. oleæ*. Foliage not affected. Some of the older insects not killed.

June 9.—On asylum orchard, Berkeley: Sulphide of soda prepared by using 1 pound of lye and 1½ pounds of sulphur to 5 gallons of water, adding soap, 1 pound to 5 gallons. The mixture thus prepared was used at the rate of 2 quarts to 5 gallons.

1st Experiment.—Plum tree infested with *A. perniciosus*, the majority of them running about. Examined six weeks later; very few living scales to be found. No damage to tree.

2d Experiment.—Sulphide of potash, same strength and soap the same. Three plum trees badly infested with *A. perniciosus*. Examined in six weeks, very few scale alive. No damage to tree.

Arctic Oil Works Insecticide.

3d Experiment.—Insecticide from Arctic Oil Works, one pound to three gallons on pear tree badly infested. Same results as above. Tree examined again in December—very few live scales. This is a valuable summer remedy and perfectly safe.

With Sulphide of Soda and Potash Soap.

Similar experiments on a number of pear trees badly infested with *Aspidiotus perniciosus*

by Mr. Woodbury I have known of no case of injury.

In addition to the experiments here recorded, the experiments mentioned in my paper on the codlin moth, and which were made both at the University and at Santa Cruz, were made partly under my direction. Regarding the experiments made at the University, I desire to state that they have been co-operative; I, in most cases, furnishing the various washes and mixtures for trial, and the authorities there the apparatus and labor. I hereby extend my thanks to Professors Hilgard and Wickson and their assistant for all the facilities they have offered me in this way, as well as for other favors of which I am continually the recipient.

Besides the experiments mentioned here, I have made and caused to be made a number of others, the results of which I have not yet been able to ascertain.

Mr. Block's Report.

The State Board of Horticulture has received an interesting report from A. Block of Santa Clara, Commissioner for the San Francisco district.

The Commissioner represents that the orchards in his district have during the past season yielded good crops of fruits, and that the prices have been very fair for all qualities and kinds of fruits. The insect pests have been fairly well controlled, and the industrious horticulturist can now rest assured that with ordinary attention and care he can, if not exterminate, at least control the most pernicious insects, and keep them in subjection so that the largest part of the crop can be easily gathered. As a remedy for the codlin moth, the Commissioner recommends one ounce of Paris green to every ten gallons of water, with a little soap, sprayed at least twice or even three times during the season. He says at this time a united effort ought to be made to exterminate that greatest of all the pests, the cottony cushion scale. The great secret of successful warfare against this dread enemy of the fruit-grower, he says, is a treatment which will prevent their multiplication. There have been discovered several remedies which are efficacious in this direction, for which the Commissioner refers to the reports of the State Inspector of Fruit Pests.

SPIDERS AND INSECT PESTS.—It is stated by a German entomologist that more of the insect enemies of trees are destroyed by spiders than by all the insect-eating birds.

THE HONEY.

The Honey Trade of 1887.

Geo. W. Meade & Co. of San Francisco make the following reference to the honey product of California:

Extracted Honey.—This was the off year in the extracted honey industry, and we report quite a large decrease in the product from last season and the quality generally, as far as color is concerned, has not been as good. On account of the light crop, however, prices have ruled from 25 to 50 per cent better, so those producers who had good crops have received very satisfactory returns. We do not think there is any question, anyway, but what the honey of California is the finest produced in the world, both as regards color and flavor. Our bee-men have had many discouragements to contend with, the principal among which is the competition with the low-grade black honey of Cuba as well as the Chili honey, but as the consumers get to using California honey more, they call for it and are willing to pay advanced prices. One thing can be said in regard to California honey, and that in nine cases out of ten, shipments made from here are absolutely pure honey. The article has been and is still so reasonable in price that there is nothing that it could be adulterated with or that would pay to do so. We are pleased to note that our suggestion made last year, in regard to dispensing with old oil cans and cases and using new cans and cases, has been to some extent adopted, but there is still considerable room for improvement in this matter. While the old tins as used here are thoroughly cleaned with potash and as a rule are all right, they have a very unrepresentable appearance and it would pay our producers much better and they would get enough more for their honey if they would put it up in new cases and cans.

California Comb Honey.—Like extracted honey, this product is also reduced in quantity this year. The quality, however, has been very good and has brought much higher prices. Our suggestion made for several years past to put up this honey in one-pound frames instead of two-pounds, we are glad to note is being gradually adopted. As a general proposition the one-pound frames are preferable, especially when the goods are to go East. On this coast and in the Territories two-pound frames are all right enough, as the average consumer there is willing to buy that quantity, but for the far Eastern trade, where things are brought down to a finer point, one-pound frames are much more desirable and sales are frequently lost on California comb honey from the fact that it is put up in two-pound frames. Notwithstanding discouragements now and then, the honey industry of California is bound to increase year by year, as there is no more favorable location in the world to produce honey than in this State.

PUBLIC AFFAIRS.

Reciprocity With Mexico.

EDITORS PRESS:—A reciprocity treaty with Mexico was made a few years since, but as yet has not been ratified by the United States. This treaty has generally been condemned by the fruit-growers of California as something inimical to their interests.

Reciprocity of trade between two nations or peoples is one simply of policy. It may be free and unrestricted or it may be trammelled with conditions in the way of tariffs looking to revenue. By the terms of this Mexican reciprocity treaty certain productions of the two countries might be sold, traded or made merchandise of in either country without any tariffs, restrictions or duties levied on such merchandise by the government authorities of either country. Among such merchandise fruits were included. To this the fruit men of California objected. In imagination they saw in the near future the markets of the United States flooded with Mexican fruits to the exclusion of their own. Now is there in fact anything in this fear? Is it not the baseless fabric of a dream?

Mexico as a country has not the reputation of being adapted to the growth of the fruits of the temperate zone, the apple, peach, plum, apricot and kindred fruits, while she does produce in abundance the citrus fruits, the pineapple, the tamarind, the banana and other tropical fruits. Now, if the people of California and other of the United States consent to swap fruits with the people of Mexico, would not all be benefited? The people of the United States want tropical fruits and they send out of the country for them. Mexico has them and to spare; Mexico wants our fruits and is desirous to swap her fruits for ours. Now why should we not trade?

Mexico grows tobacco of fine quality suitable for choice cigars. Why should we not buy the same, duty free, and pay for it in fruit?

Mexico has a population of ten or a dozen millions of people, many populous cities whose population would, under a treaty of reciprocity, take and consume vast quantities of our canned and dried fruits. Why, then, not meet the Mexicans on equal terms and buy and sell of them just as we do of each other at home, thereby enlarging the markets for our orchard productions?

Orange and lemon culture is the only possible fruit industry which could come in competition with us in our markets, but Mexico has never produced largely of these fruits. Mexican oranges are seldom seen in San Francisco market, while Tahiti sends over shiploads every year. Mexican oranges are never seen in the New York or New Orleans markets, while every year those markets are flooded with oranges from the East Indies and the Mediterranean.

Now the U. S. tariff on oranges and lemons (which, by the way, is pretty heavy, being for oranges 25 cents and lemons 30 cents per box) does not seem to deter the shipment of these fruits into the United States, but from Mexico none or next to none are imported. The inference is, these fruits are not grown in Mexico for export. Free trade in these fruits would not soon largely increase their production, so I think the growers of citrus fruits in California have little to fear from Mexican competition in those fruits.

The great body of the surface of Mexico is, as is well known, an elevated table-land, 5000 to 7000 feet above ocean level. Its climate is temperate and healthful, but it is traversed by few streams, and these few generally wind their courses toward the sea in channels of great depth, so little can be done in the way of irrigation. Hence the immense table-lands of Mexico have little value, except as stock ranges.

The leading industries of Mexico are mining and stock-growing. The growth and prosperity of her cities and towns depend upon the success of these industries. In exchange for the products of our industries we are offered the products of theirs. They offer nothing but what we want and need, and but little which we produce ourselves. There may be a few oranges and lemons, and perhaps a few grapes, but in such limited quantities as to have no appreciable effect upon the markets of the United States. And judging from the characteristics of the Mexican people, crystallized by three hundred years of occupancy of the country, there is little danger of any material increase in the quantity of these fruits.

But with free trade between the United States and Mexico, would not the ever-pushing Yankee go there and with cheap labor and cheap land start a fruit industry which in time would become overpowering to the industry in this State? I think not. The *Caliente*, or hot-moist belts of Mexico, and the only really natural fruit regions of the country, he would not seek because of yellow fever always prevalent there. If he turned his attention to the elevated table-lands of Mexico, confessedly healthy, he would be met at the threshold by a scarcity of water for irrigating purposes, and without irrigation he could grow no fruits there, and if he turned his attention to the mountain valleys, in themselves small in extent, he would find them all occupied by the native population, and cultivated to corn, beans and red peppers, with some little fruit for domestic uses. Seeing there no inviting opening to start in the fruit industry, he would turn his

attention the same as he now does, to mining; success in that, the leading industry of the country, becoming the aim of his life. With that in view he would leave the fruit industry to those enterprising men in California who are, or who may hereafter engage in the industry, to make the most of it according to their skill and ability. He would say to them: Prosecute your industry to success; send me of your fruits and I will send you silver in exchange.

No; I think we have nothing to fear from Mexican competition in the fruit industries of our State under any circumstances. And with a free unrestricted interchange of commodities between the United States and Mexico, the fruit-growers of California would profit immensely. We would open a new and profitable market for our canned and dried fruits, our apples, peaches, apricots, prunes, and raisins; and some kinds of canned fruits, by reason of their being admitted free of duty, would come in successful competition with similar fruits of Spain, France and Germany, which are admitted under tariff duties. We would have such an advantage that eventually our merchants would control the market in the dried and canned-fruit line. But this is not the only advantage which would inure to us. Mexico produces largely of tropical fruits, of dyewoods, drugs, and medicinal herbs. All of these things we import, paying thereon heavy duties. By free interchange those duties would be abolished, and the consumer would be relieved from the burden of them. In a word, under the reciprocity treaty, which has so long held fire, we would be able to sell more at a profit, and buy many things cheaper than we now do.

The fruitmen of California seem to think and act as though all the world has the advantage of them in production and trade, and that to maintain an equality in production and trade they must have tariffs. They would close the entry ports of the United States to all importations of anything likely to compete with their own productions. They would monopolize the home market, forgetting their ability to much more than supply the home demand. To dispose of their surplus productions is now the problem they are called upon to solve. Mexico proposes to help them out to the extent of her ability on the basis of a few interchanges of commodities. Oh no! that won't do; your system of cheap, poor labor would ruin us. What stuff and nonsense! If the Mexican can produce cheaply, competition under the great laws of trade, supply and demand will compel him to sell cheaply and he will buy of our productions in our markets according to his necessities as cheaply as he can. But he will buy and thus a trade is effected. By the trade all concerned are benefited; no one is injured. This continued restrictive policy contended for by the fruit-growers of California is a penny-wise pious-foolish policy, and the sooner it is abandoned the better it will be for the California fruit-growers. WM. C. BLACKWOOD.

Haywards, Cal.

POULTRY YARD.

A Turkey Transaction.

EDITORS PRESS:—Whenever the editor makes an appeal to the patrons of his paper to renew their subscription, or when the agent on his rounds strives to add new names to his list, some people there are who look upon the gain as wholly on the side of the paper. The following incident which fell under my notice, and which I relate just as it occurred, in the essential points, shows that the benefits are mutual.

Two ladies, living on adjoining farms, were engaged in raising turkeys. The first was a widow, whose small ranch, not very judiciously managed, scarce met her expenses, and it was by having a fine band of turkeys each year she was able to add many comforts to her home. The other, a girl, still living with her parents, but having a true American feeling of independence, was striving in this way to make not only her spending money, but to help others, in small ways, as well. In the spring both ladies had been faithful, though the widow, whom we will call Mrs. Thornton, was considerably ahead; her band numbering, when grown, 123; while her neighbor, Sadie Caxton, had but 97.

The holidays drew near, but our turkey-raisers concluded that prices were too low, and held over. It happened that year that the spring plowing came on very early, and even in February men and teams were so busy one could scarce get a team for the weekly marketing.

"Come, Harry," said Mrs. Caxton one morning, "hitch up old Jerry and drive into town for the mail, and whatever mother wants; and be sure to go by Mrs. Thornton's; she may have no chance to send."

Harry was soon at the good lady's door. "Now, that's real thoughtful," she declared; "and as I have a number of errands, if you will let Jack go with you, I will have him ready in a short time."

As Mrs. Thornton buttoned Jack's collar and adjusted his necktie, she gave him many and varied injunctions, "and remember, Jack," she added as she pulled down his jacket by way of emphasis, "to be sure and ask the price of turkeys." That night Mrs. Thornton was busy when the boys returned, but to her first question that she asked as Jack entered with his

arm full of bundles his answer was "Oh, I forgot!" Supper over at the Caxton homestead, Mr. Caxton settled himself with a sigh of satisfaction to the contents of his mail. "Turkeys are up," he called out to his daughter, who was busy in an adjoining room. "The *RURAL PRESS* has them quoted at 28 cents." Morning found them a busy household. Every one was helping, and by night, 85 fine fat birds were hanging up ready for packing and transportation; and partly because they were so busy, partly because they knew Jack had been with Harry, no one thought necessary to send word concerning the price of poultry to Mrs. Thornton; and she being a woman who thought she could not afford \$3.00 for a paper when she could "get plenty for 50 cents," was quite ignorant as to the rise. I cannot here give all the details; but Susie received, after freight, commission, etc., etc., were all paid, \$320.42. Great was Mrs. Thornton's consternation when she heard at the end of the week of the whole transaction. "Of course they'll drop," she prophesied; "that's just my luck." Which is the word some folks apply to the results of their mismanagement.

And drop they did. The next week Mrs. Thornton sold for 19 cents; and though her friends told her, by way of comfort, that it was still a good price, the thought of the extra nine cents she might have had, and the fact that Susie Caxton received just \$31.39 more for 85 turkeys than she for 111, quite took away her satisfaction.

So like the man who thought he could not afford a pair of boots, but did afford a doctor's bill, our good lady found that "there is that which holdeth more than is sweet, but it tendeth to poverty."

ONE WHO KNOWS THE BENEFITS.

Dec. 24, 1887.

Santa Rosa Notes.

EDITORS PRESS:—This morning Venus shone brightly at 10 o'clock, and was viewed by many citizens. This is evidence enough that our sky is clear, atmosphere light and weather beautiful.

Farmers are now busy from "early morn to dewy eve" turning over the soil preparatory to planting and sowing for the coming season.

Many hundreds of acres will be planted next spring in olives and the California petite prune, formerly known as the French prune; but why call it the "French prune," for our prune is much superior to the French prune? Our local nurseries cannot supply the demand for the olive or prune, either from their own stock or the nurseries of the State. Our country is especially adapted to the growth of the prune, and any one engaging in that industry is bound to reap a reward for his labor. Both the quality and the price are generally advancing. While the districts adapted to the growth of the prune are limited, other fruits are being set out to considerable extent—but the prune and the olive are taking the lead by a large majority.

The Santa Rosa & Carquinez railroad is gradually approaching our young city. The graders are now in camp in the lower end of Los Guillecos valley, about 14 miles from Santa Rosa, and are coming ahead as fast as they can under the circumstances.

Our people here think they appreciate the advantages that this railroad will be to them, but they do not nor will they until the road is completed. Then a market for our various products, particularly fruits and wine, will be brought to our doors; then, and not till then, will we fully appreciate the inestimable value to Sonoma county of the Santa Rosa & Carquinez railroad.

Santa Rosa is improving, growing gradually and healthfully all the time. New sewers are being laid in our streets and the streets graded and macadamized. The Santa Rosa Water Company has made large improvements by laying down new and large mains and increasing the supply, and now will have a bountiful supply, with good pressure, of the purest of water; or pure as water can come from an undefiled mountain stream.

Santa Rosa.

URSA MAJOR.

A NEW STYLE OF HARVESTER.—A. W. Lockhart of Woodland, the *Democrat* says, has devised a harvester which promises to surpass any machine of the sort made heretofore. No sickle is used, the heading being done by the "stripping" process which has been in use in Australia for years. The front, or finger-board, is lined with wide teeth, grooved on top, between which the heads of the grain are caught and shaved from the stalk, leaving all the straw standing. The heads are caught by fans which strike them just as they escape from the teeth and shell the grain. The grain and chaff are carried by succession back and up an elevator, where they are separated, the clean wheat going into one spout, the mixed into another, and the chaff into still another. The cleaning process is one of Mr. Lockhart's own inventions, independent of the rest of the machine, and is a great success. The most striking thing about the machine is its simplicity. Only two belts are used, and no sickle, cylinder, screens, auger or riddle. The machine just completed is a 12-foot cut, and can be run easily, it is thought, with eight horses, as the absence of machinery renders the draft light. Many good machine-men have examined it, and say it will excel anything yet invented in the harvester line.

THE STOCK YARD.

Dehorning.

[Written for the RURAL PRESS by I. C. STEELE.]

The subject of dehorning cattle is evidently receiving consideration by thoughtful men engaged in the cattle industry. This is as it should be. It is an important subject, and those directly interested should furnish the facts necessary to a correct solution of the question. There are two sides to every question, and it is to be expected that intelligent men will honestly differ.

For myself, this question has been decided for dehorning, from observation and experience, after what seems to me ample opportunity; but facts are what is needed, and I shall feel obliged to my fellow-farmers who differ with me if they will furnish the facts on which they base their judgment. There are doubtless many who will feel obliged for the publication of such facts.

I have read the account in the *Rural Press* of Nov. 10th of a man killed in England and another in Iowa by polled Angus bulls. This I take as an argument in favor of horns. To me it appears to be the exception to a general rule. That polled cattle are sometimes vicious there is no doubt. I have handled such myself, but the two instances above mentioned are the only ones I remember to have ever heard of in which any person was killed by such animals. Polled cattle never injure other stock. I have read of four men killed by horns in California within a few months. In one case a bull took a man from under a fence and impaled him on his horns. What my friend says about handling bulls is undoubtedly true. I know he handles his bulls, and all his stock for that matter, with consummate skill. He never takes any chances with a bull, and is safe for that reason. If a bull never has an opportunity to gore a man it is certain he will never kill a man, with or without horns; but how many bulls or herds in this vast country are handled or likely to be handled in this way? Bulls by the thousand are free from such restraint or handling, and in the conditions surrounding us will remain so indefinitely, and the subject must be examined from that standpoint. The question naturally arises, what compensation is there for growing horns for the dairy or for beef? I can readily see how men engaged in raising fancy stock, expecting to get fancy prices, and who make symmetry and color in horns a point to breed for, and who have mastered the subject of fancy breeding, should regard dehorning with disfavor. And here I desire to pay a tribute of respect and to gratefully acknowledge the services of these men to the cattle industry by demonstrating the important fact that careful, intelligent breeding will secure the qualities in cattle desired by the breeder. With these men I have no contest. To those who fancy horns I would say—let them be things of beauty, for that is their only value.

To the dairyman, horns are a constant menace. In traveling to and from the place of milking, cows horn each other; if milking is done in the corral, there are times when a general horning will occur, and nearly every cow in the herd will get the benefit of some other cow's horns, and is more or less injured. Milking is delayed, and bad temper prevails. If milking is done in the stable, extra help is necessary in putting in and letting out the cows, to prevent horning. If a cow gets free, some other cow is almost sure to get a severe horning. Add to this the occasional loss of a fine cow or horse from horns, and it presents an array of annoyances that will rattle the temper of a saint. H. H. Haaff says in his work on Dehorning:

If dehorning should become a uniform—a common—practice, there would follow a saving of:

1st. 200 lives of human beings in the United States each year.

2d. The lives of 100,000 cattle and horses each year, not to mention sheep and hogs.

3d. Nearly all loss of calves by abortion.

4th. One-quarter of our winter feed for cows and stock cattle.

5th. One-half our shed room.

6th. All manure now wasted around sheds and stables.

7th. All loss in shipping cattle.

... Allowing that there are 200 deaths by horns yearly, that would give only 10 as the quota for Illinois, and is under the mark; that is to say, the average would be one death to each 300,000 of population (nearly). The loss of stock no man can more than estimate; but when one considers that every farmer almost loses animals right along by horns, it will be seen that the esti-

mate is not too large. The saving in feed comes, of course, because cattle without horns will pack and keep warm and quiet, and because warmth saves feed. I have carefully tried the matter for three winters, and can say that one-quarter of my hay is saved to me in this way. . . . As to shed room, I keep 250 head of cattle in a shed 3 by 160 feet. Does any one suppose that one-half that number of cattle can be kept in that shed with horns? No, not 100 head. . . . As to shipping cattle, I will repeat the statement made to me by a representative of the *Drovers' Journal* recently. Said he: "They have tried all kinds of patents and nothing yet found but bruises the cattle, and there is but one way out—but one solution of the question—and that is a car with no protuberances, and no horns on the cattle." Said another: "Give me the loss by horns on the plains, and I will outrank a Vanderbilt in wealth in a very short time." Said another: "Give me the losses by horns in shipping, and I will rank with you." And I will add: "Give me the losses by horns in the States alone on small farms and the homes of every-day people, and I will become a Croesus in wealth in ten years." If then I can help to save the lives of men and cattle, the feed and the manure, what better work can one do for his day and generation?"

As to the effect of dehorning on the disposition of cattle. We have practiced cutting off a portion of the horns of cattle that became unusually troublesome with their horns for years, and have always found it salutary. The four bulls we dehorned last summer are well and thriving, and are turned into the corral together every day, and are quiet and gentle. They all take feed from the same box as quietly as calves would do, in fact two Holstein calves feed with them, and are not molested.

Horses' Shoulders.

EDITORS PRESS:—As it is plowing time and plowing is the hardest work on the farm upon horses' shoulders, perhaps a few words about curing sore shoulders would not be out of place. I tried vitriol, alum, salt water and sugar of lead, but never found anything with which I could cure a galled shoulder while working the horse, until I tried tallow. As soon as the collar is taken off the horse, clean it well and rub on the face of it a good coat of tallow, and rub the horse's shoulder well with tallow, putting on plenty. I can cure a sore shoulder by this treatment and work the horse every day.—G., Vacaville.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Beautiful Ever-Blooming Roses.

All lovers of choice flowers should send to the Dingee & Conard Co., West Grove, Pa., for some of their lovely roses. These roses are certain to bloom, and are the finest in the world. They are sent a fely by mail, post-paid, to all post-offices in the United States. This company is perfectly reliable, and noted for liberal dealing. They give away in premiums and extras more roses than most establishments grow. Send for their New Guide, a complete treatise on the rose (100 pages elegantly illustrated), free. See advertisement in this paper.

Buena Vista Rancho.

This fertile tract of land, containing 7725 acres, has been platted into 60 farms suitable for mixed farming and fruit growing. It is four miles from Salinas City, Monterey County, and will be sold at low prices and liberal terms. Address, J. C. Hoag, 312 Van Ness avenue, San Francisco, or Tyler Beach, San Jose, Cal.

Consumption Surely Cured.

To the Editor:—Please inform your readers that I have a positive remedy for the above named disease. By its timely use, thousands of hopeless cases have been permanently cured. I shall be glad to send two bottles of my remedy FREE to any of your readers who have consumption, if they will send me their Express and P. O. address. Respectfully,
T. A. SLOCUM, M. C., 181 Pearl St., New York.

"What ye sow, that shall ye also reap." If we sow good seed, we may confidently expect good results; hence, it behooves every man and woman to carefully consider where the best seed may be obtained. Seed that is warranted pure, fresh, and raised on his own farms, is what the veteran seed grower, James J. H. Gregory, of Marblehead, Mass., offers the public, and his well-known integrity makes his warranty a valuable one. Send for his 1888 catalogue.

The Butte County Citrus Fair.

The Citrus Fair, whose happy opening in the spacious tent at Oroville we noted a week ago, appears to have quite fulfilled the high promise of its outset. Words of praise, pleasure and admiration only, make up the varied and voluminous reports, in both country and city papers. The abounding wealth of citrus and other fruits, with the completeness of the arrangements that had been made, and the taste evinced in placing the exhibits, combined to bring about a result that more than satisfied expectation.

The tent, it may be remembered, was 150 feet long by 50 feet wide, and all around this great room, from the floor to the eaves—16 feet vertically—were sloping piles of fruits, vegetables and other products, while the middle of the hall, saving an aisle on either side, was occupied with numerous and beautiful citrus designs.

Space had been assigned to every town in the county, and in some instances to individuals who desired to make separate showings.

The exhibitors numbered hundreds, and the displays included oranges, lemons, limes, shaddockes, citrons, persimmons, pomegranates, olives, figs, apples, pears, quinces, plums, grapes and strawberries—all grown outdoors, and picked from the trees or vines since December 18th—besides almonds, walnuts, butternuts, pecans, chestnuts and peanuts. Then, too, there were cabbages, potatoes, tomatoes, peppers, squashes, pumpkins, water and muskmelons, beets, celery, artichokes, peas, castor beans and hops, with 49 varieties of wheat, in sheaf and jars, 10 of barley and 15 of corn, beside Egyptian pop and broom corn, sorghum and sugar-cane.

It is, of course, impossible for us to attempt an enumeration of the exhibits, which came from Bangor, Berry Creek, Bidwell's Bar, Big Bend, Biggs, Bloomer Hill, Chico, Central House, Cherokee, Clear Creek, Concord, Enterprize, Forbestown, Gridley, Hurlston, Magalia, Messilla Valley, Morris Ravine, Mud Creek, Nimshew, Oroville, Paradise, Spanishtown, Sundale, Thompson's Flat, Wyandotte, Wyman's Ravine and Yankee Hill; we can only notice a few of the more striking.

The Chico exhibit, stretching for about 80 feet from the northeast corner to the center of the north side, was the handsomest and most varied in the pavilion. The leading feature was a cottage front with two windows and a door, of full size, in which openings were placed mirrors which gave a fine effect. The house with all its panel-work and cornices was entirely covered with oranges and evergreen trimmings. Here too was the "golden candlestick," described in the books of Moses, represented in due form by gaspipe, hidden in oranges, with seven flaming tips—an ingenious and pleasing design, for which, as well as for the cottage, much praise was accorded to B. F. Allen, who planned them both.

The exhibit from Gen. Bidwell's ranch, tastefully arranged by H. H. Camper, was very elaborate and was thought to illustrate more fully than any other the scope of Butte county's producing capacity.

From Messilla valley, situated about 12 miles north of Oroville, at an altitude of over 2000 feet, came remarkably fine oranges, lemons, persimmons, pomegranates, nuts, vegetables and raisins. Among the exhibitors from this region was Jesse Wood of the *Chico Chronicle Record*, who calls his pretty place "Eyre Villa," and had above his display a large brown eagle with wings outspread. Six years ago Mr. Wood went to the place that is now his home and made a homestead claim on 160 acres of Government land. It was covered with chaparral and timber, but energy and industry cleared 20 acres or more, a variety of fruits was planted, a house put up, and now from the 15 acres of orchard a marvelous number of products have been sent to the fair. In his exhibit was a chair representing "Comfort," made of oranges, lemons, persimmons, limes, apples, walnuts, almonds, olives and several kinds of grains and grasses, which looked delicious, if not comfortable. Another design emblematic of "Industry" was a plow, with share and point fashioned in apples, and the beam and handles of oranges. There was also a large display of roses and other flowers grown in the open air.

D. N. Friesleben, the manager of the fair, and his daughter, had a very ingenious and attractive exhibit. Oranges were piled into the symmetrical form of a beehive, and surrounding it was a gigantic horn of plenty—also of oranges. By a contrivance of pulleys and belts and a water-motor below, oranges appeared to be pouring constantly from the horn, and other oranges on a wheel represented bees going in and out of the hive. The forms were symbolical of the industry and plenty that prevails in the Oroville district.

The largest single exhibit of oranges was made by George Le Rossignol of Oroville, who had 4300 choice samples of the fruit in a wire crate five feet square and two feet deep.

From Nimshew, 31 miles north of Oroville, at an altitude of 2300 feet, M. V. Roe sent 22 boxes of mountain apples, of as many varieties, besides pears, persimmons, dried fruit, including plums, nectarines and apricots, English walnuts, raisins, figs, various vegetables, and 19 varieties of jellies—a wonderful exhibit for a foothill ranch of such elevation.

One of the most attractive things within the canvas was an accurate miniature model of the

Oroville Congregational church, clad in evergreen and oranges, large enough to contain an organ and choir, whose music was heard from time to time.

Among the more conspicuous exhibits were those of Dr. R. Parker, H. W. Skinner, O. H. Wilcox, Judge Lott, Jos. Gardella, Judge Freer and H. C. Bell. Mrs. E. W. Fogg's floral display was singularly artistic, and C. H. Leggett and Son's freshly gathered grapes and strawberry-plants, with blossoms and ripe fruit upon them, grown in the open air, impressed the fugitives from Eastern winter.

The town was thronged with visitors, whom the pavilion was all too narrow to accommodate. There were excursions from Marysville and Chico, and a number of delegates returning from the "last spike" celebration, having been received with high honors, addressed a testimonial to the Executive Committee of the fair, in which they say:

The oranges include Seedlings, Washington Navels, Mediterranean Sweets, Malta Bloods, St. Michaels and other fine varieties, and are of unusual excellence and of high commercial value.

The display of lemons is large and of the finest quality. The exhibit of Sicily lemons, the most delicate and sensitive to frosts of all semi-tropical growth, is especially noticeable. The figs, raisins, pomegranates, persimmons and other semi-tropic products are remarkable for quantity and good quality. We have visited the many citrus groves surrounding Oroville and found the trees laden with the ripe and golden fruit, and the growth, without exception, healthy, luxuriant and entirely free from disease or tree pest.

We saw many trees, both orange and lemon, a quarter of a century old, which have had no protection, and which have in all that time suffered no injury from frost.

The new citrus plantations at Thermalito and other places show very vigorous growth and give great promise of future production and profit. The wide area surrounding Oroville and the foothills, with low altitude above tide level in a comparatively frostless belt, now available for citrus cultivation, with the great abundance of water for irrigation, points to a wonderful production in the near future. The absence of devastating winds, cold storms, fogs, frost and cold ocean air currents, and the early maturing of fruits, are favoring conditions that will speedily produce such desirable results.

Among those who signed the address just quoted were A. T. Hatch, Pres., and J. M. Davies, Sec. State Board of Trade; R. G. Sneath, Ex-Pres. S. F. Chamber of Commerce; N. W. Spaulding, A. H. Phelps, John F. Swift and other noted citizens. "I've been to six citrus fairs in this State, at National City, Riverside, San Jose, San Francisco, Sacramento and Oroville," said Mr. Hatch, "but none came up to this Oroville fair."

Nearly all the visitors went over to see Thermalito, the "warm-belt" colony, just across the river.

No court was held in Oroville during the week, and the people of the place generally took a holiday and shared with their guests in the enjoyments of the occasion. Addresses were delivered by ex-Congressman Luttrell, Gen. Bidwell and others. The ladies of the Congregational church served lunch daily and netted a handsome sum toward buying a library for the town. All county people were charged an admittance fee of 25 cents, but all visitors from out of the county were given complimentary tickets. An idea of the attendance may be gained from the fact that the week's receipts will foot up near \$1000.

On Saturday it was announced that the fair would be kept open until Wednesday evening, the 28th, and that an excursion would be run from San Francisco on that day, when the judges of exhibits would announce their decisions. As this is the evening on which the *RURAL* goes to press, we are obliged to defer all mention of the awards to a later issue; but the general verdict has already been enthusiastically rendered, "It was indeed a grand success."

HOLIDAY OVERLAND.—The *Holiday Overland*, which appears this week, is a very creditable production. The articles are of high literary merit, and their local flavor, gratifying at home, should make the publication fresh and interesting abroad. The illustrations are excellent. We are glad to see the *Overland* showing so many signs of prosperity. It has a well-defined field, occupies it well, and is a credit to our far Western progress.

HARDY NORTHERN GROWN SEEDS.—Westcott Brothers, a new firm of seedmen, have just established themselves in this city at 406 Sansome street. H. R. George, formerly of Geo. F. Silvester, will be with them. They keep a full line of seeds, bulbs and plants, but their specialty is hardy northern-grown seeds from Minnesota, which are much sought by Southern gardeners on account of their superior vitality.

WELCOME IN THE WEST INDIES.—A Cuban bee-keeper writes, Dec. 31: "The *PACIFIC RURAL PRESS* comes to me every week, and I can assure you it is a welcome visitor. Its editors may well be proud of so clean and healthy a sheet. Long may it live to reap the reward it so justly deserves."

SANTA CRUZ.—We have received the November issue of Herbert Myrick's "Real Estate Exchange and Mart," a publication which contains much information about lands in the vicinity of Santa Cruz.

Other Notes in Santa Cruz County.

EDITORS PRESS:—Aside from the numerous attractions which the Ben Lomond district presents as regards scenery and healthfulness, the soil is very productive. Among the fine places I visited was that of Mr. Sanford Blodgett, who is extensively engaged in fruit-growing, having an orchard of 30 acres of thrifty bearing trees of almost every variety grown in the State. To my surprise I saw a crib of corn here that reminded me of the old Hoosier State, which I left some 20 years ago. Descending the mountain and following up the San Lorenzo river a few miles I put up at the Hartman house, Boulder Creek, on the evening of the 4th inst. Here I met a number of staunch friends of the *PRESS*. Mr. J. W. Perry, one of the first settlers of the place, and to whose enterprise the inhabitants acknowledge much indebtedness for their prosperity and the development of the lumbering interests of the region, has been a patron of your journal since the first issue, and still regards it as indispensable to housekeeping.

About two miles from Boulder Creek, on what is called Bear creek, Mr. W. O. Porter has one of the finest young orchards of the country, principally French prunes. The soil being a sandy loam with clay subsoil, seems especially adapted to this variety of fruit. Midway between Boulder Creek and Felton, three miles from each, is situated Pacific Mills, owned by Mr. Pierce. A new town is here being built, and it seems to have a bright future.

At Felton I found good accommodations at the Central hotel, kept by Mr. I. N. Hayes. The Creamer house, Mrs. M. Cassidy proprietress, has also the reputation of dispensing home comforts to guests. The town was started in 1868 by Walter Cooper, who built the first house. Up to two years ago Felton ranked among the most lovely villages of Santa Cruz county. The narrow-gauge railroad which was built from Santa Cruz to your city, passing on the opposite side of the San Lorenzo river, has left the inhabitants to mourn the day it was built. The principal industries that built up the place were lumbering and lime. The I. X. L. Lime Works, one and a half miles west of town, are among the largest in the State, turning out as high as 30,000 barrels a week. The present population is about 200.

One of the pleasantest drives I have had since I left your city was through the Scott valley, which, on account of its fruitful fields, gardens, and orchards, envied with wooded mountains, from which flowed down clear cold and sparkling waters, I pictured in my imagination as the fairy land. Among the model homes that beautify the valley, we recall those of D. M. Locke, A. S. Hicks and others, old patrons of the *PRESS*. Near the head of the valley lay the Vinehill and Highland districts, famous fruit and wine-producing districts.

On my return to Santa Cruz on the 9th inst., I visited the California Powder Works, and was placed under obligations by Mr. B. Peyton, the superintendent, for courtesies. These works were constructed 25 years ago. The cost is computed at nearly half a million of dollars. The capacity of the works is 15,000 pounds per day. The company employs from 60 to 100 men. An inexhaustible supply of the best powder-producing wood is found in the vicinity—madrone charcoal being used for blasting powder, while alder and willow are utilized in the production of gunpowder. Mr. Peyton's residence is superb and the location on an eminence above the powder works commands a magnificent view of glen and dale, the city of Santa Cruz, the mountains and the sea.

On Sunday, the 11th inst., I stopped at Hall's house, Soquel, four miles south of Santa Cruz, and one mile from the bay. This place, like almost every place I have visited, is claimed by the inhabitants to have a monopoly of climate and most of the other advantages which make life worth living. All I can say concerning the claims advanced is that the weather was quite pleasant during my short stay.

The population is estimated at 300 happy go-away people. The most notable enterprise of the village is the South Coast Paper-Mills, owned by the O'Neil Bros., which turns out 4½ tons of brown paper per day at a cost of about \$90 for running expenses. The value of the product is about \$150, leaving a net income for the company of \$60 per day. F. B. L.

NEW CATTLE COMPANY.—*Reno Gazette*, Dec. 7: The Sun Creek Cattle Co. has been incorporated in Virginia City, which is its principal place of business. The capital stock is \$20,000, divided into shares of \$1000. The trustees are W. J. Hanks, F. E. Fielding, W. J. Westerfield, R. Searls and J. Beresford. The object of the company is the purchase and sale of land and live stock of every description in Nevada. Sun creek is a stream in the southern part of Elko county.

EASTERN IMMIGRANTS or older residents, who are seeking places for new homes or desirable land for farming or fruit-growing colonies, should not fail to read the advertisement of the Santa Ynez Co., which appears in another column.

A PARTY of engineers with three cars loaded with supplies have been sent from Stockton to Oakdale to survey the proposed Southern Pacific extension from Oakdale to Posa, Kern county, along the foothills on the eastern side of the San Joaquin valley.

C. E. WILLIAMS—Yuba and Sutter Co.'s.
DR. STANLEY T. FEET, San Diego Co.

The *Visalia Times* advises farmers who live at a distance from the timber belt, and have to haul their firewood, to cultivate a half acre of Russian sunflowers. They grow to a height of eight or ten feet and a diameter of two to four inches. The stalks when dry make excellent fuel for kitchen use, and the seeds are valuable as chicken feed.

The Bavispe country in Mexico continues to be shaken by earthquakes. So constant have they been since last spring that the people are abandoning that region.

Farmers and Fruit-Growers, Attention!

To grow large and profitable crops and at the same time to make the farm
better each year, is the problem for the farmer.

FERTILIZE! FERTILIZE!
NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.
Dr. J. KOEBIG—Dear Sir: I have analyzed your sample
of "Nitrogenous Superphosphate," with the
following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85
per cent Ammonia, therefore, total of Nitrogen calcu-
lated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vine-
yards, orchards, gardens, farms, and I recommend its
use by the cultivators of the soil generally, in Cali-
fornia. Yours truly,
DR. E. A. SCHNEIDER.

University of California, College of Agri-
culture.
BERKELEY, Nov. 20, 1886.

Dr. J. KOEBIG, San Francisco—Dear Sir: I take pleas-
ure in adding my testimony to that of Dr. Schneider as
to the high quality of the "Nitrogenous Super-
phosphate" Fertilizer, analyzed by him at your re-
quest. It is a high-grade article, and as such re-
turns the user a better money value than a low-grade

Booth's Sure Death Squirrel Poison

For Squirrels, Gophers, Birds, Mice, Etc.

Endorsed by the Grange and Farmers wherever used.
The Cheapest and Best.

Put up in 1-pound, 5-pound, and 5-gallon Tins.
Every Can Warranted.

This Poison has been on the market less than two years, yet in
this short time it has gained a reputation of "Sure Death,"
equaled by none. By its merits alone, with very little advertis-
ing, it is now used extensively all over the Pacific Coast, as well
as in Australia and New Zealand.

S. F. MARKET REPORT

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, Dec. 28, 1887.

Showery, rainy weather, with a lower temperature the latter part of the week, under review, averages the belief that the long-wished-for rains are near at hand. In farm products, trading the past week was fair, with prices well maintained. Eastern telegrams report a strong wheat market, as do English cables. They both give an advance.

Foreign Review.

LONDON, Dec. 26.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: English wheat was slow to sell but values were steady. Foreign wheat was steadier, especially Russian and American red winter. The Liverpool quotation for reds a penny per cental higher. Maize is in fair inquiry, and prices show a hardening tendency. Beans and peas are firm. There has been no market since Friday.

Eastern Wool Markets.

BOSTON, Dec. 24.—The wool sales for the week foot up 2,476,800 pounds, including 239,700 pounds for foreign. The sales include 210,000 pounds California spring and Oregon at 17@18c, and 21,000 pounds California fall at 60c.

NEW YORK, Dec. 24.—The imports of foreign wool since January 1st were 116,088 bales; the previous year, 152,476. Domestic, 149,942; the previous year, 171,977. The wool market up to date showed cautious dealings. The sales of domestic wool amounted to 422,000 pounds, at current rates, and 208 on private terms. None of it was California. California full fine sold at 10 1/2@20c; low grade, 11@17c; spring, fine, 23@24c; medium, 20@22; low, 13@17c; domestic fleeces XXX, 34@35c; XX, 32@34c; X, 31@32c; No. 1, 30@31c; No. 2, 28@30c; common, 26@31c; combing and delaine washed fine, 37@38c; medium, 33@36c; coarse, 30@32c; extra pulled, 28@30c; super, 26@28c; lambs, 28@36c; Territory choice, 24@26c; fair to good, 19@22; coarse and carpet, 16@18c; Texas, Eastern and Northern spring, fine and medium, 19@25c; coarse, 17@19c; fall, 18@19c; Western and Southern spring, 18@22c; fall, 14@21c.

Raisins.

NEW YORK, Dec. 24.—Raisins have indications of a stronger future, and the shortage of the early estimates is deplored.

A prominent house on Saturday marked two crown loose at 15@16c; three crown loose, 17@20c. London layers a/gone to the trade. Valencias have been over-ported, which, with the rain-damaged quality, is making importers lose materially.

Hops.

NEW YORK, Dec. 24.—Several carloads of 1886 hops were sold at 5@6c.

Local Markets.

BAGS—The reported forming of a syndicate is not credited, it being put out to force buyers. But then stocks are well concentrated and holders are trying to force prices up. Calcuttas are a shade firmer at 7 1/2@7 3/4c for June-July delivery.

BARLEY—The sample market closed stronger today. The stock is being rapidly depleted. After the large deliveries of this month are cared for, a higher range of values is looked for. In options trading was fairly active with only slight fluctuations reported. At today's Call the sales reported are as follows:

Morning Session: Buyer season—200 tons, 96 1/2c; 900, 97c; 1500, 96 1/2c. Buyer 1887—200 tons, 87c. Seller 1887—100 tons, 87c @ ct. Afternoon Session: Buyer season—900 tons, 96 1/2c; 500, 96 1/2c. Buyer 1887—200 tons, 87c @ ct.

BUTTER—Pickled butter is all gone, which creates a strong and higher market for other descriptions. Receipts are only fair, while the demand is good.

CHEESE—Choice Californian mild is a shade higher; old stock is slow. Eastern cheese has a firmer tone.

EGGS—The market holds strong and will probably continue so until after next week, as the consumption is free.

FLOUR—The market is firm, but still there is some cutting in prices.

WHEAT—The market is very strong, with holders indifferent. Very few parcels are on the market. Buyers are forced to pay an advance on quotations given to the daily papers. Millers buy freely in Oregon or Valley, but their prices there are higher. In options, trading on Call was fairly active throughout the week, with prices strengthening. At today's Call, sales reported made are as follows:

Morning Session: Buyer season—200 tons, \$1.48 1/2; 500, \$1.48 1/2; 300, \$1.48 1/2; 200, \$1.48 1/2. Buyer 1887—100 tons, \$1.36 1/2 @ ct. Afternoon Session: Spot—400 tons, \$1.36. Buyer season—100 tons, \$1.48 1/2; 100, \$1.48 1/2 @ ct.

[COMMUNICATED.]

Market Information.

The following are the receipts of the principal items of California produce at San Francisco from the beginning of the harvest year to date, compared with the corresponding period in the previous harvest year:

	July 1 to Dec. 25, '86.	July 1 to Dec. 24, '87.
Flour, qr. sks.	2,489,294	1,776,289
Wheat, cts.	8,716,886	4,854,756
Barley, cts.	1,759,130	1,547,980
Oats, cts.	105,402	124,871
Potatoes, sks.	523,437	631,413

Hops, bales.	731	228
Hides, No.	16,106	17,969
Potatoes, sks.	31,632	2,247

Cereals.

English mail advices from the best authorities summarized are as follows: The deliveries of English wheat from farmers have been considerable, and for the month of December have equaled about 750,000 qrs. Prices have not been so firm as they would have been with smaller deliveries, but, on the whole, the burden of heavy local supplies has been well supported. Whether farmers will continue to sell at the rate of 750,000 qrs. a month all through the winter is at least doubtful, but even should they do so the three winter months will have full need of the 2,250,000 qrs. obtainable from this source. Winter wants of wheat may be reckoned at 6,500,000 qrs., so that if farmers deliver 2,250,000 qrs. there will still remain a deficiency of 4,250,000 qrs. for the foreigner and the granary-owner to supply. With respect to the first named, the quantity of wheat and flour on passage and likely to arrive before the end of February is not much over a million qrs., and even with favorable winds for the large Californian fleet due, the imports will not be over 1,250,000 qrs. out of the 1,500,000 qrs. afloat, the remainder going elsewhere. This still leaves 3,000,000 qrs. to be imported from other sources. The Atlantic seaports will furnish say about 1,000,000 qrs., while India is virtually exhausted, pending the harvest in next March, and Russia is dependent on weather. Should mild weather obtain in the Black sea, the shipments from there would aggregate say 250,000 qrs. Estimating that India will furnish a like quantity and other sources 250,000 qrs., still there would be a shortage of 1,300,000 qrs. This will, to all appearances, have to be met out of the reserves in granary, which are about two and a half millions at most. The depletion of stores to the extent of more than one-half is likely to have a marked effect upon trade, and if English farmers should be prevailed upon to abate their deliveries, a strong upward movement immediately after the close of the year would pass from the list of possible to that of probable events.

The London *Farmers' Journal*, Dec. 5, says that "the weather has been for the most part fine and favorable to the outdoor work of the farm. The land is wet on the surface. In places, but for the most part plows up and works kindly. So dry was the soil before the rains came that in many districts the drains are not yet running, and in others only very slightly. All the autumn-sown crops promise well. The wheats look very strong, and so do the winter beans, tares, trifolium, and, in many places, the 'seeds' which were given up for lost."

Recent advices from Australia report sustained favorable conditions of the wheat crop, which is expected to be the largest yet grown. It is expected that South Australia will have a surplus of some 2,000,000 qrs., and in anticipation of liberal receipts spot value is steadily declining. On the other hand, freights are rising, and several charters have been signed at rates above those which were obtainable last season, which will tend to keep prices high.

Mail advices from France report that the wheat trade has been firmer, farmers' offers not exceeding the demand from millers, who are now buying rather freely; accordingly many of the country markets have quoted some improvement, and foreign wheat is also held for more money, although it is very difficult to sell. No. 1 Californian, delivered, duty paid, at Havre, is now quoted at equal to 45s. per 500 lbs., which is the equivalent of 35s. 6d. to 36s. c. i. f. This is from 3d. to 9d. higher than quoted by cables from England on Dec. 4 or at any time up to date, which goes far to show that cable quotations as published in the papers on this coast are lower than the actual market. C. i. f. cost, insurance and freight to United Kingdom. The cost covers the price of grain on this side and all expenses of the wheat delivered on board of ships.

On this coast, Oregon advices report wheat exporters and sellers more or less at deadlock. While the former bid \$1.17 1/2 for Eastern and \$1.25 for valley, they pay an advance quietly so as to give quick dispatch to vessels on berth. Considerable valley is bought there for millers in this city and vicinity.

In this city wheat holds strong, with sellers indifferent, which compels buyers to pay an advance on bids so as to give quick dispatch to vessels on berth. The tonnage loading continues large, notwithstanding the quick loading reported. Charters rule low, with no probability of an advance, owing to the large coal fleet added to list of vessels on the way. Low freights mean better prices to farmers for wheat. The war rumors abroad have much to do with creating a stronger market with us. If there should be war abroad wheat values will make rapid jumps upward. Some of the agricultural districts report plowing about finished, but taken as a whole the season is late and not more than 75 per cent of the grain-land is prepared or can be previous to good soaking rains.

Barley has ruled strong throughout the week, with a free consumption reported. The stock is being rapidly depleted, particularly of the better grades. It is very generally conceded that after the turn of the year better values will obtain. The bulk of the stock is either off color or else light. The husk is thick and weighs more than the grain. Bright, plump barley for both feed and brewing is wanted and commands good prices. Brewers are still sampling and taking up all parcels of choice bright to be had at from \$1.05 to \$1.20, the latter for extra heavy.

Corn is in light stock, as is the supply on this coast. Choice grades are held very strong and hard to get even at outside quotations. Western advices

report the market still tending up, and that the shortage will probably be less than heretofore estimated.

Oats hold strong, with a slight advance obtainable. Receipts continue light. Last year large quantities were sent from Nebraska to this city, but owing to the short crop at the East there will not be any to spare.

Rye and also buckwheat are strong at full figures. Something extra is even placed at a slight advance.

Feedstuff.

Hay is very strong, with offerings of choice very light. Fair to good is in fair supply. The consumption is very large, with no apparent decrease for some time to come, owing to active railroad building and more teams at work.

Ground feed is strong and going quite rapidly into consumption. Bran and middlings are selling at a slight advance on last week's quotations. Feed corn is stiff, while ground barley is strengthening.

Fruits.

Grapes are slow and hard to place, even at concessions.

Apples are firm at full prices for choice Californian and Oregon. Fair to good moves only moderately fair. Eastern are coming in quite freely, and selling at a wide range, \$2 to \$5 per barrel, the price being governed by size and flavor.

Limes and lemons sell high. Oranges are in increasing supply, causing prices to recede slowly. Other tropical fruits are without essential change.

In dried fruits the market is dull and heavy. Any selling pressure is met by low bids, fully 20 per cent less than is quoted elsewhere. Holders are not disposed to sell, but store until the spring of 1888, when a better market is looked for. The stock here and at the East is light, and when the demand next year opens the stock will go into consumption quite rapidly, at good prices.

Eastern mail advices continue to note a strong and active market for choice grades of selected Californian raisins. There are considerable quantities of poor on the market, which are slow and hard to sell. While choice sell at from \$2.25 to \$2.50, and even more per box, the poor sell slowly at \$1.30 to \$1.50 per box. In this market the stock of choice London layers is very light, causing good prices to rule. The demand for all kinds is light, but as the stock is light, it is claimed that much better prices will rule before next season.

Live-Stock.

The demand the past week has run chiefly on choice bullocks for the holidays. The consumption of meats is expected to increase from now on. The market continues steady, with a fairly firm tone reported. Mutton sheep are in fair offering, with a firm market reported. Grain hogs are getting scarce. Packers are more disposed to buy accurately, particularly; so now that hog product is advancing. Cows are hard to sell, owing to high feed and poor pasture.

Matched teams, driving horses and single-footers are in good demand, with light offering of desirable animals for city use. Prices range from \$700 to \$1200 per span for matched teams, \$350 to \$700 for driving horses, and \$400 to \$600 for single-footers. To fetch these prices, good horses must be had.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7 1/2@7 3/4c; first grade, grass fed, 6 1/2@7c @ lb.; second grade, 6@6 1/2c; third grade, 5 1/2@5 3/4c.

MUTTON—Ewes, 5 1/2@6c; wethers, 6@6 1/2c.

LAMB—Spring, 7@8c.

VEAL—Large, 6@7c; small, 6@8c.

PORK—Live hogs, 4 1/2@4 3/4c for heavy and medium; hard dressed, 6 1/2@7c per lb.; acorn fed, 4@4 1/2c; dressed, 5 1/2@6 1/2c; soft hogs, live, 3 1/2@4c. On foot, one-third less for grain or stalled feed, and one-half less for stock running out.

Vegetables.

The market for potatoes is weak for reds, but fairly strong for whites. The supply to draw from is decreasing under free consumption.

Onions are strong for the more choice grades. The demand is free. Off qualities are slow, even at the low range of 50c to 75c per cental.

Cabbages hold strong at full prices, for both shipping and home. The supply of choice hard is light.

Marrowfat squash is in good supply. The demand is reported to be fair.

Root vegetables are steady, with a strong tone.

Dry, cold weather is against early gardening.

Miscellaneous.

In poultry, heavy receipts of dressed hens, roosters, ducks, geese and turkeys from the West, caused the market to ease off on last Saturday, and brought about a lower range of values since then. At the close the market is barely steady.

Game has come in more freely the past week, but moved off well at a slight concession.

Beans continue very strong at the higher quotations. Choice is in light supply, while the East still draws freely.

In hops, there is more inquiry, but holders are indifferent, except at full prices.

Wool continues to move off in small way. The stock is light and assortment poor.

Hog product is again tending up, under a strong market at the West.

There are 37 factories engaged in the manufacture of artificial butter in the United States, and 259 wholesale dealers (March 4, 1887). The quantity manufactured and removed for consumption or sale at 2c per lb., during the months of November and December, 1886, and January, 1887, was 10,029,961 lbs. The quantity exported from the port of New York during this period was 114,697 lbs. These figures are given on the authority of the Hon. J. S. Miller, Commissioner of Internal Revenue, U. S. A.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	314,233	223,317
In port, disengaged.....	114,826	54,767
In port, engaged.....	19,596	57,461

Totals..... 448,655 329,545

To obtain the carrying capacity, add 60 per cent to the tonnage.

San Francisco, Dec. 28, 1887.

THE more originality you have in yourself, the more you see in other people.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations. WEDNESDAY, Dec. 28, 1887.

Jackson Centrifugal Pumps.

JACKSON
Automatic
Expansion
SELF-OILING ENGINES.

Made in ten sizes, from two to sixty-horse power, and carried in stock for prompt delivery

BYRON JACKSON,
625 Sixth St., San Francisco, Cal.

For quantities of water not less than 100 gallons per minute, and for lifts not exceeding 100 feet, there is no better pump than that illustrated in the annexed engraving. It is very simple, durable, and economical. I make them in sizes from 2-inch, 100 gallons per minute, to 24-inch, with a capacity of 14,000 gallons per minute, and am prepared to build larger sizes to order. They must be set within 20 feet of the water; will draw it that far and force it up 90 feet. They are very satisfactory in wells not over 100 feet deep.

BARREN HILL NURSERIES

NEVADA CITY, CAL.

SPECIALTIES:

NUTS, PRUNES AND GRAPES.

The Finest Collection of "Nut-Bearing" Trees to be Found in the United States.

21 Varieties of Walnuts,

INCLUDING

CLUSTER WALNUT (*Juglans Racemosa*).

The newest, most prolific and valuable variety ever introduced into this country.

PRÆPARTURIENS,

Or FERTILE WALNUT, introduced into California in 1871 by Felix Gillet.

"Second" Generation Præparturiens,
(California Grown).

"Second Generation" trees, grown from nuts borne on the original tree; 80 to 90 per cent guaranteed to be "pure," or having retained the characteristics of the original Præparturiens, chief among them the surprising fertility of that type.

Third Generation Præparturiens or common French walnut (*Juglans Regia*), grown from nuts borne on Second Generation trees, all California grown. Vigorous and fertile variety, but the nuts smaller than those of the second generation.

GRAFTED WALNUTS.

Franquette Parisienne, Mayette, Chaberte, Meylan, Vourey and "Weeping" Walnuts, the leading varieties of Europe, highly recommended for the size, beauty and quality of the nuts, fertility, and above all, "hardiness" of the kinds.

We offer this season imported trees of the seven above sorts, expressly grafted for us, regardless of cost. The difficulty in grafting the walnut is such, and grafted walnuts are so rarely so scarce, that we are compelled to decline orders for such trees in quantities over a dozen. Only a limited number of trees of each kind from four to six feet.

"MARRONS," or French Chestnuts.

(Solely propagated from grafting.)

MARRON COMBALE (California grown).

10 Varieties of the finest kinds of Marron-Chestnuts to be found anywhere; at the head of the 1st "Marron Comble," which we have been fruiting upon our place the last 13 years; very large and sweet nut, prolific; one of the very best for market.

7 Varieties of Filberts.

4 Varieties of Almonds.

4 Varieties of April Cherries, the earliest and most prolific in California.

245 Varieties of Grapes, from all parts of the world, including the earliest Table Varieties known, some of them 25 days earlier than Sweet Water.

61 Varieties of English Gooseberries, all shapes and colors, some large as walnuts; all "true to name."

CORK OAK, 2-year-old Trees, from Spain.

Prunes! Prunes!

Lot D'Ente, or D'Ente "true from the root," one of the best and finest types of the "French Prune" and the kind so extensively cultivated in the prune district of France. This type is not propagated from grafting, which would do away with its chief qualities of being more vigorous, more long-lived than grafted trees, and a "gum-resistant" stock.

Also, the finest grafted types from the home of the Prune D'Ente or D'Agen, on Myrobalan, St. Julien and Almond stock.

Saint Catherine (true from the root), one of the finest desert Plums, and one of the best for preserving and drying.

Puymirrol D'Ente, Blue and Red Perdigran, German and Italian Quetsche, Alsace Quetsche, Knight's Green Drying, etc.

Apricots, Peaches, Pears,

Quinces, Plums, Mulberries,

Figs, Fancy Fruits, Etc.

FRENCH, ENGLISH, GERMAN AND AMERICAN

STRAWBERRIES.

Send for General Descriptive Catalogue, illustrated with forty-one cuts, representing Walnuts, Chestnuts, Filberts, Prunes, Medlar and Sorbus.

FELIX GILLET,

THE

PACIFIC RURAL PRESS.

All branches of Farming, including the keeping and breeding of Horses, Cattle, Sheep, Swine, Bees, Poultry, etc ; Garden, Fruit, Vine, Grain, and Hop Culture; Reliable Market Reports, with other important departments devoted to the Grange, Home Circle, News, etc.

It is the Leading Agricultural Home Newspaper and standard authority on all branches of California Agriculture.

It has the fullest and most accurate REPORTS of HORTICULTURAL MEETINGS, and is the best record of the EXPERIENCE of INDIVIDUAL FARMERS and FRUIT-GROWERS in all parts of the State.

Its market reports are prepared with care and the greatest reliability possible for the benefit of the producer.

THE PACIFIC RURAL PRESS has more circulation and influence in the Pacific States and Territories than all the other agricultural weeklies in the United States combined. Advertisers can reach nearly all the leading reading farmers through its columns.

A well-known horticulturist who was in attendance upon the meetings of fruit-growers, writes; "The greatest praise that could be bestowed on the RURAL PRESS at the late Fruit-Growers' Convention, and which shows, undoubtedly, the well-deserved popularity of that paper, is the fact that almost all the members of that Convention were subscribers to the Press."

It is a Farm and Home Journal of the highest class, pure in tone and well informed on all matters of industrial interest. It is handsomely printed and illustrated. It is a 20-page weekly, and is furnished, postage paid, for \$3 per year in advance. Single copies, 10 cents, prepaid.

What Others Say of the "Rural Press."

PROUD OF THE RURAL. We feel proud of the RURAL PRESS. It is a paper that we are not ashamed to send to our friends in the East. Every farmer on the Pacific Coast should take it, and it is a valuable paper for any one to read. We appreciate your efforts. Long may you live to bless our cause. *James Wood, Santa Barbara Co.*

INVALUABLE. I congratulate you on the general excellence of the RURAL PRESS, and consider it simply invaluable to all residents of the Pacific Coast.—*Frederick C. Sheldon, M. D., Los Angeles Co.*

THE RURAL BEST OF ALL. I take from four to six papers but if I could take but one, I should unhesitatingly choose the PACIFIC RURAL PRESS. *J. M. Asher, San Diego Co.*

Established 1870. Yearly subscription \$3. [Thirteen and one-half months are allowed new subscribers and old subscribers paying \$3, strictly in advance.]

Send for samples. Address,

DEWEY & CO., Publishers,

No. 220 Market Street, San Francisco.
